[17967] Seven in absentia homolog 1 (drosophila) (SIAH1, Accession NP_003022.1) is another GAM100 target gene, herein designated TARGET GENE. SIAH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIAH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAH1 BINDING SITE, designated SEQ ID:6318, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17968] Another function of GAM100 is therefore inhibition of Seven in absentia homolog 1 (drosophila) (SIAH1, Acces-

sion NP_003022.1), a gene which mediates a beta-catenin degradation pathway linking p53 activation to cell cycle control. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAH1.

[17969] The function of SIAH1 has been established by previous studies. Hu et al. (1997) found that SIAH1 and SIAH2 are expressed in many normal and neoplastic tissues, and only subtle differences in their expression were noted. However, 1 of 3 murine homologs, Siah1b, was strongly induced in fibroblasts undergoing apoptotic cell death. While a previous study suggested that sina is a nuclear protein, epitope- labeled sina and SIAH1 proteins were found in the cytoplasm of Drosophila and mammalian cells. Their substantial evolutionary conservation, role in specifying cell fate, and activation in apoptotic cells suggested that the SIAH proteins have important roles in vertebrate development. Furthermore, given the role of sina in Drosophila photoreceptor development, SIAH2 was considered a candidate for the Usher syndrome type 3 (OMIM Ref. No. 276902) gene, which maps to 3q21- q25. Liu et al. (2001) found that SIAH1 interacts with the C terminus of the adenomatous polyposis coli protein (APC;

175100) and promotes degradation of beta- catenin in mammalian cells. The ability of SIAH1 to downregulate beta- catenin signaling was also demonstrated by hy- podorsalization of Xenopus embryos. Unexpectedly, degradation of beta- catenin by SIAH1 was independent of glycogen synthase kinase 3- beta (OMIM Ref. No. 605004)- mediated phosphorylation and did not require the F- box protein BTRC (OMIM Ref. No. 603482). These results indicated that APC and SIAH1 mediate a beta- catenin degradation pathway linking p53 activation to cell cycle control.

[17970]

[17971] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17972] Hu, G.; Chung, Y.- L.; Glover, T.; Valentine, V.; Look, A T.; Fearon, E. R. : Characterization of human homologs of the Drosophila seven in absentia (sina) gene. Genomics 46: 103- 111, 1997. ; and

[17973] Liu, J.; Stevens, J.; Rote, C. A.; Yost, H. J.; Hu, Y.; Neufeld, K. L.; White, R. L.; Matsunami, N. : Siah- 1 mediates a novel beta- catenin degradation pathway linking p53 to the adenomatou.

[17974] Further studies establishing the function and utilities of SIAH1 are found in John Hopkins OMIM database record ID 602212, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 26, member 4 (SLC26A4, Accession NP_000432.1) is another GAM100 target gene, herein designated TARGET GENE. SLC26A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC26A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC26A4 BINDING SITE, designated SEQ ID:851, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17975] Another function of GAM100 is therefore inhibition of Solute carrier family 26, member 4 (SLC26A4, Accession NP_000432.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A4.

[17976] ST18 (Accession NP_055497.1) is another GAM100 target gene, herein designated TARGET GENE. ST18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ST18, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST18 BINDING SITE, designated SEQ ID:12777, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17977] Another function of GAM100 is therefore inhibition of ST18 (Accession NP_055497.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST18.

[17978] Stomatin (STOM, Accession NP_004090.3) is another GAM100 target gene, herein designated TARGET GENE. STOM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STOM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STOM BINDING SITE, designated SEQ ID:4767, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17979] Another function of GAM100 is therefore inhibition of Stomatin (STOM, Accession NP_004090.3) . Accordingly, utilities of GAM100 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with STOM.

[17980] Syntaxin 3a (STX3A, Accession NP_004168.1) is another GAM100 target gene, herein designated TARGET GENE. STX3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STX3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STX3A BINDING SITE, designated SEQ ID:8245, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17981] Another function of GAM100 is therefore inhibition of Syntaxin 3a (STX3A, Accession NP_004168.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX3A.

[17982] Surfeit 6 (SURF6, Accession NP_006744.2) is another GAM100 target gene, herein designated TARGET GENE. SURF6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SURF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of SURF6 BINDING SITE, designated SEQ ID:11475, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17983] Another function of GAM100 is therefore inhibition of Surfeit 6 (SURF6, Accession NP_006744.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF6.

[17984] SV2B (Accession NP_055663.1) is another GAM100 target gene, herein designated TARGET GENE. SV2B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SV2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SV2B BINDING SITE, designated SEQ ID:2730, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17985] Another function of GAM100 is therefore inhibition of SV2B (Accession NP_055663.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2B.

[17986] T-complex 10 (mouse) (TCP10, Accession NP_004601.1) is another GAM100 target gene, herein designated TARGET GENE. TCP10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCP10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCP10 BINDING SITE, designated SEQ ID:15502, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17987] Another function of GAM100 is therefore inhibition of T-complex 10 (mouse) (TCP10, Accession NP_004601.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCP10.

[17988] Transforming growth factor, alpha (TGFA, Accession NP_003227.1) is another GAM100 target gene, herein designated TARGET GENE. TGFA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:4927, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17989] Another function of GAM100 is therefore inhibition of Transforming growth factor, alpha (TGFA, Accession NP_003227.1), a gene which is able to bind to the egf receptor and to act synergistically with tgf beta to promote anchorage- independent cell proliferation in soft agar. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA.

[17990] The function of TGFA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Tumor necrosis factor (ligand) superfamily, member 15 (TNFSF15, Accession NP_005109.2) is another GAM100 target gene, herein designated TARGET GENE. TNFSF15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFSF15 BINDING SITE, designated SEQ

ID:1209, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17991] Another function of GAM100 is therefore inhibition of Tumor necrosis factor (ligand) superfamily, member 15 (TNFSF15, Accession NP_005109.2), a gene which acts as an autocrine factor to induce apoptosis in endothelial cells. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF15.

[17992] The function of TNFSF15 has been established by previous studies. Zhai et al. (1999) found that expression of a recombinant soluble form of VEGI inhibited the growth of colon carcinomas in mice, and the tumors expressing the soluble VEGI had markedly reduced vascularization. Conditioned media from cells expressing soluble VEGI dramatically inhibited proliferation of bovine aortic endothelial cells. Zhai et al. (1999) concluded that VEGI is an angiogenesis inhibitor that functions in part by directly inhibiting endothelial cell proliferation. Yue et al. (1999) reported that TL1 causes endothelial cell apoptosis via activation of the stress protein kinases SAPK/JNK (see OMIM Ref. No. 601158) and p38 MAPK (see OMIM Ref. No. 600289) and the caspases, primarily caspase- 3 (OMIM

Ref. No. 600636). By functional analysis, Migone et al. (2002) showed that TL1A, but not TL1, induces nuclear factor kappa- B (NFKB; OMIM Ref. No. 164011) activation in cells expressing DR3. Exposure of T lymphocytes, but not other cells, to TL1A enhanced IL2 receptor- alpha (IL2RA; 147730) and IL2 receptor- beta (IL2RB; 146710) expression on these cells, increased proliferation in response to IL2 (OMIM Ref. No. 147680), and induced secretion of IFNG and granulocyte- macrophage colony-stimulating factor (GMCSF, or CSF2; 138960), but not other cytokines, especially in the presence of anti- CD28 (OMIM Ref. No. 186760) costimulation. Exposure of an erythroleukemic cell line (TF- 1), but not activated T cells, to TL1A induced caspase activation and cell death, particularly when protein synthesis was inhibited. Migone et al. (2002) showed that treatment of mice with recombinant TL1A strongly enhanced graft- versus- host reactivity, consistent with DR3 being mainly expressed on activated T cells.

[17993]

[17994] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17995] Yue, T.- L.; Ni, J.; Romanic, A. M.; Gu, J.- L.; Keller, P.; Wang, C.; Kumar, S.; Yu, G.; Hart, T. K.; Wang, X.; Xia, Z.; DeWolf, W. E., Jr.; Feuerstein, G. Z. : TL1, a novel tumor necrosis factor- like cytokine, induces apoptosis in endothelial cells: involvement of activation of stress protein kinases (stress- activated protein kinase and p38 mitogen- activated protein kinase) and caspase- 3- like protease. J. Biol. Chem. 274: 1479- 1486, 1999. ; and

[17996] Zhai, Y.; Ni, J.; Jiang, G.- W.; Lu, J.; Xing, L.; Lincoln, C.; Carter, K. C.; Janat, F.; Kozak, D.; Xu, S.; Rojas, L.; Aggarwal, B. B.; Ruben, S.; Li, L.- Y.; Gentz, R.; Yu, G.- L. : VEGI.

[17997] Further studies establishing the function and utilities of TNFSF15 are found in John Hopkins OMIM database record ID 604052, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tripartite motif-containing 38 (TRIM38, Accession NP_006346.1) is another GAM100 target gene, herein designated TARGET GENE. TRIM38 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIM38, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM38 BINDING SITE, designated

SEQ ID:13589, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17998] Another function of GAM100 is therefore inhibition of Tripartite motif-containing 38 (TRIM38, Accession NP_006346.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM38.

[17999] Ubx domain containing 2 (UBXD2, Accession NP_055422.1) is another GAM100 target gene, herein designated TARGET GENE. UBXD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBXD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBXD2 BINDING SITE, designated SEQ ID:5517, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[18000] Another function of GAM100 is therefore inhibition of Ubx domain containing 2 (UBXD2, Accession NP_055422.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBXD2.

[18001] Ubiquitously transcribed tetratricopeptide repeat gene, y chromosome (UTY, Accession NP_009056.2) is another GAM100 target gene, herein designated TARGET GENE. UTY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UTY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UTY BINDING SITE, designated SEQ ID:2880, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[18002] Another function of GAM100 is therefore inhibition of Ubiquitously transcribed tetratricopeptide repeat gene, y chromosome (UTY, Accession NP_009056.2), a gene which is an ubiquitous tetratricopeptide repeat protein with unknown function. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UTY.

[18003] The function of UTY has been established by previous studies. Greenfield et al. (1996) described a mouse Y-linked gene, Uty, which is widely expressed and encodes a tetratricopeptide repeat (TPR) protein. TPR motifs are found in a variety of functionally distinct proteins and are

believed to mediate protein- protein interaction. The 5.5-kb Uty transcript encodes a 1,186 amino acid protein with 8 TPR motifs in its N terminus. Greenfield et al. (1998) reported that the human UTY gene maps to band 5C. This band is known to contain one or more genes functioning in spermatogenesis and a Y- specific growth gene. See 300128 for a description of the X- linked homolog of UTY. Foresta et al. (2000) reported a complete sequence map of the AZFa region (see OMIM Ref. No. 415000), the genomic structure of AZFa genes, and their deletion analysis in 173 infertile men with well- defined spermatogenic alterations. Deletions were found in 9 patients: DBY (OMIM Ref. No. 400010) alone was deleted in 6, DFFRY (USP9Y; 400005) only in 1, and 1 each with USP9Y- DBY or DBY-UTY missing. No patients solely lacked UTY. Patients lacking DBY exhibited either Sertoli cell- only syndrome or severe hypospermatogenesis. The authors suggested that DBY and USP9Y play key roles in the spermatogenic process.

[18004]

[18005] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18006] Greenfield, A.; Scott, D.; Pennisi, D.; Ehrmann, I.; Ellis, P.; Cooper, L.; Simpson, E.; Koopman, P. : An H- YDb epitope is encoded by a novel mouse Y chromosome gene. Nature Genet. 14: 474- 478, 1996. ; and

[18007] Foresta, C.; Ferlin, A.; Moro, E. : Deletion and expression analysis of AZFa genes on the human Y chromosome revealed a major role for DBY in male infertility. Hum. Molec. Genet. 9: 1161- 11.

[18008] Further studies establishing the function and utilities of UTY are found in John Hopkins OMIM database record ID 400009, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vacuolar protein sorting 26 (yeast) (VPS26, Accession NP_004887.2) is another GAM100 target gene, herein designated TARGET GENE. VPS26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VPS26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS26 BINDING SITE, designated SEQ ID:11671, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[18009] Another function of GAM100 is therefore inhibition of

Vacuolar protein sorting 26 (yeast) (VPS26, Accession NP_004887.2), a gene which is a sorting protein- ensures the proper delivery of organelle- specific proteins. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS26.

[18010] The function of VPS26 has been established by previous studies. Haft et al. (2000) used yeast 2- hybrid assays, mutation analysis, and expression in mammalian cells to define the binding interactions among VPS26 and other human orthologs of yeast vacuolar protein sorting proteins, VPS29 (OMIM Ref. No. 606932), SNX1 (OMIM Ref. No. 601272), and VPS35 (OMIM Ref. No. 606931). Their results are consistent with a model in which VPS26 is bound to VPS35 in a multimeric complex. Haft et al. (2000) identified a discrete domain within VPS35 that interacts with VPS26. Gel filtration chromatography of COS-7 cells showed that both recombinant and endogenous VPS proteins coelute as a 220- to 240- kD complex, and in the absence of VPS35, neither VPS26 nor VPS29 is found in the complex. By database searching with the S. cerevisiae and mouse Vps26p/HB58/PEP8 sequences as probe, Haft et al. (2000) identified a human VPS26 EST.

The deduced 327- amino acid protein was predicted to be a soluble protein. Northern blot analysis of multiple human tissues revealed ubiquitous expression of a single transcript of about 3 kb. Highest expression was found in heart, skeletal muscle, kidney, liver, and placenta, with lower expression in brain, spleen, small intestine, and lung, and lowest expression in colon, thymus, and leukocytes.

[18011]

[18012] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18013] Haft, C. R.; de la Luz Sierra, M.; Bafford, R.; Lesniak, M. A.; Barr, V. A.; Taylor, S. I. : Human orthologs of yeast vacuolar protein sorting proteins Vps26, 29, and 35: assembly into multimeric complexes. Molec. Biol. Cell 11: 4105-4116, 2000. ; and

[18014] Mao, M.; Fu, G.; Wu, J.- S.; Zhang, Q.- H.; Zhou, J.; Kan, L.- X.; Huang, Q.- H.; He, K.- L.; Gu, B.- W.; Han, Z.- G.; Shen, Y.; Gu, J.; Yu, Y.- P.; Xu, S.- H.; Wang, Y.- X.; Chen, S.- J.; Chen.

[18015] Further studies establishing the function and utilities of VPS26 are found in John Hopkins OMIM database record

ID 605506, and in cited publications listed in Table 5, which are hereby incorporated by reference.WDFY3 (Accession NP_055806.2) is another GAM100 target gene, herein designated TARGET GENE. WDFY3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by WDFY3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDFY3 BINDING SITE, designated SEQ ID:17077, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[18016] Another function of GAM100 is therefore inhibition of WDFY3 (Accession NP_055806.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDFY3.

[18017] Zinc finger protein 91 homolog (mouse) (ZFP91, Accession NP_444251.1) is another GAM100 target gene, herein designated TARGET GENE. ZFP91 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZFP91, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:2399, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[18018] Another function of GAM100 is therefore inhibition of Zinc finger protein 91 homolog (mouse) (ZFP91, Accession NP_444251.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91.

[18019] ZID (Accession NP_006617.1) is another GAM100 target gene, herein designated TARGET GENE. ZID BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZID, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZID BINDING SITE, designated SEQ ID:19367, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[18020] Another function of GAM100 is therefore inhibition of ZID (Accession NP_006617.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZID.

[18021] Zinc finger protein 75a (ZNF75A, Accession NP_694573.1) is another GAM100 target gene, herein designated TARGET GENE. ZNF75A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF75A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF75A BINDING SITE, designated SEQ ID:6345, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[18022] Another function of GAM100 is therefore inhibition of Zinc finger protein 75a (ZNF75A, Accession NP_694573.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF75A.

[18023]

[18024] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 101 (GAM101), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18025] GAM101 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM101 was detected is described hereinabove with reference to Figs. 8-15.

[18026] GAM101 gene, herein designated GAM GENE, and GAM101 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18027] GAM101 gene encodes a GAM101 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM101 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM101 precursor RNA is designated SEQ ID:43, and is provided hereinbelow with reference to the sequence listing part.

[18028] GAM101 precursor RNA folds onto itself, forming GAM101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18029] GAM101 precursor RNA folds onto itself, forming GAM101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18030] Nucleotide sequence of GAM101 precursor RNA, designated SEQ-ID: 43, and a schematic representation of a predicted secondary folding of GAM101 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18031] An enzyme complex designated DICER COMPLEX, `dices` the GAM101 folded precursor RNA into GAM101 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM101 RNA is desig-

nated SEQ ID:302, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18032] GAM101 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM101 target RNA, herein designated GAM TARGET RNA. GAM101 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18033] GAM101 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM101 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM101 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM101 RNA may have a different number of target

binding sites in untranslated regions of a GAM101 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18034] The complementary binding of GAM101 RNA, herein designated GAM RNA, to target binding sites on GAM101 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM101 target RNA into GAM101 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18035] It is appreciated that GAM101 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM101 target genes. The mRNA of each one of this plurality of GAM101 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM101 RNA, herein designated GAM RNA, and which when bound by GAM101 RNA causes inhibition of translation of respective one or more GAM101 target proteins.

[18036] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM101 gene, herein designated GAM GENE, on one or more GAM101 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18037] It is appreciated that specific functions and accordingly utilities of GAM101 correlate with, and may be deduced from, the identity of the target genes which GAM101 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18038]

[18039]

[18040] Karyopherin alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316.3) is a GAM101 target gene, herein designated TARGET GENE. KPNA6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KPNA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:17036, to the nucleotide sequence of GAM101 RNA, herein designated GAM RNA, also designated SEQ ID:302.

[18041] A function of GAM101 is therefore inhibition of Karyopherin alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316.3) . Accordingly, utilities of GAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6.

[18042] REG-IV (Accession NM_032044.1) is another GAM101 target gene, herein designated TARGET GENE. REG-IV BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by REG-IV, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of REG-IV

BINDING SITE, designated SEQ ID:12913, to the nucleotide sequence of GAM101 RNA, herein designated GAM RNA, also designated SEQ ID:302.

[18043] Another function of GAM101 is therefore inhibition of REG-IV (Accession NM_032044.1) . Accordingly, utilities of GAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REG-IV.

[18044] Serine/threonine kinase 38 (STK38, Accession NM_007271.1) is another GAM101 target gene, herein designated TARGET GENE. STK38 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by STK38, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STK38 BINDING SITE, designated SEQ ID:14993, to the nucleotide sequence of GAM101 RNA, herein designated GAM RNA, also designated SEQ ID:302.

[18045] Another function of GAM101 is therefore inhibition of Serine/threonine kinase 38 (STK38, Accession NM_007271.1) . Accordingly, utilities of GAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38.

[18046] Ubiquitin specific protease 29 (USP29, Accession NM_020903.1) is another GAM101 target gene, herein designated TARGET GENE. USP29 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP29 BINDING SITE, designated SEQ ID:1408, to the nucleotide sequence of GAM101 RNA, herein designated GAM RNA, also designated SEQ ID:302.

[18047] Another function of GAM101 is therefore inhibition of Ubiquitin specific protease 29 (USP29, Accession NM_020903.1) . Accordingly, utilities of GAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP29.

[18048]

[18049] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 102 (GAM102), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18050] GAM102 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM102 was detected is described hereinabove with reference to Figs. 8-15.

[18051] GAM102 gene, herein designated GAM GENE, and GAM102 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18052] GAM102 gene encodes a GAM102 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM102 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM102 precursor RNA is designated SEQ ID:15, and is provided hereinbelow with reference to the sequence listing part.

[18053] GAM102 precursor RNA folds onto itself, forming GAM102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18054] GAM102 precursor RNA folds onto itself, forming GAM102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18055] Nucleotide sequence of GAM102 precursor RNA, designated SEQ-ID: 15, and a schematic representation of a predicted secondary folding of GAM102 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18056] An enzyme complex designated DICER COMPLEX, `dices` the GAM102 folded precursor RNA into GAM102 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM102 RNA is desig-

nated SEQ ID:349, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18057] GAM102 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM102 target RNA, herein designated GAM TARGET RNA. GAM102 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18058] GAM102 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM102 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM102 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM102 RNA may have a different number of target

binding sites in untranslated regions of a GAM102 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18059] The complementary binding of GAM102 RNA, herein designated GAM RNA, to target binding sites on GAM102 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM102 target RNA into GAM102 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18060] It is appreciated that GAM102 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM102 target genes. The mRNA of each one of this plurality of GAM102 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM102 RNA, herein designated GAM RNA, and which when bound by GAM102 RNA causes inhibition of translation of respective one or more GAM102 target proteins.

[18061] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM102 gene, herein designated GAM GENE, on one or more GAM102 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18062] It is appreciated that specific functions and accordingly utilities of GAM102 correlate with, and may be deduced from, the identity of the target genes which GAM102 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18063]

[18064]

[18065] LOC137829 (Accession XM_059923.2) is a GAM102 target gene, herein designated TARGET GENE. LOC137829 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC137829, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC137829 BINDING SITE, designated SEQ ID:5436, to the nucleotide sequence of GAM102 RNA, herein designated GAM RNA, also designated SEQ ID:349.

[18066] A function of GAM102 is therefore inhibition of LOC137829 (Accession XM_059923.2) . Accordingly, utilities of GAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137829.

[18067] Zinc finger protein 323 (ZNF323, Accession NM_030899.2) is another GAM102 target gene, herein designated TARGET GENE. ZNF323 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING

SITE, designated SEQ ID:8592, to the nucleotide sequence of GAM102 RNA, herein designated GAM RNA, also designated SEQ ID:349.

[18068] Another function of GAM102 is therefore inhibition of Zinc finger protein 323 (ZNF323, Accession NM_030899.2) . Accordingly, utilities of GAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323.

[18069]

[18070] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 103 (GAM103), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18071] GAM103 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM103 was detected is described hereinabove with reference to Figs. 8-15.

[18072] GAM103 gene, herein designated GAM GENE, and GAM103 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18073] GAM103 gene encodes a GAM103 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM103 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM103 precursor RNA is designated SEQ ID:132, and is provided hereinbelow with reference to the sequence listing part.

[18074] GAM103 precursor RNA folds onto itself, forming GAM103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18075] GAM103 precursor RNA folds onto itself, forming GAM103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18076] Nucleotide sequence of GAM103 precursor RNA, designated SEQ-ID: 132, and a schematic representation of a predicted secondary folding of GAM103 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18077] An enzyme complex designated DICER COMPLEX, `dices` the GAM103 folded precursor RNA into GAM103 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM103 RNA is designated SEQ ID:276, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18078] GAM103 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM103 target RNA, herein designated GAM TARGET RNA. GAM103 target RNA comprises three regions, as is typical of mRNA of

a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18079] GAM103 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM103 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM103 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM103 RNA may have a different number of target binding sites in untranslated regions of a GAM103 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18080] The complementary binding of GAM103 RNA, herein des-

ignated GAM RNA, to target binding sites on GAM103 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM103 target RNA into GAM103 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18081] It is appreciated that GAM103 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM103 target genes. The mRNA of each one of this plurality of GAM103 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM103 RNA, herein designated GAM RNA, and which when bound by GAM103 RNA causes inhibition of translation of respective one or more GAM103 target proteins.

[18082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM103 gene, herein designated GAM GENE, on one or more GAM103 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18083] It is appreciated that specific functions and accordingly utilities of GAM103 correlate with, and may be deduced from, the identity of the target genes which GAM103 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18084]

[18085]

[18086] FLJ13855 (Accession NM_023079.2) is a GAM103 target gene, herein designated TARGET GENE. FLJ13855 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13855, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13855

BINDING SITE, designated SEQ ID:14225, to the nucleotide sequence of GAM103 RNA, herein designated GAM RNA, also designated SEQ ID:276.

[18087] A function of GAM103 is therefore inhibition of FLJ13855 (Accession NM_023079.2) . Accordingly, utilities of GAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13855.

[18088] Inositol 1,4,5-triphosphate receptor, type 3 (ITPR3, Accession NM_002224.1) is another GAM103 target gene, herein designated TARGET GENE. ITPR3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITPR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:4198, to the nucleotide sequence of GAM103 RNA, herein designated GAM RNA, also designated SEQ ID:276.

[18089] Another function of GAM103 is therefore inhibition of Inositol 1,4,5-triphosphate receptor, type 3 (ITPR3, Accession NM_002224.1), a gene which may be responsible for calcium release from intracellular stores. Accordingly, utilities of GAM103 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ITPR3.

[18090] The function of ITPR3 has been established by previous studies. See 147265. Ozcelik et al. (1991) found that a cDNA probe for ITPR3 hybridized to DNA from hybrid cells containing human chromosome 6. In one hybrid that carried 6pter- p21, in the absence of an intact copy of this chromosome, hybridization was observed, thus mapping the gene to 6pter- p21. ITPR3 transduces many hormonal signals that regulate Ca(2+)- dependent processes in the intestinal epithelium. Maranto (1994) described complete sequence of the ITPR3 polypeptide (2,671 amino acids). Primary structure analysis indicated a pattern of conserved and variable regions, characteristic of the particular gene family. Immunocytochemical localization in the intestine was determined. Yamamoto- Hino et al. (1994) likewise mapped the ITPR3 gene to chromosome 6, specifically to 6p21, by isotopic in situ hybridization. They showed that the type 3 receptor was present in all hematopoietic and lymphoma cell lines tested

[18091]

[18092] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[18093] Maranto, A. R. : Primary structure, ligand binding, and localization of the human type 3 inositol 1,4,5- trisphosphate receptor expressed in intestinal epithelium. J. Biol. Chem. 269: 1222- 1230, 1994. ; and

[18094] Ozcelik, T.; Suedhof, T. C.; Francke, U. : The genes for inositol 1,4,5- triphosphate receptors 1 (ITPR1) and 3 (ITPR3) are localized on human chromosomes 3p and 6pter- p21, respectively.

[18095] Further studies establishing the function and utilities of ITPR3 are found in John Hopkins OMIM database record ID 147267, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA1240 (Accession XM_039676.3) is another GAM103 target gene, herein designated TARGET GENE. KIAA1240 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1240, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1240 BINDING SITE, designated SEQ ID:5226, to the nucleotide sequence of GAM103 RNA, herein designated GAM RNA, also designated SEQ ID:276.

[18096] Another function of GAM103 is therefore inhibition of KIAA1240 (Accession XM_039676.3) . Accordingly, utilities of GAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1240.

[18097] KIAA1719 (Accession XM_042936.3) is another GAM103 target gene, herein designated TARGET GENE. KIAA1719 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1719, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:11994, to the nucleotide sequence of GAM103 RNA, herein designated GAM RNA, also designated SEQ ID:276.

[18098] Another function of GAM103 is therefore inhibition of KIAA1719 (Accession XM_042936.3) . Accordingly, utilities of GAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719.

[18099] LOC199692 (Accession NM_145295.1) is another GAM103 target gene, herein designated TARGET GENE. LOC199692 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC199692, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199692 BINDING SITE, designated SEQ ID:7894, to the nucleotide sequence of GAM103 RNA, herein designated GAM RNA, also designated SEQ ID:276.

[18100] Another function of GAM103 is therefore inhibition of LOC199692 (Accession NM_145295.1) . Accordingly, utilities of GAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199692.

[18101]

[18102] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 104 (GAM104), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18103] GAM104 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM104 was detected is described hereinabove with reference to Figs. 8-15.

[18104] GAM104 gene, herein designated GAM GENE, and GAM104 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18105] GAM104 gene encodes a GAM104 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM104 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM104 precursor RNA is designated SEQ ID:137, and is provided hereinbelow with reference to the sequence listing part.

[18106] GAM104 precursor RNA folds onto itself, forming GAM104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18107] GAM104 precursor RNA folds onto itself, forming GAM104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18108] Nucleotide sequence of GAM104 precursor RNA, designated SEQ-ID: 137, and a schematic representation of a predicted secondary folding of GAM104 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18109] An enzyme complex designated DICER COMPLEX, `dices` the GAM104 folded precursor RNA into GAM104 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM104 RNA is designated SEQ ID:355, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18110] GAM104 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM104 target RNA, herein designated GAM TARGET RNA. GAM104 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18111] GAM104 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM104 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM104 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM104 RNA may have a different number of target binding sites in untranslated regions of a GAM104 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18112] The complementary binding of GAM104 RNA, herein designated GAM RNA, to target binding sites on GAM104 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM104 target RNA into GAM104 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18113] It is appreciated that GAM104 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM104 target genes. The mRNA of each one of this plurality of GAM104 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM104 RNA, herein designated GAM RNA, and which when bound by GAM104 RNA causes inhibition of translation of respective one or more GAM104 target proteins.

[18114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM104 gene, herein designated GAM GENE, on one or

more GAM104 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18115] It is appreciated that specific functions and accordingly utilities of GAM104 correlate with, and may be deduced from, the identity of the target genes which GAM104 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18116]

[18117]

[18118] 4-aminobutyrate aminotransferase (ABAT, Accession NP_000654.1) is a GAM104 target gene, herein designated TARGET GENE. ABAT BINDING SITE is a target bind-

ing site found in the 3` untranslated region of mRNA encoded by ABAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABAT BINDING SITE, designated SEQ ID:8488, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18119] A function of GAM104 is therefore inhibition of 4-aminobutyrate aminotransferase (ABAT, Accession NP_000654.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABAT.

[18120] V-abl abelson murine leukemia viral oncogene homolog 2 (arg, abelson-related gene) (ABL2, Accession NP_009298.1) is another GAM104 target gene, herein designated TARGET GENE. ABL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABL2 BINDING SITE, designated SEQ ID:7728, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA,

also designated SEQ ID:355.

[18121] Another function of GAM104 is therefore inhibition of V-abl abelson murine leukemia viral oncogene homolog 2 (arg, abelson-related gene) (ABL2, Accession NP_009298.1), a gene which Cytoplasmic tyrosine kinase of the Abelson subfamily. and therefore may be associated with Acute myeloid leukemia. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of Acute myeloid leukemia, and of other diseases and clinical conditions associated with ABL2.

[18122] The function of ABL2 has been established by previous studies. Kruh et al. (1986) identified a novel oncogene related to ABL (OMIM Ref. No. 189980) in DNA sequences from human plasma. The new sequence, called ARG by the authors, was localized by in situ hybridization and somatic cell analysis to human chromosome 1q24- q25. The detection of a novel 12- kb transcript from this gene in human normal and tumor cells establishes it as a new member of the tyrosine kinase family that is closely related to but distinct from ABL. A constitutional fragile site is located at 1q24- q25. Seldin and Kruh (1989) mapped the mouse homolog (Abll) to chromosome 1 by analysis of segregation with other distal chromosome 1 genetic poly-

morphisms in a panel of DNAs from interspecific back-cross mice. This defined a region of distal mouse chromosome 1 homologous with human chromosome 1q21-q32.

[18123]

[18124] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18125] Kruh, G. D.; King, C. R.; Kraus, M. H.; Popescu, N. C.; Amsbaugh, S. C.; McBride, W. O.; Aaronson, S. A. : A novel human gene closely related to the abl proto- oncogene. Science 234: 1545- 1548, 1986. ; and

[18126] Seldin, M. F.; Kruh, G. D. : Mapping of Abll within a conserved linkage group on distal mouse chromosome 1 syntenic with human chromosome 1 using an interspecific cross. Genomics 4: 221- .

[18127] Further studies establishing the function and utilities of ABL2 are found in John Hopkins OMIM database record ID 164690, and in cited publications listed in Table 5, which are hereby incorporated by reference.V-abl abelson murine leukemia viral oncogene homolog 2 (arg, abelson-related gene) (ABL2, Accession NP_005149.2) is another GAM104 target gene, herein designated TARGET GENE.

ABL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABL2 BINDING SITE, designated SEQ ID:7728, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18128] Another function of GAM104 is therefore inhibition of V-abl abelson murine leukemia viral oncogene homolog 2 (arg, abelson-related gene) (ABL2, Accession NP_005149.2), a gene which Cytoplasmic tyrosine kinase of the Abelson subfamily. and therefore may be associated with Acute myeloid leukemia. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of Acute myeloid leukemia, and of other diseases and clinical conditions associated with ABL2.

[18129] The function of ABL2 has been established by previous studies. Kruh et al. (1986) identified a novel oncogene related to ABL (OMIM Ref. No. 189980) in DNA sequences from human plasma. The new sequence, called ARG by the authors, was localized by in situ hybridization and somatic cell analysis to human chromosome 1q24- q25. The de-

tection of a novel 12- kb transcript from this gene in human normal and tumor cells establishes it as a new member of the tyrosine kinase family that is closely related to but distinct from ABL. A constitutional fragile site is located at 1q24- q25. Seldin and Kruh (1989) mapped the mouse homolog (Abll) to chromosome 1 by analysis of segregation with other distal chromosome 1 genetic polymorphisms in a panel of DNAs from interspecific backcross mice. This defined a region of distal mouse chromosome 1 homologous with human chromosome 1q21-q32.

[18130]

[18131] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18132] Kruh, G. D.; King, C. R.; Kraus, M. H.; Popescu, N. C.; Amsbaugh, S. C.; McBride, W. O.; Aaronson, S. A. : A novel human gene closely related to the abl proto- oncogene. Science 234: 1545- 1548, 1986. ; and

[18133] Seldin, M. F.; Kruh, G. D. : Mapping of Abll within a conserved linkage group on distal mouse chromosome 1 syntenic with human chromosome 1 using an interspecific cross. Genomics 4: 221- .

[18134] Further studies establishing the function and utilities of ABL2 are found in John Hopkins OMIM database record ID 164690, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adenylate cyclase activating polypeptide 1 (pituitary) (ADCYAP1, Accession NP_001108.1) is another GAM104 target gene, herein designated TARGET GENE. ADCYAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADCYAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCYAP1 BINDING SITE, designated SEQ ID:13625, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18135] Another function of GAM104 is therefore inhibition of Adenylate cyclase activating polypeptide 1 (pituitary) (ADCYAP1, Accession NP_001108.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCYAP1.

[18136] Amyotrophic lateral sclerosis 2 (juvenile) chromosome region, candidate 3 (ALS2CR3, Accession NP_055864.1) is

another GAM104 target gene, herein designated TARGET GENE. ALS2CR3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALS2CR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALS2CR3 BINDING SITE, designated SEQ ID:4241, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18137] Another function of GAM104 is therefore inhibition of Amyotrophic lateral sclerosis 2 (juvenile) chromosome region, candidate 3 (ALS2CR3, Accession NP_055864.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR3.

[18138] Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2, Accession NP_055677.1) is another GAM104 target gene, herein designated TARGET GENE. ARNT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING

SITE, designated SEQ ID:7789, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18139] Another function of GAM104 is therefore inhibition of Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2, Accession NP_055677.1), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2.

[18140] The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.BART1 (Accession NP_036238.1) is another GAM104 target gene, herein designated TARGET GENE. BART1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BART1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BART1 BINDING SITE, designated SEQ ID:2233, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18141] Another function of GAM104 is therefore inhibition of BART1 (Accession NP_036238.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BART1.

[18142] Hla-b associated transcript 1 (BAT1, Accession NP_004631.1) is another GAM104 target gene, herein designated TARGET GENE. BAT1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAT1 BINDING SITE, designated SEQ ID:7126, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18143] Another function of GAM104 is therefore inhibition of Hla-b associated transcript 1 (BAT1, Accession NP_004631.1), a gene which associates with the major histocompatibility complex, a negative regulator of inflammation. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAT1.

[18144] The function of BAT1 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) is another GAM104 target gene, herein designated TARGET GENE. BAZ2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAZ2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAZ2A BINDING SITE, designated SEQ ID:6461, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18145] Another function of GAM104 is therefore inhibition of Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2A.

[18146] Brca2 and cdkn1a interacting protein (BCCIP, Accession NP_057651.1) is another GAM104 target gene, herein designated TARGET GENE. BCCIP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BCCIP, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCCIP BINDING SITE, designated SEQ ID:18876, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18147] Another function of GAM104 is therefore inhibition of Brca2 and cdkn1a interacting protein (BCCIP, Accession NP_057651.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCCIP.

[18148] Baculoviral iap repeat-containing 5 (survivin) (BIRC5, Accession NP_001159.1) is another GAM104 target gene, herein designated TARGET GENE. BIRC5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BIRC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BIRC5 BINDING SITE, designated SEQ ID:12241, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18149] Another function of GAM104 is therefore inhibition of

Baculoviral iap repeat-containing 5 (survivin) (BIRC5, Accession NP_001159.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC5.

[18150] Complement component 5 receptor 1 (c5a ligand) (C5R1, Accession NP_001727.1) is another GAM104 target gene, herein designated TARGET GENE. C5R1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C5R1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5R1 BINDING SITE, designated SEQ ID:18094, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18151] Another function of GAM104 is therefore inhibition of Complement component 5 receptor 1 (c5a ligand) (C5R1, Accession NP_001727.1), a gene which has a nonredundant function and is required for mucosal host cell defense in the lung and therefore may be associated with Asthma and pneumonia. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of Asthma and pneumonia, and of other diseases and clinical condi-

tions associated with C5R1.

[18152] The function of C5R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Deleted in azoospermia (DAZ, Accession NP_004072.1) is another GAM104 target gene, herein designated TARGET GENE. DAZ BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DAZ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAZ BINDING SITE, designated SEQ ID:2687, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18153] Another function of GAM104 is therefore inhibition of Deleted in azoospermia (DAZ, Accession NP_004072.1), a gene which may play a role in the germ- cell- specific patterns of RNA splicing and storage and therefore may be associated with Male infertility. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of Male infertility., and of other diseases and clinical conditions associated with DAZ.

[18154] The function of DAZ has been established by previous studies. Cooke et al. (1996) postulated that the DAZ gene product may play a role in the germ- cell- specific patterns of RNA splicing and storage. They isolated the mouse homolog of DAZ and mapped it by fluorescence in situ hybridization to chromosome 17 at position 25.6 cM. Cooke et al. (1996) reported that the predicted protein product of the mouse homolog is highly homologous to that of the human gene. By RT- PCR analysis, they established that transcripts occur only in mouse germ cells. Deletions of the azoospermia factors on the Y chromosome long arm are an important cause of male infertility, and they may involve germ cell- specific genes or ubiquitously expressed genes. Foresta et al. (2001) hypothesized that microdeletions involving genes specifically expressed in germ cells should not alter Sertoli cell function. To examine this, they evaluated the testicular hormonal function in infertile patients affected by severe testiculopathies with and without Yq microdeletions, with particular emphasis on Sertoli cell function. They studied 102 well- characterized infertile patients; 27 had Yq microdeletions, and 75 were classified as idiopathic infertiles. Patients with Yq microdeletions had lower FSH (see

OMIM Ref. No. 136530) and higher inhibin B (see OMIM Ref. No. 147290) plasma concentrations compared to patients without microdeletions, suggesting that Sertoli cell function in Yq- deleted men is only partially altered. Furthermore, patients with deletions involving germ cell-specific genes had higher concentrations of inhibin B compared to patients with deletions of ubiquitously expressed genes. The authors inferred that a specific alteration of germ cells only partially influences Sertoli cell function. The hormonal status of patients without deletions suggested that in such cases the cause of the spermatogenic defect may have damaged both Sertoli and germ cells. Inhibin B production in patients with Yq deletions was about 70% higher than in nondeleted patients, and the functional relationship between FSH and inhibin B was normally preserved.

[18155]

[18156] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18157] Cooke, H. J.; Lee, M.; Kerr, S.; Ruggiu, M. : A murine homologue of the human DAZ gene is autosomal and expressed only in male and female gonads. Hum. Molec.

Genet. 5: 513- 516, 1996. ; and

[18158] Foresta, C.; Bertella, A.; Moro, E.; Roverato, A.; Merico, M.; Ferlin, A. : Sertoli cell function in infertile patients with and without microdeletions of the azoospermia factors on th.

[18159] Further studies establishing the function and utilities of DAZ are found in John Hopkins OMIM database record ID 400003, and in cited publications listed in Table 5, which are hereby incorporated by reference.Deleted in azoospermia (DAZ, Accession XP_088763.3) is another GAM104 target gene, herein designated TARGET GENE. DAZ BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DAZ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAZ BINDING SITE, designated SEQ ID:2687, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18160] Another function of GAM104 is therefore inhibition of Deleted in azoospermia (DAZ, Accession XP_088763.3), a gene which may play a role in the germ- cell- specific patterns of RNA splicing and storage and therefore may

be associated with Male infertility. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of Male infertility., and of other diseases and clinical conditions associated with DAZ.

[18161] The function of DAZ has been established by previous studies. Cooke et al. (1996) postulated that the DAZ gene product may play a role in the germ- cell- specific patterns of RNA splicing and storage. They isolated the mouse homolog of DAZ and mapped it by fluorescence in situ hybridization to chromosome 17 at position 25.6 cM. Cooke et al. (1996) reported that the predicted protein product of the mouse homolog is highly homologous to that of the human gene. By RT- PCR analysis, they established that transcripts occur only in mouse germ cells. Deletions of the azoospermia factors on the Y chromosome long arm are an important cause of male infertility, and they may involve germ cell- specific genes or ubiquitously expressed genes. Foresta et al. (2001) hypothesized that microdeletions involving genes specifically expressed in germ cells should not alter Sertoli cell function. To examine this, they evaluated the testicular hormonal function in infertile patients affected by severe testiculopathies with and without Yq microdeletions, with partic-

ular emphasis on Sertoli cell function. They studied 102 well- characterized infertile patients; 27 had Yq microdeletions, and 75 were classified as idiopathic infertiles. Patients with Yq microdeletions had lower FSH (see OMIM Ref. No. 136530) and higher inhibin B (see OMIM Ref. No. 147290) plasma concentrations compared to patients without microdeletions, suggesting that Sertoli cell function in Yq- deleted men is only partially altered. Furthermore, patients with deletions involving germ cell-specific genes had higher concentrations of inhibin B compared to patients with deletions of ubiquitously expressed genes. The authors inferred that a specific alteration of germ cells only partially influences Sertoli cell function. The hormonal status of patients without deletions suggested that in such cases the cause of the spermatogenic defect may have damaged both Sertoli and germ cells. Inhibin B production in patients with Yq deletions was about 70% higher than in nondeleted patients, and the functional relationship between FSH and inhibin B was normally preserved.

[18163] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[18164] Cooke, H. J.; Lee, M.; Kerr, S.; Ruggiu, M. : A murine homologue of the human DAZ gene is autosomal and expressed only in male and female gonads. Hum. Molec. Genet. 5: 513- 516, 1996. ; and

[18165] Foresta, C.; Bertella, A.; Moro, E.; Roverato, A.; Merico, M.; Ferlin, A. : Sertoli cell function in infertile patients with and without microdeletions of the azoospermia factors on th.

[18166] Further studies establishing the function and utilities of DAZ are found in John Hopkins OMIM database record ID 400003, and in cited publications listed in Table 5, which are hereby incorporated by reference.Deleted in azoospermia 2 (DAZ2, Accession NP_065096.1) is another GAM104 target gene, herein designated TARGET GENE. DAZ2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DAZ2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAZ2 BINDING SITE, designated SEQ ID:2687, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18167] Another function of GAM104 is therefore inhibition of Deleted in azoospermia 2 (DAZ2, Accession NP_065096.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZ2.

[18168] Deleted in azoospermia 3 (DAZ3, Accession NP_065097.1) is another GAM104 target gene, herein designated TARGET GENE. DAZ3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DAZ3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAZ3 BINDING SITE, designated SEQ ID:2687, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18169] Another function of GAM104 is therefore inhibition of Deleted in azoospermia 3 (DAZ3, Accession NP_065097.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZ3.

[18170] DKFZP566D1346 (Accession NP_110443.1) is another GAM104 target gene, herein designated TARGET GENE. DKFZP566D1346 BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by DKFZP566D1346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP566D1346 BINDING SITE, designated SEQ ID:9349, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18171] Another function of GAM104 is therefore inhibition of DKFZP566D1346 (Accession NP_110443.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566D1346.

[18172] DKFZP586C1324 (Accession XP_045876.1) is another GAM104 target gene, herein designated TARGET GENE. DKFZP586C1324 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586C1324, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586C1324 BINDING SITE, designated SEQ ID:2243, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:355.

[18173] Another function of GAM104 is therefore inhibition of DKFZP586C1324 (Accession XP_045876.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586C1324.

[18174] DKFZP586M0622 (Accession NP_056398.1) is another GAM104 target gene, herein designated TARGET GENE. DKFZP586M0622 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586M0622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586M0622 BINDING SITE, designated SEQ ID:15334, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18175] Another function of GAM104 is therefore inhibition of DKFZP586M0622 (Accession NP_056398.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M0622.

[18176] DKFZp761D112 (Accession NP_115673.1) is another

GAM104 target gene, herein designated TARGET GENE. DKFZp761D112 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761D112, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761D112 BINDING SITE, designated SEQ ID:10890, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18177] Another function of GAM104 is therefore inhibition of DKFZp761D112 (Accession NP_115673.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D112.

[18178] Endothelin 3 (EDN3, Accession NP_000105.1) is another GAM104 target gene, herein designated TARGET GENE. EDN3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EDN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDN3 BINDING SITE, designated SEQ ID:20067, to the nu-

cleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18179] Another function of GAM104 is therefore inhibition of Endothelin 3 (EDN3, Accession NP_000105.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDN3.

[18180] Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_004449.1) is another GAM104 target gene, herein designated TARGET GENE. FACL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FACL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:19125, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18181] Another function of GAM104 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_004449.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4.

[18182] Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_075266.1) is another GAM104 target gene, herein designated TARGET GENE. FACL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FACL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:19125, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18183] Another function of GAM104 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_075266.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4.

[18184] FBXW8 (Accession NP_699179.2) is another GAM104 target gene, herein designated TARGET GENE. FBXW8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:2739, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18185] Another function of GAM104 is therefore inhibition of FBXW8 (Accession NP_699179.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[18186] FBXW8 (Accession NP_036306.1) is another GAM104 target gene, herein designated TARGET GENE. FBXW8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:2739, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18187] Another function of GAM104 is therefore inhibition of FBXW8 (Accession NP_036306.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[18188] FLJ10970 (Accession NP_060756.1) is another GAM104 target gene, herein designated TARGET GENE. FLJ10970

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10970, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10970 BINDING SITE, designated SEQ ID:11476, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18189] Another function of GAM104 is therefore inhibition of FLJ10970 (Accession NP_060756.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10970.

[18190] FLJ14825 (Accession NP_116236.1) is another GAM104 target gene, herein designated TARGET GENE. FLJ14825 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14825, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14825 BINDING SITE, designated SEQ ID:7343, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18191] Another function of GAM104 is therefore inhibition of FLJ14825 (Accession NP_116236.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14825.

[18192] FLJ20445 (Accession NP_060294.1) is another GAM104 target gene, herein designated TARGET GENE. FLJ20445 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20445, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:18174, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18193] Another function of GAM104 is therefore inhibition of FLJ20445 (Accession NP_060294.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445.

[18194] FLJ23462 (Accession NP_079119.2) is another GAM104 target gene, herein designated TARGET GENE. FLJ23462 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ23462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:12718, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18195] Another function of GAM104 is therefore inhibition of FLJ23462 (Accession NP_079119.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462.

[18196] Forkhead box e2 (FOXE2, Accession NP_036317.1) is another GAM104 target gene, herein designated TARGET GENE. FOXE2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FOXE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXE2 BINDING SITE, designated SEQ ID:10393, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18197] Another function of GAM104 is therefore inhibition of

Forkhead box e2 (FOXE2, Accession NP_036317.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE2.

[18198] GALNT13 (Accession XP_054951.3) is another GAM104 target gene, herein designated TARGET GENE. GALNT13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GALNT13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALNT13 BINDING SITE, designated SEQ ID:3213, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18199] Another function of GAM104 is therefore inhibition of GALNT13 (Accession XP_054951.3) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT13.

[18200] Golgi complex associated protein 1, 60kda (GOCAP1, Accession NP_073572.2) is another GAM104 target gene, herein designated TARGET GENE. GOCAP1 BINDING SITE is a target binding site found in the 3` untranslated region

of mRNA encoded by GOCAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOCAP1 BINDING SITE, designated SEQ ID:19496, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18201] Another function of GAM104 is therefore inhibition of Golgi complex associated protein 1, 60kda (GOCAP1, Accession NP_073572.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOCAP1.

[18202] Glutamate receptor, metabotropic 7 (GRM7, Accession NP_000835.1) is another GAM104 target gene, herein designated TARGET GENE. GRM7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRM7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRM7 BINDING SITE, designated SEQ ID:862, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18203] Another function of GAM104 is therefore inhibition of

Glutamate receptor, metabotropic 7 (GRM7, Accession NP_000835.1), a gene which is mediated by a g- protein that inhibits adenylate cyclase activity. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM7.

[18204] The function of GRM7 has been established by previous studies. L- glutamate, a major excitatory neurotransmitter, interacts with both ionotropic and metabotropic glutamate receptors. See mGluR3 (OMIM Ref. No. 601115). The metabotropic glutamate receptors (OMIM Ref. No. mGluRs), which are G protein- coupled receptors, have been divided into 3 groups on the basis of sequence homology, putative signal transduction mechanisms, and pharmacologic properties. Group II and group III mGluRs are linked to the inhibition of the cyclic AMP cascade, but differ in their agonist selectivities. Okamoto et al. (1994) isolated cDNAs encoding rat mGluR7. The predicted mGluR7 protein shares the structural profile of other mGluRs, with a signal peptide and a large extracellular domain followed by 7 membrane- spanning domains. This receptor shows a high degree of similarity to the group III receptors mGluR4 (OMIM Ref. No. 604100) and mGluR6

(OMIM Ref. No. 604096) in terms of both amino acid sequence and agonist selectivity. In situ hybridization to rat brain tissues indicated that the mGluR7 gene is expressed widely, unlike mGluR4 and mGluR6. Wu et al. (1998) and Makoff et al. (1996) isolated human brain cDNAs encoding mGluR7. They both reported that the predicted 915-amino acid human protein is 99% identical to rat mGluR7. Wu et al. (1998) stated that the group III human receptors, mGluR7, mGluR4, and mGluR8 (OMIM Ref. No. 601116), share 67 to 70% protein sequence similarity with each other and 42 to 45% similarity with the group I and group II receptors. Using in situ hybridization, Makoff et al. (1996) determined that mGluR7 is expressed in many areas of the human brain, especially in the cerebral cortex, hippocampus, and cerebellum.

[18205]

[18206] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18207] Okamoto, N.; Hori, S.; Akazawa, C.; Hayashi, Y.; Shigemoto, R.; Mizuno, N.; Nakanishi, S. : Molecular characterization of a new metabotropic glutamate receptor mGluR7 coupled to inhibitory cyclic AMP signal transduction. J.

Biol. Chem. 269: 1231- 1236, 1994. ; and

[18208] Wu, S.; Wright, R. A.; Rockey, P. K.; Burgett, S. G.; Arnold, J. S.; Rosteck, P. R., Jr.; Johnson, B. G.; Schoepp, D. D.; Belagaje, R. M. : Group III human metabotropic glutamate recept.

[18209] Further studies establishing the function and utilities of GRM7 are found in John Hopkins OMIM database record ID 604101, and in cited publications listed in Table 5, which are hereby incorporated by reference.H17739 (Accession NP_542403.1) is another GAM104 target gene, herein designated TARGET GENE. H17739 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by H17739, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H17739 BINDING SITE, designated SEQ ID:10958, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18210] Another function of GAM104 is therefore inhibition of H17739 (Accession NP_542403.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

H17739.

[18211] Inhibitor of growth family, member 1 (ING1, Accession NP_005528.2) is another GAM104 target gene, herein designated TARGET GENE. ING1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ING1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ING1 BINDING SITE, designated SEQ ID:15187, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18212] Another function of GAM104 is therefore inhibition of Inhibitor of growth family, member 1 (ING1, Accession NP_005528.2), a gene which acts as a potent growth regulator in normal and in established cells. and therefore may be associated with Squamous cell carcinoma. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of Squamous cell carcinoma, and of other diseases and clinical conditions associated with ING1.

[18213] The function of ING1 has been established by previous studies. Garkavtsev et al. (1996) described a new strategy for the isolation of tumor suppressor genes. This strategy

was based on subtractive hybridization followed by selection of transforming genetic suppressor elements. It was used to isolate a novel gene called ING1 which encodes a 33- kD protein (294 amino acids) that displays the characteristics of a tumor suppressor gene. Garkavtsev et al. (1996) reported that expression of high levels of transfected constructs of this gene inhibited growth, while chronic expression of antisense constructs promoted cell transformation. They observed reduced expression of ING1 in some breast cancer cell lines and mutation of ING1 in neuroblastoma cells. Garkavtsev et al. (1997) showed, using indirect immunofluorescence, that the p33(ING1) protein is located in the nucleus, which is consistent with its proposed role as a growth regulator. By fluorescence in situ hybridization, they localized the ING1 gene to 13q33- q34. Using the radiation hybrid mapping technique, Zeremski et al. (1997) mapped ING1 to 13q34.

[18214]

[18215] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18216] Garkavtsev, I.; Kazarov, A.; Gudkov, A.; Riabowol, K. : Suppression of the novel growth inhibitor p33(ING1) pro-

motes neoplastic transformation. Nature Genet. 14: 415-420, 1996. Note: Erratum: Nature Genet. 23: 373 only, 1999. ; and

[18217] Gunduz, M.; Ouchida, M.; Fukushima, K.; Hanafusa, H.; Etani, T.; Nishioka, S.; Nishizaki, K.; Shimizu, K. : Genomic structure of the human ING1 gene and tumor- specific mutations detected.

[18218] Further studies establishing the function and utilities of ING1 are found in John Hopkins OMIM database record ID 601566, and in cited publications listed in Table 5, which are hereby incorporated by reference.Jun d proto-oncogene (JUND, Accession NP_005345.2) is another GAM104 target gene, herein designated TARGET GENE. JUND BINDING SITE1 and JUND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by JUND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JUND BINDING SITE1 and JUND BINDING SITE2, designated SEQ ID:3027 and SEQ ID:15023 respectively, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18219] Another function of GAM104 is therefore inhibition of Jun

d proto-oncogene (JUND, Accession NP_005345.2), a gene which binds an ap- 1 site. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JUND.

[18220] The function of JUND has been established by previous studies. JUND is the most broadly expressed member of the JUN family and the AP1 transcription factor complex (see OMIM Ref. No. 165160). Weitzman et al. (2000) found that primary fibroblasts lacking murine Jund displayed p53 (OMIM Ref. No. 191170)- dependent growth arrest, upregulated p19(ARF) (see OMIM Ref. No. 600160) expression, and premature senescence. In contrast, immortalized cell lines lacking Jund showed increased proliferation and higher cyclin D1 (CCND1; 168461) levels. These properties were reminiscent of the effects of oncogenic RAS (OMIM Ref. No. 190020) expression on primary and established cell cultures. Furthermore, Jund - /- fibroblasts exhibited increased p53- dependent apoptosis upon ultraviolet irradiation and were sensitive to the cytotoxic effects of tumor necrosis factor- alpha (TNF; 191160). The antiapoptotic role of JUND was confirmed using an in vivo model of TNF- mediated hepatitis. The authors proposed that JUND protects cells from senescence, or apop-

totic responses to stress stimuli, by acting as a modulator of the signaling pathways that link RAS to p53. By fluorescence in situ hybridization, Trask et al. (1993) assigned the JUND gene to 19p13.1- p12. Sullivan et al. (1999) found that the JUND gene contains no introns and is located about 27 kb proximal to PDE4C (OMIM Ref. No. 600128).

[18221]

[18222] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18223] Sullivan, M.; Olsen, A. S.; Houslay, M. D. : Genomic organisation of the human cyclic AMP- specific phosphodiesterase PDE4C gene and its chromosomal localisation to 19p13.1, between RAB3A and JUND. Cell. Signal. 11: 735-742, 1999. ; and

[18224] Weitzman, J. B.; Fiette, L.; Matsuo, K.; Yaniv, M. : JunD protects cells from p53- dependent senescence and apoptosis. Molec. Cell 6: 1109- 1119, 2000.

[18225] Further studies establishing the function and utilities of JUND are found in John Hopkins OMIM database record ID 165162, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA1243

(Accession NP_054767.1) is another GAM104 target gene, herein designated TARGET GENE. KIAA1243 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1243, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1243 BINDING SITE, designated SEQ ID:18193, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18226] Another function of GAM104 is therefore inhibition of KIAA1243 (Accession NP_054767.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1243.

[18227] KIAA1456 (Accession XP_040100.3) is another GAM104 target gene, herein designated TARGET GENE. KIAA1456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:13381, to the

nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18228] Another function of GAM104 is therefore inhibition of KIAA1456 (Accession XP_040100.3) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456.

[18229] KIAA1465 (Accession XP_027396.4) is another GAM104 target gene, herein designated TARGET GENE. KIAA1465 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1465, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:10494, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18230] Another function of GAM104 is therefore inhibition of KIAA1465 (Accession XP_027396.4) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465.

[18231] KIAA1486 (Accession XP_041126.4) is another GAM104

target gene, herein designated TARGET GENE. KIAA1486 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1486 BINDING SITE, designated SEQ ID:19705, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18232] Another function of GAM104 is therefore inhibition of KIAA1486 (Accession XP_041126.4) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1486.

[18233] KIAA1998 (Accession XP_068710.3) is another GAM104 target gene, herein designated TARGET GENE. KIAA1998 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1998, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1998 BINDING SITE, designated SEQ ID:17442, to the nucleotide sequence of GAM104 RNA, herein designated

GAM RNA, also designated SEQ ID:355.

[18234] Another function of GAM104 is therefore inhibition of KIAA1998 (Accession XP_068710.3) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1998.

[18235] LOC114928 (Accession NP_612446.1) is another GAM104 target gene, herein designated TARGET GENE. LOC114928 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC114928, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC114928 BINDING SITE, designated SEQ ID:17875, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18236] Another function of GAM104 is therefore inhibition of LOC114928 (Accession NP_612446.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114928.

[18237] LOC143891 (Accession XP_084661.3) is another GAM104 target gene, herein designated TARGET GENE. LOC143891

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC143891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143891 BINDING SITE, designated SEQ ID:6237, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18238] Another function of GAM104 is therefore inhibition of LOC143891 (Accession XP_084661.3) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143891.

[18239] LOC158376 (Accession XP_098934.1) is another GAM104 target gene, herein designated TARGET GENE. LOC158376 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158376 BINDING SITE, designated SEQ ID:20082, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18240] Another function of GAM104 is therefore inhibition of LOC158376 (Accession XP_098934.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158376.

[18241] LOC282921 (Accession XP_212571.1) is another GAM104 target gene, herein designated TARGET GENE. LOC282921 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282921, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282921 BINDING SITE, designated SEQ ID:7126, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18242] Another function of GAM104 is therefore inhibition of LOC282921 (Accession XP_212571.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282921.

[18243] LOC282957 (Accession XP_212619.1) is another GAM104 target gene, herein designated TARGET GENE. LOC282957 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC282957, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282957 BINDING SITE, designated SEQ ID:7126, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18244] Another function of GAM104 is therefore inhibition of LOC282957 (Accession XP_212619.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282957.

[18245] LOC282963 (Accession XP_210834.1) is another GAM104 target gene, herein designated TARGET GENE. LOC282963 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282963 BINDING SITE, designated SEQ ID:7981, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18246] Another function of GAM104 is therefore inhibition of

LOC282963 (Accession XP_210834.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282963.

[18247] LOC283678 (Accession XP_211159.2) is another GAM104 target gene, herein designated TARGET GENE. LOC283678 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283678, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283678 BINDING SITE, designated SEQ ID:2214, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18248] Another function of GAM104 is therefore inhibition of LOC283678 (Accession XP_211159.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283678.

[18249] LOC284892 (Accession XP_211673.1) is another GAM104 target gene, herein designated TARGET GENE. LOC284892 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284892, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284892 BINDING SITE, designated SEQ ID:1220, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18250] Another function of GAM104 is therefore inhibition of LOC284892 (Accession XP_211673.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284892.

[18251] LOC285837 (Accession XP_209780.1) is another GAM104 target gene, herein designated TARGET GENE. LOC285837 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285837 BINDING SITE, designated SEQ ID:7126, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18252] Another function of GAM104 is therefore inhibition of LOC285837 (Accession XP_209780.1) . Accordingly, utili-

ties of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285837.

[18253] LOC285952 (Accession XP_209821.1) is another GAM104 target gene, herein designated TARGET GENE. LOC285952 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285952, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285952 BINDING SITE, designated SEQ ID:3485, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18254] Another function of GAM104 is therefore inhibition of LOC285952 (Accession XP_209821.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285952.

[18255] LOC285953 (Accession XP_209820.1) is another GAM104 target gene, herein designated TARGET GENE. LOC285953 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285953, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285953 BINDING SITE, designated SEQ ID:14299, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18256] Another function of GAM104 is therefore inhibition of LOC285953 (Accession XP_209820.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285953.

[18257] LOC338819 (Accession XP_290216.1) is another GAM104 target gene, herein designated TARGET GENE. LOC338819 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338819, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338819 BINDING SITE, designated SEQ ID:13795, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18258] Another function of GAM104 is therefore inhibition of LOC338819 (Accession XP_290216.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC338819.

[18259] LOC340628 (Accession XP_291365.1) is another GAM104 target gene, herein designated TARGET GENE. LOC340628 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340628, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340628 BINDING SITE, designated SEQ ID:2687, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18260] Another function of GAM104 is therefore inhibition of LOC340628 (Accession XP_291365.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340628.

[18261] LOC348480 (Accession XP_302773.1) is another GAM104 target gene, herein designated TARGET GENE. LOC348480 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348480, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC348480 BINDING SITE, designated SEQ ID:6255, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18262] Another function of GAM104 is therefore inhibition of LOC348480 (Accession XP_302773.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348480.

[18263] LOC348687 (Accession XP_302853.1) is another GAM104 target gene, herein designated TARGET GENE. LOC348687 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348687, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348687 BINDING SITE, designated SEQ ID:6408, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18264] Another function of GAM104 is therefore inhibition of LOC348687 (Accession XP_302853.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348687.

[18265] LOC51136 (Accession NP_057209.2) is another GAM104 target gene, herein designated TARGET GENE. LOC51136 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51136 BINDING SITE, designated SEQ ID:11206, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18266] Another function of GAM104 is therefore inhibition of LOC51136 (Accession NP_057209.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51136.

[18267] LoopADR (Accession NP_113624.1) is another GAM104 target gene, herein designated TARGET GENE. LoopADR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LoopADR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LoopADR BINDING SITE, designated SEQ ID:3456, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18268] Another function of GAM104 is therefore inhibition of LoopADR (Accession NP_113624.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LoopADR.

[18269] MAPKBP1 (Accession XP_031706.7) is another GAM104 target gene, herein designated TARGET GENE. MAPKBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAPKBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAPKBP1 BINDING SITE, designated SEQ ID:12122, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18270] Another function of GAM104 is therefore inhibition of MAPKBP1 (Accession XP_031706.7) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKBP1.

[18271] Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NP_002421.2) is another GAM104 target gene, herein designated TARGET GENE. MN1 BINDING SITE1 and MN1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MN1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE1 and MN1 BINDING SITE2, designated SEQ ID:5008 and SEQ ID:11831 respectively, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18272] Another function of GAM104 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NP_002421.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1.

[18273] Nucleosome assembly protein 1-like 1 (NAP1L1, Accession NP_004528.1) is another GAM104 target gene, herein designated TARGET GENE. NAP1L1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NAP1L1, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAP1L1 BINDING SITE, designated SEQ ID:19810, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18274] Another function of GAM104 is therefore inhibition of Nucleosome assembly protein 1-like 1 (NAP1L1, Accession NP_004528.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L1.

[18275] Nucleosome assembly protein 1-like 1 (NAP1L1, Accession NP_631946.1) is another GAM104 target gene, herein designated TARGET GENE. NAP1L1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NAP1L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAP1L1 BINDING SITE, designated SEQ ID:19810, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18276] Another function of GAM104 is therefore inhibition of Nucleosome assembly protein 1-like 1 (NAP1L1, Accession

NP_631946.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L1.

[18277] Protocadherin beta 9 (PCDHB9, Accession NP_061992.2) is another GAM104 target gene, herein designated TARGET GENE. PCDHB9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHB9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHB9 BINDING SITE, designated SEQ ID:5387, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18278] Another function of GAM104 is therefore inhibition of Protocadherin beta 9 (PCDHB9, Accession NP_061992.2), a gene which is a potential calcium- dependent cell- adhesion protein. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB9.

[18279] The function of PCDHB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Phospholipase c, delta 4 (PLCD4, Accession

NP_116115.1) is another GAM104 target gene, herein designated TARGET GENE. PLCD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLCD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLCD4 BINDING SITE, designated SEQ ID:4220, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18280] Another function of GAM104 is therefore inhibition of Phospholipase c, delta 4 (PLCD4, Accession NP_116115.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCD4.

[18281] PTD012 (Accession NP_054758.2) is another GAM104 target gene, herein designated TARGET GENE. PTD012 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTD012, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTD012 BINDING SITE, designated SEQ ID:10079, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA,

also designated SEQ ID:355.

[18282] Another function of GAM104 is therefore inhibition of PTD012 (Accession NP_054758.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD012.

[18283] Recombination activating gene 1 (RAG1, Accession NP_000439.1) is another GAM104 target gene, herein designated TARGET GENE. RAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:18485, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18284] Another function of GAM104 is therefore inhibition of Recombination activating gene 1 (RAG1, Accession NP_000439.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1.

[18285] Sodium channel, voltage-gated, type v, alpha polypeptide

(long (electrocardiographic) qt syndrome 3) (SCN5A, Accession NP_000326.2) is another GAM104 target gene, herein designated TARGET GENE. SCN5A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCN5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCN5A BINDING SITE, designated SEQ ID:19424, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18286] Another function of GAM104 is therefore inhibition of Sodium channel, voltage-gated, type v, alpha polypeptide (long (electrocardiographic) qt syndrome 3) (SCN5A, Accession NP_000326.2) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN5A.

[18287] Splicing factor proline/glutamine rich (polypyrimidine tract binding protein associated) (SFPQ, Accession NP_005057.1) is another GAM104 target gene, herein designated TARGET GENE. SFPQ BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFPQ, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFPQ BINDING SITE, designated SEQ ID:9786, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18288] Another function of GAM104 is therefore inhibition of Splicing factor proline/glutamine rich (polypyrimidine tract binding protein associated) (SFPQ, Accession NP_005057.1), a gene which binds intronic polypyrimidine tracts. Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFPQ.

[18289] The function of SFPQ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Testis expressed sequence 11 (TEX11, Accession NP_112566.1) is another GAM104 target gene, herein designated TARGET GENE. TEX11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TEX11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TEX11 BINDING SITE, designated

SEQ ID:12751, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18290] Another function of GAM104 is therefore inhibition of Testis expressed sequence 11 (TEX11, Accession NP_112566.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX11.

[18291] Testis expressed sequence 14 (TEX14, Accession NP_112562.1) is another GAM104 target gene, herein designated TARGET GENE. TEX14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TEX14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TEX14 BINDING SITE, designated SEQ ID:6837, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18292] Another function of GAM104 is therefore inhibition of Testis expressed sequence 14 (TEX14, Accession NP_112562.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX14.

[18293] Wd repeat domain 5 (WDR5, Accession NP_438172.1) is another GAM104 target gene, herein designated TARGET GENE. WDR5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WDR5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDR5 BINDING SITE, designated SEQ ID:9726, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18294] Another function of GAM104 is therefore inhibition of Wd repeat domain 5 (WDR5, Accession NP_438172.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR5.

[18295] Zinc finger, dhhc domain containing 2 (ZDHHC2, Accession NP_057437.1) is another GAM104 target gene, herein designated TARGET GENE. ZDHHC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZDHHC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:7683, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18296] Another function of GAM104 is therefore inhibition of Zinc finger, dhhc domain containing 2 (ZDHHC2, Accession NP_057437.1) . Accordingly, utilities of GAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2.

[18297] Zinc finger protein 339 (ZNF339, Accession NP_067043.1) is another GAM104 target gene, herein designated TARGET GENE. ZNF339 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF339, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF339 BINDING SITE, designated SEQ ID:10412, to the nucleotide sequence of GAM104 RNA, herein designated GAM RNA, also designated SEQ ID:355.

[18298] Another function of GAM104 is therefore inhibition of Zinc finger protein 339 (ZNF339, Accession NP_067043.1) . Accordingly, utilities of GAM104 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with ZNF339.

[18299]

[18300] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 105 (GAM105), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18301] GAM105 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM105 was detected is described hereinabove with reference to Figs. 8-15.

[18302] GAM105 gene, herein designated GAM GENE, and GAM105 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18303] GAM105 gene encodes a GAM105 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM105 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM105 precursor RNA is designated SEQ ID:138, and is provided hereinbelow with reference to the sequence list-

ing part.

[18304] GAM105 precursor RNA folds onto itself, forming GAM105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18305] GAM105 precursor RNA folds onto itself, forming GAM105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18306] Nucleotide sequence of GAM105 precursor RNA, designated SEQ-ID: 138, and a schematic representation of a predicted secondary folding of GAM105 folded precursor RNA are further described with reference to Table 2,

hereby incorporated by reference.

[18307] An enzyme complex designated DICER COMPLEX, `dices` the GAM105 folded precursor RNA into GAM105 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM105 RNA is designated SEQ ID:318, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18308] GAM105 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM105 target RNA, herein designated GAM TARGET RNA. GAM105 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18309] GAM105 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM105 target RNA, herein des-

ignated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM105 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM105 RNA may have a different number of target binding sites in untranslated regions of a GAM105 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18310] The complementary binding of GAM105 RNA, herein designated GAM RNA, to target binding sites on GAM105 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM105 target RNA into GAM105 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18311] It is appreciated that GAM105 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM105 target genes. The mRNA of each one of this plurality of GAM105 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM105 RNA, herein designated GAM RNA, and which when bound by GAM105 RNA causes inhibition of translation of respective one or more GAM105 target proteins.

[18312] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM105 gene, herein designated GAM GENE, on one or more GAM105 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have

not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18313] It is appreciated that specific functions and accordingly utilities of GAM105 correlate with, and may be deduced from, the identity of the target genes which GAM105 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18314]

[18315]

[18316] Atpase, class v, type 10d (ATP10D, Accession NM_020453.2) is a GAM105 target gene, herein designated TARGET GENE. ATP10D BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ATP10D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP10D BINDING SITE, designated SEQ ID:13724, to the nucleotide sequence of GAM105 RNA, herein designated GAM RNA, also designated SEQ ID:318.

[18317] A function of GAM105 is therefore inhibition of Atpase, class v, type 10d (ATP10D, Accession NM_020453.2) . Ac-

cordingly, utilities of GAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10D.

[18318] Collagen, type xix, alpha 1 (COL19A1, Accession NM_001858.2) is another GAM105 target gene, herein designated TARGET GENE. COL19A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL19A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:19700, to the nucleotide sequence of GAM105 RNA, herein designated GAM RNA, also designated SEQ ID:318.

[18319] Another function of GAM105 is therefore inhibition of Collagen, type xix, alpha 1 (COL19A1, Accession NM_001858.2), a gene which may act as a cross- bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of GAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1.

[18320] The function of COL19A1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM94.1.DKFZP727G051 (Accession XM_045308.6) is another GAM105 target gene, herein designated TARGET GENE. DKFZP727G051 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP727G051, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP727G051 BINDING SITE, designated SEQ ID:6512, to the nucleotide sequence of GAM105 RNA, herein designated GAM RNA, also designated SEQ ID:318.

[18321] Another function of GAM105 is therefore inhibition of DKFZP727G051 (Accession XM_045308.6) . Accordingly, utilities of GAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727G051.

[18322] Eyes absent homolog 3 (drosophila) (EYA3, Accession NM_001990.2) is another GAM105 target gene, herein designated TARGET GENE. EYA3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EYA3, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA3 BINDING SITE, designated SEQ ID:15188, to the nucleotide sequence of GAM105 RNA, herein designated GAM RNA, also designated SEQ ID:318.

[18323] Another function of GAM105 is therefore inhibition of Eyes absent homolog 3 (drosophila) (EYA3, Accession NM_001990.2), a gene which may be involved in development of the eye. Accordingly, utilities of GAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA3.

[18324] The function of EYA3 has been established by previous studies. Abdelhak et al. (1997) identified 3 members of a novel family homologous to Drosophila 'eyes absent' gene (eya). One of these, EYA1 (OMIM Ref. No. 601653), was demonstrated to be mutant in cases of branchiootorenal dysplasia (BOR; 113650). EYA2 (OMIM Ref. No. 601654) and EYA3, like EYA1, are expressed in the ninth week of human development and may also underlie developmental defects. Xu et al. (1997) showed that in the limbs of 10.5-day mouse embryos, Eya1 expression was largely restricted to the flexor tendons, whereas Eya2 was expressed in the extensor tendons and probably also in the

ligments of the phalanges. They demonstrated that the proline/serine/threonine- rich N- terminal regions of the protein products of the Eya1, Eya2, and Eya3 genes have transcriptional activator activity. These results supported a role for the Eya genes in connective tissue patterning in the limbs. Zimmerman et al. (1997) mapped the murine Eya3 gene to mouse chromosome 4 in the region syntenic with human 1p36. In the mouse, no recombination was detected between the Eya3 gene and the gene encoding the oncogene FGR (OMIM Ref. No. 164940) which is located on 1p36.2- p36.1. By fluorescence in situ hybridization, Zimmerman et al. (1997) established that the human EYA3 gene is on 1p36.

[18325]

[18326] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18327] Abdelhak, S.; Kalatzis, V.; Heilig, R.; Compain, S.; Samson, D.; Vincent, C.; Weil, D.; Cruaud, C.; Sahly, I.; Leibovici, M.; Bitner- Glindzicz, M.; Francis, M.; Lacombe, D.; Vigneron, J.; Charachon, R.; Boven, K.; Bedbeder, P.; Van Regemorter, N.; Weissenbach, J.; Petit, C. : A human homologue of the Drosophila eyes absent gene underlies bran-

chio- oto- renal (BOR) syndrome and identifies a novel gene family. Nature Genet. 15: 157- 164, 1997. ; and

[18328] Xu, P.- X.; Cheng, J.; Epstein, J. A.; Maas, R. L. : Mouse Eya genes are expressed during limb tendon development and encode a transcriptional activation function. Proc. Nat. Acad. Sci.

[18329] Further studies establishing the function and utilities of EYA3 are found in John Hopkins OMIM database record ID 601655, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA1550 (Accession XM_039393.3) is another GAM105 target gene, herein designated TARGET GENE. KIAA1550 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1550, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:16950, to the nucleotide sequence of GAM105 RNA, herein designated GAM RNA, also designated SEQ ID:318.

[18330] Another function of GAM105 is therefore inhibition of KIAA1550 (Accession XM_039393.3) . Accordingly, utilities of GAM105 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1550.

[18331] Solute carrier family 12 (potassium/chloride transporters), member 7 (SLC12A7, Accession NM_006598.1) is another GAM105 target gene, herein designated TARGET GENE. SLC12A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC12A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:17473, to the nucleotide sequence of GAM105 RNA, herein designated GAM RNA, also designated SEQ ID:318.

[18332] Another function of GAM105 is therefore inhibition of Solute carrier family 12 (potassium/chloride transporters), member 7 (SLC12A7, Accession NM_006598.1), a gene which is a potassium/chloride- cotransporter. Accordingly, utilities of GAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7.

[18333] The function of SLC12A7 has been established by previous studies. By searching EST databases, Mount et al. (1999) identified a cDNA encoding SLC12A7, which they

initially termed KCC3 but later renamed KCC4. The deduced 1,083- amino acid SLC12A7 protein contains 12 membrane- spanning segments, 8 phosphorylation sites, 7 of which are in the C terminus, and 4 potential N- glycosylation sites. SLC12A7 shares 65% amino acid identity with SLC12A4 (OMIM Ref. No. 604119) and 66% identity with SLC12A6 (OMIM Ref. No. 604878). Northern blot analysis detected a 5.3- kb SLC12A7 transcript in most tissues tested, with highest expression in heart and kidney and little or no expression in adult brain. Functional analysis confirmed that SLC12A7 is a KCC.

[18334] Animal model experiments lend further support to the function of SLC12A7. Boettger et al. (2002) generated mice constitutively lacking KCC4, which is predominantly expressed in kidney, heart, lung, and liver. Kcc4 - /- mice were born at the expected mendelian ratio. They were viable and fertile; however, their body weight was roughly 90% that of their littermates. Mice had normal hearing loss at postnatal day 14, indicated by normal auditory brainstem responses. Hearing deteriorated quickly during the following week, after which mice were nearly deaf, with a hearing loss of 70 to 80 decibels. Histologic analysis revealed that the inner ear developed normally and could

not be distinguished from those of wildtype animals at postnatal day 14. At postnatal day 21, however, outer hair cells of basal turns of the cochlea were almost totally absent, whereas inner hair cells were still present. The degeneration proceeded from basal to apical turns. In adult knockout mice, the organ of Corti was lost completely in basal turns. In apical turns, some hair cells survived, accounting for the residual hearing ability in adult mice. Even in adult mice, there was no collapse of the Reissner membrane, which separates the scala media from the scala vestibuli, suggesting that Kcc4 is not essential for endolymph production. Outer hair cells of Kcc4 - /- mice degenerated before Deiters cells were lost, although Deiters cells and not outer hair cells normally express Kcc4 at this stage. This is consistent with a disturbance of extracellular homeostasis due to impaired salt uptake by Deiters cells, and may lead to death of outer hair cells by osmotic stress or membrane depolarization. Deafness in Kcc4 - /- mice was associated with renal tubular acidosis. The urine of knockout mice was more alkaline than that of wildtype littermates, whereas concentrations of sodium, potassium, and chloride were not changed. Blood gas analysis indicated a compensated metabolic acidosis with

significantly decreased base excess. Immunofluorescence revealed that Kcc4 is expressed in basolateral membranes of several nephron segments. Intracellular chloride concentration was increased in proximal tubules and particularly in alpha- intercalated cells of knockout mice. Considering the prominent chloride/bicarbonate exchange activity in alpha- intercalated cells, the rise in intracellular chloride predicts a more alkaline intracellular pH in the knockout mice. This will decrease apical proton secretion by increasing the electrochemical gradient against which pumping has to occur. Thus, KCC4 joins the hydrogen ATPase (OMIM Ref. No. 192132) and AE1 anion exchanger (OMIM Ref. No. 109270) as the third transport protein of alpha- intercalated cells whose mutation entails renal tubular acidosis. Boettger et al. (2002) concluded that KCC4 is important for potassium recycling by siphoning potassium ions after their exit from outer hair cells into supporting Deiters cells, where potassium enters the gap junction pathway.

[18335] It is appreciated that the abovementioned animal model for SLC12A7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[18336] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18337] Mount, D. B.; Mercado, A.; Song, L.; Xu, J.; George, A. L., Jr.; Delpire, E.; Gamba, G. : Cloning and characterization of KCC3 and KCC4, new members of the cation- chloride cotransporter gene family. J. Biol. Chem. 274: 16355-16362, 1999. ; and

[18338] Boettger, T.; Hubner, C. A.; Maler, H.; Rust, M. B.; Beck, F. X.; Jentsch, T. J. : Deafness and renal tubular acidosis in mice lacking the K- Cl co- transporter Kcc4. Nature 416: 874- 878, 20.

[18339] Further studies establishing the function and utilities of SLC12A7 are found in John Hopkins OMIM database record ID 604879, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[18340] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 106 (GAM106), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18341] GAM106 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM106 was detected is described hereinabove with reference to Figs. 8-15.

[18342] GAM106 gene, herein designated GAM GENE, and GAM106 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18343] GAM106 gene encodes a GAM106 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM106 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM106 precursor RNA is designated SEQ ID:173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:173 is located at position 13445376 relative to chromosome 20.

[18344] GAM106 precursor RNA folds onto itself, forming GAM106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[18345] GAM106 precursor RNA folds onto itself, forming GAM106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18346] Nucleotide sequence of GAM106 precursor RNA, designated SEQ-ID: 173, and a schematic representation of a predicted secondary folding of GAM106 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18347] An enzyme complex designated DICER COMPLEX, `dices` the GAM106 folded precursor RNA into GAM106 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy

Group: B) nucleotide sequence of GAM106 RNA is designated SEQ ID:231, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18348] GAM106 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM106 target RNA, herein designated GAM TARGET RNA. GAM106 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18349] GAM106 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM106 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM106 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limit-

ing GAM106 RNA may have a different number of target binding sites in untranslated regions of a GAM106 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18350] The complementary binding of GAM106 RNA, herein designated GAM RNA, to target binding sites on GAM106 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM106 target RNA into GAM106 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18351] It is appreciated that GAM106 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM106 target genes. The mRNA of each one of this plurality of GAM106 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM106 RNA, herein designated GAM RNA, and which when bound by GAM106 RNA causes inhibition of translation of respective one or more GAM106 target proteins.

[18352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM106 gene, herein designated GAM GENE, on one or more GAM106 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18353] It is appreciated that specific functions and accordingly utilities of GAM106 correlate with, and may be deduced from, the identity of the target genes which GAM106 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18354]

[18355]

[18356] AD024 (Accession NP_065726.1) is a GAM106 target gene, herein designated TARGET GENE. AD024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AD024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AD024 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18357] A function of GAM106 is therefore inhibition of AD024 (Accession NP_065726.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD024.

[18358] AEBP2 (Accession NP_694939.1) is another GAM106 target gene, herein designated TARGET GENE. AEBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AEBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AEBP2 BINDING SITE, designated SEQ ID:20032, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA,

also designated SEQ ID:231.

[18359] Another function of GAM106 is therefore inhibition of AEBP2 (Accession NP_694939.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AEBP2.

[18360] C14orf77 (Accession XP_085101.1) is another GAM106 target gene, herein designated TARGET GENE. C14orf77 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf77, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf77 BINDING SITE, designated SEQ ID:17031, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18361] Another function of GAM106 is therefore inhibition of C14orf77 (Accession XP_085101.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf77.

[18362] Chromosome 20 open reading frame 142 (C20orf142, Accession XP_300782.1) is another GAM106 target gene, herein designated TARGET GENE. C20orf142 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf142 BINDING SITE, designated SEQ ID:17640, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18363] Another function of GAM106 is therefore inhibition of Chromosome 20 open reading frame 142 (C20orf142, Accession XP_300782.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf142.

[18364] Chromosome 20 open reading frame 147 (C20orf147, Accession NP_689880.1) is another GAM106 target gene, herein designated TARGET GENE. C20orf147 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf147 BINDING SITE, designated SEQ ID:4450, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18365] Another function of GAM106 is therefore inhibition of Chromosome 20 open reading frame 147 (C20orf147, Accession NP_689880.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf147.

[18366] CYCS (Accession NP_061820.1) is another GAM106 target gene, herein designated TARGET GENE. CYCS BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYCS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYCS BINDING SITE, designated SEQ ID:6813, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18367] Another function of GAM106 is therefore inhibition of CYCS (Accession NP_061820.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYCS.

[18368] DKFZP564D172 (Accession NP_114431.2) is another GAM106 target gene, herein designated TARGET GENE. DKFZP564D172 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D172, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564D172 BINDING SITE, designated SEQ ID:4872, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18369] Another function of GAM106 is therefore inhibition of DKFZP564D172 (Accession NP_114431.2) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D172.

[18370] DKFZp761A078 (Accession XP_089143.5) is another GAM106 target gene, herein designated TARGET GENE. DKFZp761A078 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761A078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761A078 BINDING SITE, designated SEQ ID:2068, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18371] Another function of GAM106 is therefore inhibition of DKFZp761A078 (Accession XP_089143.5) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761A078.

[18372] Fibroblast growth factor 5 (FGF5, Accession NP_149134.1) is another GAM106 target gene, herein designated TAR-

GET GENE. FGF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FGF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18373] Another function of GAM106 is therefore inhibition of Fibroblast growth factor 5 (FGF5, Accession NP_149134.1), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5.

[18374] The function of FGF5 has been established by previous studies. Zhan et al. (1988) identified a fifth oncogene related to fibroblast growth factors and termed it FGF5. The other four are FGFA (OMIM Ref. No. 131220), FGFB (OMIM Ref. No. 134920), INT2 (OMIM Ref. No. 164950), and HST (OMIM Ref. No. 164980). FGF5 was discovered when it acquired transforming potential by a DNA rearrangement accompanying transfection of NIH 3T3 cells with human

tumor DNA. Two regions of the FGF5 sequence, containing 122 of its 267 amino acid residues, were 40 to 50% homologous to the sequences of the 4 other members of the FGF oncogene family. FGF5, furthermore, was found to have a 3- exon structure typical for members of this family. FGF5 was found to be expressed in neonatal brain and in 3 of 13 human tumor cell lines examined. Nguyen et al. (1988) mapped FGF5 to 4q21 by in situ hybridization. Thus, it is not in the same cluster as the related HST and INT2 genes, which are coamplified in some tumor cells and were found by Nguyen et al. (1988), using pulsed field gel analysis, to be separated by only 40 kb. By polymerase chain reaction (PCR) amplification of target sequences in DNAs from somatic cell hybrids, Dionne et al. (1990) mapped the FGF5 gene to chromosome 4. By in situ chromosomal hybridization, Mattei et al. (1992) demonstrated that the corresponding gene in the mouse is on chromosome 5. Hebert et al. (1994) found that mice homozygous for a null allele of the Fgf5 gene, produced by gene targeting in embryonic stem cells, have abnormally long hair. This phenotype appeared identical to that of mice homozygous for the spontaneous mutation 'angora' (go). The transgenic mutant and the 'go' mutant

failed to complement one another, and exon 1 of Fgf5 was found to be deleted in DNA from go homozygotes. Expression of Fgf5 is detected in hair follicles from wildtype mice and is localized to the outer root sheath during the anagen VI phase of the hair growth cycle. The findings were interpreted as evidence that FGF5 functions as an inhibitor of hair elongation, thus identifying a molecule whose normal function is apparently to regulate one step in the progression of the follicle through the hair growth cycle. It will be of interest to search for mutations in the FGF5 gene in hypertrichosis universalis (145700, 145701) as well as in other forms of hypertrichosis such as hairy elbows (OMIM Ref. No. 139600).

[18375]

[18376] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18377] Zhan, X.; Bates, B.; Hu, X.; Goldfarb, M. : The human FGF-5 oncogene encodes a novel protein related to fibroblast growth factors. Molec. Cell. Biol. 8: 3487- 3495, 1988. ; and

[18378] Hebert, J. M.; Rosenquist, T.; Gotz, J.; Martin, G. R. : FGF5 as a regulator of the hair growth cycle: evidence from tar-

geted and spontaneous mutations. Cell 78: 1017- 1025, 1994.

[18379] Further studies establishing the function and utilities of FGF5 are found in John Hopkins OMIM database record ID 165190, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fibroblast growth factor 5 (FGF5, Accession NP_004455.1) is another GAM106 target gene, herein designated TARGET GENE. FGF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FGF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18380] Another function of GAM106 is therefore inhibition of Fibroblast growth factor 5 (FGF5, Accession NP_004455.1), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5.

[18381] The function of FGF5 has been established by previous studies. Zhan et al. (1988) identified a fifth oncogene related to fibroblast growth factors and termed it FGF5. The other four are FGFA (OMIM Ref. No. 131220), FGFB (OMIM Ref. No. 134920), INT2 (OMIM Ref. No. 164950), and HST (OMIM Ref. No. 164980). FGF5 was discovered when it acquired transforming potential by a DNA rearrangement accompanying transfection of NIH 3T3 cells with human tumor DNA. Two regions of the FGF5 sequence, containing 122 of its 267 amino acid residues, were 40 to 50% homologous to the sequences of the 4 other members of the FGF oncogene family. FGF5, furthermore, was found to have a 3- exon structure typical for members of this family. FGF5 was found to be expressed in neonatal brain and in 3 of 13 human tumor cell lines examined. Nguyen et al. (1988) mapped FGF5 to 4q21 by in situ hybridization. Thus, it is not in the same cluster as the related HST and INT2 genes, which are coamplified in some tumor cells and were found by Nguyen et al. (1988), using pulsed field gel analysis, to be separated by only 40 kb. By polymerase chain reaction (PCR) amplification of target sequences in DNAs from somatic cell hybrids, Dionne et al. (1990) mapped the FGF5 gene to chromosome 4. By in

situ chromosomal hybridization, Mattei et al. (1992) demonstrated that the corresponding gene in the mouse is on chromosome 5. Hebert et al. (1994) found that mice homozygous for a null allele of the Fgf5 gene, produced by gene targeting in embryonic stem cells, have abnormally long hair. This phenotype appeared identical to that of mice homozygous for the spontaneous mutation 'angora' (go). The transgenic mutant and the 'go' mutant failed to complement one another, and exon 1 of Fgf5 was found to be deleted in DNA from go homozygotes. Expression of Fgf5 is detected in hair follicles from wildtype mice and is localized to the outer root sheath during the anagen VI phase of the hair growth cycle. The findings were interpreted as evidence that FGF5 functions as an inhibitor of hair elongation, thus identifying a molecule whose normal function is apparently to regulate one step in the progression of the follicle through the hair growth cycle. It will be of interest to search for mutations in the FGF5 gene in hypertrichosis universalis (145700, 145701) as well as in other forms of hypertrichosis such as hairy elbows (OMIM Ref. No. 139600).

[18382]

[18383] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[18386] Further studies establishing the function and utilities of FGF5 are found in John Hopkins OMIM database record ID 165190, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10613 (Accession NP_061940.1) is another GAM106 target gene, herein designated TARGET GENE. FLJ10613 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10613, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10613 BINDING SITE, designated SEQ ID:18157, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA,

also designated SEQ ID:231.

[18387] Another function of GAM106 is therefore inhibition of FLJ10613 (Accession NP_061940.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10613.

[18388] FLJ10815 (Accession NP_060701.1) is another GAM106 target gene, herein designated TARGET GENE. FLJ10815 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10815, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10815 BINDING SITE, designated SEQ ID:5821, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18389] Another function of GAM106 is therefore inhibition of FLJ10815 (Accession NP_060701.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10815.

[18390] FLJ20360 (Accession NP_060252.1) is another GAM106 target gene, herein designated TARGET GENE. FLJ20360

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20360, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20360 BINDING SITE, designated SEQ ID:9007, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18391] Another function of GAM106 is therefore inhibition of FLJ20360 (Accession NP_060252.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20360.

[18392] FLJ38716 (Accession NP_689580.1) is another GAM106 target gene, herein designated TARGET GENE. FLJ38716 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38716, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38716 BINDING SITE, designated SEQ ID:19701, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18393] Another function of GAM106 is therefore inhibition of FLJ38716 (Accession NP_689580.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38716.

[18394] Fms-related tyrosine kinase 3 (FLT3, Accession NP_004110.1) is another GAM106 target gene, herein designated TARGET GENE. FLT3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLT3 BINDING SITE, designated SEQ ID:20091, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18395] Another function of GAM106 is therefore inhibition of Fms-related tyrosine kinase 3 (FLT3, Accession NP_004110.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLT3.

[18396] Gap junction protein, alpha 4, 37kda (connexin 37) (GJA4, Accession NP_002051.1) is another GAM106 target gene,

herein designated TARGET GENE. GJA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GJA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GJA4 BINDING SITE, designated SEQ ID:17924, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18397] Another function of GAM106 is therefore inhibition of Gap junction protein, alpha 4, 37kda (connexin 37) (GJA4, Accession NP_002051.1), a gene which has a role in intercellular transport and communication. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA4.

[18398] The function of GJA4 has been established by previous studies. See 121011. Reed et al. (1993) used PCR amplification and cDNA library screening to clone DNA encoding the connexin 37 gap junction protein. The derived polypeptide contained 333 amino acids, with a predicted molecular mass of about 37 kD. RNA blots demonstrated that CX37 is expressed in multiple organs and tissues, in-

cluding heart, uterus, ovary, and blood vessel endothelium, and in primary cultures of vascular endothelial cells. Reed et al. (1993) demonstrated that CX37 can form functional cell- to- cell channels that have unique voltage-dependence and unitary conductance properties. Willecke et al. (1990) used a mouse cDNA probe in Southern analysis of human- mouse somatic cell hybrids to map the human CX37 gene to 1pter- q12. CX40 (OMIM Ref. No. 121013) was assigned to the same region of chromosome 1. Haefliger et al. (1992) showed that the homologs of CX37 and one other connexin gene are located on rat chromosome 4.

[18399]

[18400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18401] Haefliger, J.- A.; Bruzzone, R.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Paul, D. L. : Four novel members of the connexin family of gap junction proteins: molecular cloning, expression, and chromosome mapping. J. Biol. Chem. 267: 2057- 2064, 1992. ; and

[18402] Reed, K. E.; Westphale, E. M.; Larson, D. M.; Wang, H.- Z.; Veenstra, R. D.; Beyer, E. C. : Molecular cloning and func-

tional expression of human connexin37, an endothelial cell gap jun.

[18403] Further studies establishing the function and utilities of GJA4 are found in John Hopkins OMIM database record ID 121012, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gastrin-releasing peptide receptor (GRPR, Accession NP_005305.1) is another GAM106 target gene, herein designated TARGET GENE. GRPR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GRPR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRPR BINDING SITE, designated SEQ ID:10332, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18404] Another function of GAM106 is therefore inhibition of Gastrin-releasing peptide receptor (GRPR, Accession NP_005305.1), a gene which mediates its action by association with g proteins that activate a phosphatidylinositol- calcium second messenger system. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

GRPR.

[18405] The function of GRPR has been established by previous studies. Expression of gastrin- releasing polypeptide (GRP; 137260) and its receptor in tumors suggests that these molecules are part of an autocrine loop for growth. Spindel et al. (1990) cloned the human GRP receptor cDNA from a library made from a small cell lung carcinoma cell line using the mouse GRP receptor. The cDNA was in turn used to screen a human genomic library. Schantz et al. (1991) designed PCR primers that span the exon encoding amino acids 139 to 256 of the GRP receptor and used these for the analysis of somatic cell hybrids. In this way they found that the GRPR gene is located on the X chromosome. A panel of hybrids with translocations of the X chromosome permitted regionalization of the gene to Xp11- q11. Maslen and Boyd (1993) found that GRPR maps to Xp22.3- p21.2 rather than to the Xp11- q11 interval as previously reported. The assignment of GRPR to distal Xp was supported by the comparative map position in the mouse. The mapping in the human was done by means of PCR amplification from a panel of somatic cell hybrids that retained reduced portions of the X chromosome; the mapping in the mouse was done by linkage

studies in interspecific backcross matings. Shiraishi et al. (1996) noted that within the haploid genome there are approximately 1,000 copies of the human endogenous retrovirus- like sequence, HERV- H. Although these sequences are scattered throughout the genome, in situ hybridization experiments showed discrete clusters positioned on 1p and 7q. Shiraishi et al. (1996) located 3 HERV- H sequences that were unexpectedly clustered within a 300- kb region close to the GRPR locus on the X chromosome.

[18406]

[18407] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18408] Shiraishi, M.; Alitalo, T.; Sekiya, T. : The chromosomal organization of the human endogenous retrovirus- like sequence HERV- H: clustering of the HERV- H sequences in a 300- kb region close to the GRPR locus on the X chromosome. DNA Res. 3: 425- 429, 1996. ; and

[18409] Spindel, E. R.; Giladi, E.; Brehm, P.; Goodman, R. H.; Segerson, T. P. : Cloning and functional characterization of a complementary DNA encoding the murine fibroblast bombesin/gastrin- re.

[18410] Further studies establishing the function and utilities of GRPR are found in John Hopkins OMIM database record ID 305670, and in cited publications listed in Table 5, which are hereby incorporated by reference.Integrin, alpha 9 (ITGA9, Accession NP_002198.1) is another GAM106 target gene, herein designated TARGET GENE. ITGA9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITGA9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGA9 BINDING SITE, designated SEQ ID:4333, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18411] Another function of GAM106 is therefore inhibition of Integrin, alpha 9 (ITGA9, Accession NP_002198.1), a gene which recognizes the sequence a- e- i- d- g- i- e- l in cytotactin. and therefore may be associated with Lung cancer. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of Lung cancer, and of other diseases and clinical conditions associated with ITGA9.

[18412] The function of ITGA9 has been established by previous studies. The integrins are a large family of cell surface

glycoproteins that mediate cell- cell adhesion and cell-matrix adhesion. Integrins are heterodimers composed of an alpha and a beta subunit bound noncovalently to each other. Alpha integrins contain a large N- terminal extracellular domain with 7 conserved repeats of putative metal binding domains, a transmembrane segment, and a short C- terminal cytoplasmic tail. Some alpha integrins also contain an approximately 200- amino acid insertion (I) domain, and some undergo cleavage near the transmembrane domain. Integrin alpha- 4 (ITGA4; 192975) defines a distinct subfamily of alpha integrins because it is not cleaved and lacks an I domain. See 600536. Erle et al. (1991) isolated a partial cDNA encoding a novel alpha integrin, which they designated alpha- A, from guinea pig epithelial cells. By a combination of techniques, Palmer et al. (1993) isolated cDNAs encoding integrin alpha- 9, the human homolog of alpha- A. The predicted alpha- 9 protein contains 1,006 amino acids and is structurally similar to alpha- 4. Overall, the alpha- 4 and alpha- 9 proteins are 39% identical. Immunoprecipitation studies demonstrated that alpha- 9 forms an integrin heterodimer with beta- 1 (OMIM Ref. No. 135630). Using immunohistochemistry, Palmer et al. (1993) found that the alpha- 9

protein was expressed in human airway and in various mouse tissues, including airway epithelial cells, basal layers of squamous epithelium, smooth muscle, skeletal muscle, and hepatocytes. By analysis of a cloned segment from 3p22- p21.3, Daigo et al. (1999) determined that the integrin- alpha- RLC gene contains 28 exons and is located in this region. Yamakawa et al. (1993) identified a region of homozygous deletions on chromosome 3p21.3 in lung cancer cell lines. Hibi et al. (1994) determined that this region includes the ITGA9 gene, which they referred to as alpha- RLC (alpha related to the development of lung cancer). The predicted alpha- RLC protein contains 1,035 amino acids with a putative 29- amino acid N- terminal signal sequence. Northern blot analysis revealed that the alpha- RLC gene was expressed as 9.5- and 4.1-kb transcripts in all fetal tissues tested, and at lower levels in most adult tissues. Hibi et al. (1994) suggested that the 2 transcripts result from the use of alternative polyadenylation signals. Alpha- RLC expression was aberrantly upregulated in both cell lines and primary tumors of small cell lung cancer (SCLC; 182280), indicating that altered expression of alpha- RLC may contribute to the malignant phenotype of SCLC

[18413]

[18417] Further studies establishing the function and utilities of ITGA9 are found in John Hopkins OMIM database record ID 603963, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA1143 (Accession XP_044014.1) is another GAM106 target gene, herein designated TARGET GENE. KIAA1143 BINDING SITE is a target binding site found in the 3` untranslated re- gion of mRNA encoded by KIAA1143, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:2396, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18418] Another function of GAM106 is therefore inhibition of KIAA1143 (Accession XP_044014.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143.

[18419] KIAA1198 (Accession NP_065765.1) is another GAM106 target gene, herein designated TARGET GENE. KIAA1198 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:20133, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18420] Another function of GAM106 is therefore inhibition of KIAA1198 (Accession NP_065765.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1198.

[18421] KIAA1765 (Accession XP_047355.1) is another GAM106 target gene, herein designated TARGET GENE. KIAA1765 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1765, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1765 BINDING SITE, designated SEQ ID:18828, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18422] Another function of GAM106 is therefore inhibition of KIAA1765 (Accession XP_047355.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1765.

[18423] LOC145786 (Accession XP_096860.1) is another GAM106 target gene, herein designated TARGET GENE. LOC145786 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145786, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC145786 BINDING SITE, designated SEQ ID:823, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18424] Another function of GAM106 is therefore inhibition of LOC145786 (Accession XP_096860.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145786.

[18425] LOC146489 (Accession XP_047734.7) is another GAM106 target gene, herein designated TARGET GENE. LOC146489 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146489, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146489 BINDING SITE, designated SEQ ID:4016, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18426] Another function of GAM106 is therefore inhibition of LOC146489 (Accession XP_047734.7) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146489.

[18427] LOC146733 (Accession XP_097076.1) is another GAM106 target gene, herein designated TARGET GENE. LOC146733 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146733, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18428] Another function of GAM106 is therefore inhibition of LOC146733 (Accession XP_097076.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146733.

[18429] LOC154084 (Accession XP_098468.1) is another GAM106 target gene, herein designated TARGET GENE. LOC154084 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC154084, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC154084 BINDING SITE, designated SEQ ID:4793, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18430] Another function of GAM106 is therefore inhibition of LOC154084 (Accession XP_098468.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154084.

[18431] LOC165324 (Accession XP_092518.1) is another GAM106 target gene, herein designated TARGET GENE. LOC165324 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC165324, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC165324 BINDING SITE, designated SEQ ID:18910, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18432] Another function of GAM106 is therefore inhibition of LOC165324 (Accession XP_092518.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165324.

[18433] LOC283633 (Accession XP_208762.1) is another GAM106 target gene, herein designated TARGET GENE. LOC283633 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283633, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283633 BINDING SITE, designated SEQ ID:2396, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18434] Another function of GAM106 is therefore inhibition of LOC283633 (Accession XP_208762.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283633.

[18435] LOC284409 (Accession XP_211447.1) is another GAM106 target gene, herein designated TARGET GENE. LOC284409 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284409, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284409 BINDING SITE, designated SEQ ID:9942, to

the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18436] Another function of GAM106 is therefore inhibition of LOC284409 (Accession XP_211447.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284409.

[18437] LOC284997 (Accession XP_211723.1) is another GAM106 target gene, herein designated TARGET GENE. LOC284997 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284997, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284997 BINDING SITE, designated SEQ ID:12650, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18438] Another function of GAM106 is therefore inhibition of LOC284997 (Accession XP_211723.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284997.

[18439] LOC285153 (Accession XP_211786.1) is another GAM106

target gene, herein designated TARGET GENE. LOC285153 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285153, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285153 BINDING SITE, designated SEQ ID:3357, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18440] Another function of GAM106 is therefore inhibition of LOC285153 (Accession XP_211786.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285153.

[18441] LOC286356 (Accession XP_212290.1) is another GAM106 target gene, herein designated TARGET GENE. LOC286356 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286356, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286356 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:231.

[18442] Another function of GAM106 is therefore inhibition of LOC286356 (Accession XP_212290.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286356.

[18443] LOC286435 (Accession XP_210047.1) is another GAM106 target gene, herein designated TARGET GENE. LOC286435 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286435 BINDING SITE, designated SEQ ID:18372, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18444] Another function of GAM106 is therefore inhibition of LOC286435 (Accession XP_210047.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286435.

[18445] LOC339832 (Accession XP_295079.1) is another GAM106 target gene, herein designated TARGET GENE. LOC339832

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339832, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339832 BINDING SITE, designated SEQ ID:13768, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18446] Another function of GAM106 is therefore inhibition of LOC339832 (Accession XP_295079.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339832.

[18447] LOC339865 (Accession XP_295089.1) is another GAM106 target gene, herein designated TARGET GENE. LOC339865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339865 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18448] Another function of GAM106 is therefore inhibition of LOC339865 (Accession XP_295089.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339865.

[18449] LOC348264 (Accession XP_302706.1) is another GAM106 target gene, herein designated TARGET GENE. LOC348264 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348264, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348264 BINDING SITE, designated SEQ ID:13642, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18450] Another function of GAM106 is therefore inhibition of LOC348264 (Accession XP_302706.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348264.

[18451] LOC348265 (Accession XP_302705.1) is another GAM106 target gene, herein designated TARGET GENE. LOC348265 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC348265, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348265 BINDING SITE, designated SEQ ID:13642, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18452] Another function of GAM106 is therefore inhibition of LOC348265 (Accession XP_302705.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348265.

[18453] LOC348721 (Accession XP_300822.1) is another GAM106 target gene, herein designated TARGET GENE. LOC348721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348721 BINDING SITE, designated SEQ ID:1854, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18454] Another function of GAM106 is therefore inhibition of

LOC348721 (Accession XP_300822.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348721.

[18455] LOC349430 (Accession XP_301084.1) is another GAM106 target gene, herein designated TARGET GENE. LOC349430 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349430, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349430 BINDING SITE, designated SEQ ID:18372, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18456] Another function of GAM106 is therefore inhibition of LOC349430 (Accession XP_301084.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349430.

[18457] LOC349432 (Accession XP_301086.1) is another GAM106 target gene, herein designated TARGET GENE. LOC349432 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349432, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349432 BINDING SITE, designated SEQ ID:18372, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18458] Another function of GAM106 is therefore inhibition of LOC349432 (Accession XP_301086.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349432.

[18459] LOC57086 (Accession NP_065084.1) is another GAM106 target gene, herein designated TARGET GENE. LOC57086 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57086, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57086 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18460] Another function of GAM106 is therefore inhibition of LOC57086 (Accession NP_065084.1) . Accordingly, utili-

ties of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57086.

[18461] Leucine zipper and ctnnbip1 domain containing (LZIC, Accession NP_115744.2) is another GAM106 target gene, herein designated TARGET GENE. LZIC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LZIC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LZIC BINDING SITE, designated SEQ ID:14665, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18462] Another function of GAM106 is therefore inhibition of Leucine zipper and ctnnbip1 domain containing (LZIC, Accession NP_115744.2) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZIC.

[18463] Mitogen-activated protein kinase kinase kinase 7 interacting protein 2 (MAP3K7IP2, Accession NP_663317.1) is another GAM106 target gene, herein designated TARGET GENE. MAP3K7IP2 BINDING SITE is a target binding site

found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAP3K7IP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K7IP2 BINDING SITE, designated SEQ ID:17213, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18464] Another function of GAM106 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 7 interacting protein 2 (MAP3K7IP2, Accession NP_663317.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP2.

[18465] Mitogen-activated protein kinase kinase kinase 7 interacting protein 2 (MAP3K7IP2, Accession NP_055908.1) is another GAM106 target gene, herein designated TARGET GENE. MAP3K7IP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAP3K7IP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K7IP2

BINDING SITE, designated SEQ ID:17213, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18466] Another function of GAM106 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 7 interacting protein 2 (MAP3K7IP2, Accession NP_055908.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP2.

[18467] MGC11386 (Accession NP_116322.1) is another GAM106 target gene, herein designated TARGET GENE. MGC11386 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11386, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11386 BINDING SITE, designated SEQ ID:5748, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18468] Another function of GAM106 is therefore inhibition of MGC11386 (Accession NP_116322.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC11386.

[18469] MGC27005 (Accession NP_689795.2) is another GAM106 target gene, herein designated TARGET GENE. MGC27005 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC27005, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC27005 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18470] Another function of GAM106 is therefore inhibition of MGC27005 (Accession NP_689795.2) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27005.

[18471] Machado-joseph disease (spinocerebellar ataxia 3, olivopontocerebellar ataxia 3, autosomal dominant, ataxin 3) (MJD, Accession NP_004984.2) is another GAM106 target gene, herein designated TARGET GENE. MJD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MJD, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MJD BINDING SITE, designated SEQ ID:18203, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18472] Another function of GAM106 is therefore inhibition of Machado-joseph disease (spinocerebellar ataxia 3, olivopontocerebellar ataxia 3, autosomal dominant, ataxin 3) (MJD, Accession NP_004984.2) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MJD.

[18473] Machado-joseph disease (spinocerebellar ataxia 3, olivopontocerebellar ataxia 3, autosomal dominant, ataxin 3) (MJD, Accession NP_109376.1) is another GAM106 target gene, herein designated TARGET GENE. MJD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MJD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MJD BINDING SITE, designated SEQ ID:18203, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18474] Another function of GAM106 is therefore inhibition of Machado-joseph disease (spinocerebellar ataxia 3, olivo-pontocerebellar ataxia 3, autosomal dominant, ataxin 3) (MJD, Accession NP_109376.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MJD.

[18475] Oligophrenin 1 (OPHN1, Accession NP_002538.1) is another GAM106 target gene, herein designated TARGET GENE. OPHN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OPHN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18476] Another function of GAM106 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NP_002538.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1.

[18477] Phosphodiesterase 10a (PDE10A, Accession NP_006652.1)

is another GAM106 target gene, herein designated TARGET GENE. PDE10A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE10A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:13919, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18478] Another function of GAM106 is therefore inhibition of Phosphodiesterase 10a (PDE10A, Accession NP_006652.1). Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE10A.

[18479] Phosphorylase kinase, alpha 1 (muscle) (PHKA1, Accession NP_002628.1) is another GAM106 target gene, herein designated TARGET GENE. PHKA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PHKA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHKA1 BINDING SITE, designated

SEQ ID:9297, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18480] Another function of GAM106 is therefore inhibition of Phosphorylase kinase, alpha 1 (muscle) (PHKA1, Accession NP_002628.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHKA1.

[18481] Prostaglandin-endoperoxide synthase 2 (prostaglandin g/h synthase and cyclooxygenase) (PTGS2, Accession NP_000954.1) is another GAM106 target gene, herein designated TARGET GENE. PTGS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS2 BINDING SITE, designated SEQ ID:10976, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18482] Another function of GAM106 is therefore inhibition of Prostaglandin-endoperoxide synthase 2 (prostaglandin g/h synthase and cyclooxygenase) (PTGS2, Accession NP_000954.1), a gene which may have a role as a major

mediator of inflammation and/or a role for prostanoid signaling in activity- dependent plasticity. and therefore may be associated with Inflammatory diseases such as rheumatoid arthritis. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of Inflammatory diseases such as rheumatoid arthritis., and of other diseases and clinical conditions associated with PTGS2.

[18483] The function of PTGS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM100.1.Rab3a interacting protein (rabin3) (RAB3IP, Accession NP_071901.2) is another GAM106 target gene, herein designated TARGET GENE. RAB3IP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB3IP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB3IP BINDING SITE, designated SEQ ID:13725, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18484] Another function of GAM106 is therefore inhibition of Rab3a interacting protein (rabin3) (RAB3IP, Accession

NP_071901.2) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IP.

[18485] RASGRP3 (Accession NP_733772.1) is another GAM106 target gene, herein designated TARGET GENE. RASGRP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASGRP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP3 BINDING SITE, designated SEQ ID:9577, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18486] Another function of GAM106 is therefore inhibition of RASGRP3 (Accession NP_733772.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP3.

[18487] RETNLB (Accession NP_115968.1) is another GAM106 target gene, herein designated TARGET GENE. RETNLB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RETNLB, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RETNLB BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18488] Another function of GAM106 is therefore inhibition of RETNLB (Accession NP_115968.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RETNLB.

[18489] Rhomboid, veinlet-like 1 (drosophila) (RHBDL, Accession NP_003952.1) is another GAM106 target gene, herein designated TARGET GENE. RHBDL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RHBDL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RHBDL BINDING SITE, designated SEQ ID:4596, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18490] Another function of GAM106 is therefore inhibition of Rhomboid, veinlet-like 1 (drosophila) (RHBDL, Accession NP_003952.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RHBDL.

[18491] Ring finger protein 32 (RNF32, Accession NP_112198.1) is another GAM106 target gene, herein designated TARGET GENE. RNF32 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF32, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF32 BINDING SITE, designated SEQ ID:14433, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18492] Another function of GAM106 is therefore inhibition of Ring finger protein 32 (RNF32, Accession NP_112198.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF32.

[18493] S100 calcium binding protein, beta (neural) (S100B, Accession NP_006263.1) is another GAM106 target gene, herein designated TARGET GENE. S100B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:14463, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18494] Another function of GAM106 is therefore inhibition of S100 calcium binding protein, beta (neural) (S100B, Accession NP_006263.1), a gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B.

[18495] The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM49.1.STAF42 (Accession NP_444281.1) is another GAM106 target gene, herein designated TARGET GENE. STAF42 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STAF42, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAF42 BINDING SITE, designated SEQ ID:565, to the

nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18496] Another function of GAM106 is therefore inhibition of STAF42 (Accession NP_444281.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF42.

[18497] Syntaxin 7 (STX7, Accession NP_003560.1) is another GAM106 target gene, herein designated TARGET GENE. STX7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STX7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STX7 BINDING SITE, designated SEQ ID:10787, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18498] Another function of GAM106 is therefore inhibition of Syntaxin 7 (STX7, Accession NP_003560.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX7.

[18499] Surfeit 5 (SURF5, Accession NP_852468.1) is another GAM106 target gene, herein designated TARGET GENE.

SURF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SURF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SURF5 BINDING SITE, designated SEQ ID:6232, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18500] Another function of GAM106 is therefore inhibition of Surfeit 5 (SURF5, Accession NP_852468.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF5.

[18501] Tbc1 domain family, member 2 (TBC1D2, Accession NP_060891.1) is another GAM106 target gene, herein designated TARGET GENE. TBC1D2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TBC1D2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBC1D2 BINDING SITE, designated SEQ ID:4122, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:231.

[18502] Another function of GAM106 is therefore inhibition of Tbc1 domain family, member 2 (TBC1D2, Accession NP_060891.1) . Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBC1D2.

[18503] Tolloid-like 1 (TLL1, Accession NP_036596.3) is another GAM106 target gene, herein designated TARGET GENE. TLL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TLL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TLL1 BINDING SITE, designated SEQ ID:5091, to the nucleotide sequence of GAM106 RNA, herein designated GAM RNA, also designated SEQ ID:231.

[18504] Another function of GAM106 is therefore inhibition of Tolloid-like 1 (TLL1, Accession NP_036596.3), a gene which is involved in bone morphogenesis. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLL1.

[18505] The function of TLL1 has been established by previous

studies. Scott et al. (1999) compared enzymatic activities and expression domains of 4 mammalian BMP1/TLD- like proteases and found differences in their ability to process fibrillar collagen precursors and to cleave chordin (OMIM Ref. No. 603475). As previously demonstrated for BMP1 and TLD, TLL1 specifically processes procollagen C-propeptides at the physiologically relevant site, whereas TLL2 (OMIM Ref. No. 606743) lacks this activity. BMP1 and TLL1 cleave chordin, at sites similar to procollagen C-propeptide cleavage sites, and counteract dorsalizing effects of chordin upon overexpression on Xenopus embryos. Proteases TLD and TLL2 do not cleave chordin.

[18506] Animal model experiments lend further support to the function of TLL1. Clark et al. (1999) used gene targeting in embryonic stem cells to produce mice with a disrupted allele for Tll1. Homozygous mutants were embryonic lethal, with death at midgestation from cardiac failure and a constellation of developmental defects confined to the heart. Constant features were incomplete formation of the muscular interventricular septum and an abnormal and novel positioning of the heart and aorta.

[18507] It is appreciated that the abovementioned animal model for TLL1 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[18508] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18509] Scott, I. C.; Blitz, I. L.; Pappano, W. N.; Imamura, Y.; Clark, T. G.; Steiglitz, B. M.; Thomas, C. L.; Maas, S. A.; Takahara, K.; Cho, K. W. Y.; Greenspan, D. S. : Mammalian BMP-1/tolloid- related metalloproteinases, including novel family member mammalian tolloid- like 2, have differential enzymatic activities and distributions of expression relevant to patterning and skeletogenesis. Dev. Biol. 213: 283- 300, 1999. ; and

[18510] Clark, T. G.; Conway, S. J.; Scott, I. C.; Labosky, P. A.; Winnier, G.; Bundy, J.; Hogan, B. L. M.; Greenspan, D. S. : The mammalian Tolloid- like 1 gene, Tll1, is necessary for normal s.

[18511] Further studies establishing the function and utilities of TLL1 are found in John Hopkins OMIM database record ID 606742, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[18512] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 107 (GAM107), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18513] GAM107 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM107 was detected is described hereinabove with reference to Figs. 8-15.

[18514] GAM107 gene, herein designated GAM GENE, and GAM107 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18515] GAM107 gene encodes a GAM107 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM107 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM107 precursor RNA is designated SEQ ID:79, and is provided hereinbelow with reference to the sequence listing part.

[18516] GAM107 precursor RNA folds onto itself, forming GAM107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18517] GAM107 precursor RNA folds onto itself, forming GAM107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18518] Nucleotide sequence of GAM107 precursor RNA, designated SEQ-ID: 79, and a schematic representation of a predicted secondary folding of GAM107 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18519] An enzyme complex designated DICER COMPLEX, `dices` the GAM107 folded precursor RNA into GAM107 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM107 RNA is designated SEQ ID:341, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18520] GAM107 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM107 target RNA, herein designated GAM TARGET RNA. GAM107 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18521] GAM107 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM107 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM107 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such

target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM107 RNA may have a different number of target binding sites in untranslated regions of a GAM107 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18522] The complementary binding of GAM107 RNA, herein designated GAM RNA, to target binding sites on GAM107 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM107 target RNA into GAM107 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18523] It is appreciated that GAM107 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM107 target genes. The mRNA of each one of this plurality of GAM107 target genes comprises one or more target binding sites, each having a nucleotide sequence

which is at least partly complementary to GAM107 RNA, herein designated GAM RNA, and which when bound by GAM107 RNA causes inhibition of translation of respective one or more GAM107 target proteins.

[18524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM107 gene, herein designated GAM GENE, on one or more GAM107 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18525] It is appreciated that specific functions and accordingly utilities of GAM107 correlate with, and may be deduced from, the identity of the target genes which GAM107

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18526]

[18527]

[18528] Butyrophilin, subfamily 2, member a2 (BTN2A2, Accession NM_006995.2) is a GAM107 target gene, herein designated TARGET GENE. BTN2A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BTN2A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTN2A2 BINDING SITE, designated SEQ ID:19308, to the nucleotide sequence of GAM107 RNA, herein designated GAM RNA, also designated SEQ ID:341.

[18529] A function of GAM107 is therefore inhibition of Butyrophilin, subfamily 2, member a2 (BTN2A2, Accession NM_006995.2) . Accordingly, utilities of GAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A2.

[18530] Distal-less homeobox 4 (DLX4, Accession NM_138281.1) is another GAM107 target gene, herein designated TAR-

GET GENE. DLX4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DLX4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DLX4 BINDING SITE, designated SEQ ID:489, to the nucleotide sequence of GAM107 RNA, herein designated GAM RNA, also designated SEQ ID:341.

[18531] Another function of GAM107 is therefore inhibition of Distal-less homeobox 4 (DLX4, Accession NM_138281.1), a gene which may regulate gene expression, morphogenesis, and differentiation. Accordingly, utilities of GAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLX4.

[18532] The function of DLX4 has been established by previous studies. Using degenerate PCR, Nakamura et al. (1996) cloned a gene, which they referred to as DLX7, from human and mouse that may represent the mammalian ortholog of the newt gene NuHBox- 5. They isolated a human cDNA predicting a 167- amino acid protein. The homeodomains of these genes are highly similar to those of all other vertebrate DLX genes, but there is divergence

upstream of the homeodomain between the human and mouse DLX7 genes and between DLX7 and other DLX genes. They presented evidence that the mouse Dlx7 gene is alternatively spliced. By Northern blot analysis, Nakamura et al. (1996) found that DLX7 is expressed as a 2.3-kb transcript in several human cell lines. By fluorescence in situ hybridization (FISH), Nakamura et al. (1996) mapped DLX7 to 17q21.3- q22. They stated that the human DLX7 and DLX3 (OMIM Ref. No. 600525) genes are 10 kb apart and are arranged in a tail- to- tail tandem orientation, similarly to that found in mouse. Using dual-color FISH, Nakamura et al. (1996) determined that human DLX7 and HOX9B (OMIM Ref. No. 142964) lie within 2 Mb of one another. Quinn et al. (1997) undertook a DNA binding site screen of a 32- week human placental cDNA library using a consensus homeodomain binding site as a probe. They claimed that this study represented the first library screen carried out to isolate homeo box genes from the human placenta. They found that 3 homeo box genes known to be expressed in embryo, HB24 (OMIM Ref. No. 142995), GAX (OMIM Ref. No. 600535), and MSX2 (OMIM Ref. No. 123101), are also expressed in the placenta. They also identified a novel homeo box gene, des-

ignated DLX4 by them, that showed 85% sequence identity with the homeodomain encoded by the Drosophila 'distal-less' gene. Using FISH, they assigned DLX4 to 17q21-q22. This placed DLX4 in the same region of chromosome 17 as a member of the distal- less family gene DLX3 (OMIM Ref. No. 600525) and the HOXB homeo box gene cluster (see OMIM Ref. No. HOXB1; 142968). DLX1 (OMIM Ref. No. 600029) and DLX2 (OMIM Ref. No. 126255) are closely linked on chromosome 2; DLX5 (OMIM Ref. No. 600028) and DLX6 (OMIM Ref. No. 600030) are closely linked on chromosome 7. Thus, Quinn et al. (1997) predicted that DLX3 and DLX4 are closely linked and that they arose through gene duplication and divergence from a common ancestral precursor.

[18533]

[18534] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18535] Morasso, M. I.; Yonescu, R.; Griffin, C. A.; Sargent, T. D. : Localization of human DLX8 to chromosome 17q21.3-q22 by fluorescence in situ hybridization. Mammalian Genome 8: 302- 303, 1997. ; and

[18536] Nakamura, S.; Stock, D. W.; Wydner, K. L.; Bollekens, J. A.;

Takeshita, K.; Nagai, B. M.; Chiba, S.; Kitamura, T.; Freeland, T. M.; Zhao, Z.; Minowada, J.; Lawrence, J. B.; Weiss, K. M.

[18537] Further studies establishing the function and utilities of DLX4 are found in John Hopkins OMIM database record ID 601911, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC127534 (Accession) is another GAM107 target gene, herein designated TARGET GENE. LOC127534 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC127534, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:8266, to the nucleotide sequence of GAM107 RNA, herein designated GAM RNA, also designated SEQ ID:341.

[18538] Another function of GAM107 is therefore inhibition of LOC127534 (Accession) . Accordingly, utilities of GAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534.

[18539]

[18540] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 108 (GAM108), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18541] GAM108 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM108 was detected is described hereinabove with reference to Figs. 8-15.

[18542] GAM108 gene, herein designated GAM GENE, and GAM108 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18543] GAM108 gene encodes a GAM108 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM108 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM108 precursor RNA is designated SEQ ID:171, and is provided hereinbelow with reference to the sequence listing part.

[18544] GAM108 precursor RNA folds onto itself, forming GAM108 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18545] GAM108 precursor RNA folds onto itself, forming GAM108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18546] Nucleotide sequence of GAM108 precursor RNA, designated SEQ-ID: 171, and a schematic representation of a predicted secondary folding of GAM108 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18547] An enzyme complex designated DICER COMPLEX, `dices` the GAM108 folded precursor RNA into GAM108 RNA,

herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM108 RNA is designated SEQ ID:298, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18548] GAM108 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM108 target RNA, herein designated GAM TARGET RNA. GAM108 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18549] GAM108 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM108 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM108 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM108 RNA may have a different number of target binding sites in untranslated regions of a GAM108 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18550] The complementary binding of GAM108 RNA, herein designated GAM RNA, to target binding sites on GAM108 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM108 target RNA into GAM108 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18551] It is appreciated that GAM108 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM108 target genes. The mRNA of each one of this plu-

rality of GAM108 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM108 RNA, herein designated GAM RNA, and which when bound by GAM108 RNA causes inhibition of translation of respective one or more GAM108 target proteins.

[18552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM108 gene, herein designated GAM GENE, on one or more GAM108 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18553] It is appreciated that specific functions and accordingly

utilities of GAM108 correlate with, and may be deduced from, the identity of the target genes which GAM108 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18554]

[18555]

[18556] FLJ21276 (Accession) is a GAM108 target gene, herein designated TARGET GENE. FLJ21276 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:532, to the nucleotide sequence of GAM108 RNA, herein designated GAM RNA, also designated SEQ ID:298.

[18557] A function of GAM108 is therefore inhibition of FLJ21276 (Accession) . Accordingly, utilities of GAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276.

[18558] Forkhead box e1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473.3) is another GAM108 target gene,

herein designated TARGET GENE. FOXE1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOXE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXE1 BINDING SITE, designated SEQ ID:9989, to the nucleotide sequence of GAM108 RNA, herein designated GAM RNA, also designated SEQ ID:298.

[18559] Another function of GAM108 is therefore inhibition of Forkhead box e1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473.3) . Accordingly, utilities of GAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE1.

[18560] Protein kinase (camp-dependent, catalytic) inhibitor gamma (PKIG, Accession NM_007066.2) is another GAM108 target gene, herein designated TARGET GENE. PKIG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKIG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKIG BINDING SITE, designated SEQ ID:15790, to the nu-

cleotide sequence of GAM108 RNA, herein designated GAM RNA, also designated SEQ ID:298.

[18561] Another function of GAM108 is therefore inhibition of Protein kinase (camp-dependent, catalytic) inhibitor gamma (PKIG, Accession NM_007066.2) . Accordingly, utilities of GAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIG.

[18562]

[18563] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 109 (GAM109), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18564] GAM109 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM109 was detected is described hereinabove with reference to Figs. 8-15.

[18565] GAM109 gene, herein designated GAM GENE, and GAM109 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18566] GAM109 gene encodes a GAM109 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM109 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM109 precursor RNA is designated SEQ ID:90, and is provided hereinbelow with reference to the sequence listing part.

[18567] GAM109 precursor RNA folds onto itself, forming GAM109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18568] GAM109 precursor RNA folds onto itself, forming GAM109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18569] Nucleotide sequence of GAM109 precursor RNA, designated SEQ-ID: 90, and a schematic representation of a predicted secondary folding of GAM109 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18570] An enzyme complex designated DICER COMPLEX, `dices` the GAM109 folded precursor RNA into GAM109 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM109 RNA is designated SEQ ID:290, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18571] GAM109 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM109 target RNA, herein designated GAM TARGET RNA. GAM109 target RNA comprises three regions, as is typical of mRNA of

a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18572] GAM109 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM109 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM109 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM109 RNA may have a different number of target binding sites in untranslated regions of a GAM109 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18573] The complementary binding of GAM109 RNA, herein des-

ignated GAM RNA, to target binding sites on GAM109 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM109 target RNA into GAM109 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18574] It is appreciated that GAM109 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM109 target genes. The mRNA of each one of this plurality of GAM109 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM109 RNA, herein designated GAM RNA, and which when bound by GAM109 RNA causes inhibition of translation of respective one or more GAM109 target proteins.

[18575] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM109 gene, herein designated GAM GENE, on one or more GAM109 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18576] It is appreciated that specific functions and accordingly utilities of GAM109 correlate with, and may be deduced from, the identity of the target genes which GAM109 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18577]

[18578]

[18579] A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NM_001110.1) is a GAM109 target gene, herein designated TARGET GENE. ADAM10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of ADAM10 BINDING SITE, designated SEQ ID:14240, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18580] A function of GAM109 is therefore inhibition of A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NM_001110.1), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM10.

[18581] The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Atpase, h+ transporting, lysosomal 21kda, v0 subunit c" (ATP6V0B, Accession NM_004047.2) is another GAM109 target gene, herein designated TARGET GENE. ATP6V0B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP6V0B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V0B BINDING SITE, designated SEQ ID:18127, to the nucleotide sequence of GAM109 RNA,

herein designated GAM RNA, also designated SEQ ID:290.

[18582] Another function of GAM109 is therefore inhibition of At-pase, h+ transporting, lysosomal 21kda, v0 subunit c" (ATP6V0B, Accession NM_004047.2) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V0B.

[18583] BMF (Accession NM_033503.2) is another GAM109 target gene, herein designated TARGET GENE. BMF BINDING SITE is a target binding site found in the 3` untranslated re-gion of mRNA encoded by BMF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-mentarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:13824, to the nucleotide se-quence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18584] Another function of GAM109 is therefore inhibition of BMF (Accession NM_033503.2) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF.

[18585] BOP (Accession XM_097915.2) is another GAM109 target gene, herein designated TARGET GENE. BOP BINDING SITE

is a target binding site found in the 5` untranslated region of mRNA encoded by BOP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:6290, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18586] Another function of GAM109 is therefore inhibition of BOP (Accession XM_097915.2) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP.

[18587] Chromosome 20 open reading frame 124 (C20orf124, Accession XM_300247.1) is another GAM109 target gene, herein designated TARGET GENE. C20orf124 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf124, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf124 BINDING SITE, designated SEQ ID:14412, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18588] Another function of GAM109 is therefore inhibition of Chromosome 20 open reading frame 124 (C20orf124, Accession XM_300247.1) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf124.

[18589] Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NM_175864.1) is another GAM109 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:2361, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18590] Another function of GAM109 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NM_175864.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CBFA2T2.

[18591] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.FLJ21709 (Accession) is another GAM109 target gene, herein designated TARGET GENE. FLJ21709 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21709, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:15800, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18592] Another function of GAM109 is therefore inhibition of FLJ21709 (Accession) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709.

[18593] KIAA1110 (Accession) is another GAM109 target gene, herein designated TARGET GENE. KIAA1110 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1110, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:12180, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18594] Another function of GAM109 is therefore inhibition of KIAA1110 (Accession) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1110.

[18595] KIAA1466 (Accession XM_050285.2) is another GAM109 target gene, herein designated TARGET GENE. KIAA1466 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1466 BINDING SITE, designated SEQ ID:15690, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18596] Another function of GAM109 is therefore inhibition of KIAA1466 (Accession XM_050285.2) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1466.

[18597] KIAA1879 (Accession XM_056635.4) is another GAM109 target gene, herein designated TARGET GENE. KIAA1879 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1879, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:5187, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18598] Another function of GAM109 is therefore inhibition of KIAA1879 (Accession XM_056635.4) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879.

[18599] LOC131873 (Accession XM_067585.7) is another GAM109 target gene, herein designated TARGET GENE. LOC131873 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC131873, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC131873 BINDING SITE, designated SEQ ID:14590, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18600] Another function of GAM109 is therefore inhibition of LOC131873 (Accession XM_067585.7) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873.

[18601] LOC203297 (Accession) is another GAM109 target gene, herein designated TARGET GENE. LOC203297 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC203297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203297 BINDING SITE, designated SEQ ID:2084, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18602] Another function of GAM109 is therefore inhibition of LOC203297 (Accession) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203297.

[18603] LOC221922 (Accession XM_166555.1) is another GAM109 target gene, herein designated TARGET GENE. LOC221922 BINDING SITE1 and LOC221922 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC221922, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE1 and LOC221922 BINDING SITE2, designated SEQ ID:15720 and SEQ ID:4591 respectively, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18604] Another function of GAM109 is therefore inhibition of LOC221922 (Accession XM_166555.1) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922.

[18605] LOC91266 (Accession XM_037268.7) is another GAM109 target gene, herein designated TARGET GENE. LOC91266 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:4492, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18606] Another function of GAM109 is therefore inhibition of LOC91266 (Accession XM_037268.7) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91266.

[18607] Transmembrane, prostate androgen induced rna (TMEPAI, Accession NM_020182.2) is another GAM109 target gene, herein designated TARGET GENE. TMEPAI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMEPAI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:1160, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18608] Another function of GAM109 is therefore inhibition of Transmembrane, prostate androgen induced rna (TMEPAI, Accession NM_020182.2) . Accordingly, utilities of

GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI.

[18609] VEZATIN (Accession NM_017599.2) is another GAM109 target gene, herein designated TARGET GENE. VEZATIN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VEZATIN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VEZATIN BINDING SITE, designated SEQ ID:3317, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18610] Another function of GAM109 is therefore inhibition of VEZATIN (Accession NM_017599.2) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN.

[18611] ZFP106 (Accession NM_022473.1) is another GAM109 target gene, herein designated TARGET GENE. ZFP106 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFP106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:11274, to the nucleotide sequence of GAM109 RNA, herein designated GAM RNA, also designated SEQ ID:290.

[18612] Another function of GAM109 is therefore inhibition of ZFP106 (Accession NM_022473.1) . Accordingly, utilities of GAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106.

[18613]

[18614] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 110 (GAM110), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18615] GAM110 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM110 was detected is described hereinabove with reference to Figs. 8-15.

[18616] GAM110 gene, herein designated GAM GENE, and GAM110 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18617] GAM110 gene encodes a GAM110 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM110 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM110 precursor RNA is designated SEQ ID:115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:115 is located at position 6152245 relative to chromosome 19.

[18618] GAM110 precursor RNA folds onto itself, forming GAM110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18619] GAM110 precursor RNA folds onto itself, forming GAM110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18620] Nucleotide sequence of GAM110 precursor RNA, designated SEQ-ID: 115, and a schematic representation of a predicted secondary folding of GAM110 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18621] An enzyme complex designated DICER COMPLEX, `dices` the GAM110 folded precursor RNA into GAM110 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM110 RNA is designated SEQ ID:375, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18622] GAM110 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM110 target

RNA, herein designated GAM TARGET RNA. GAM110 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18623] GAM110 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM110 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM110 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM110 RNA may have a different number of target binding sites in untranslated regions of a GAM110 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[18624] The complementary binding of GAM110 RNA, herein designated GAM RNA, to target binding sites on GAM110 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM110 target RNA into GAM110 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18625] It is appreciated that GAM110 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM110 target genes. The mRNA of each one of this plurality of GAM110 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM110 RNA, herein designated GAM RNA, and which when bound by GAM110 RNA causes inhibition of translation of respective one or more GAM110 target proteins.

[18626] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM110 gene, herein designated GAM GENE, on one or more GAM110 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes.

As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18627] It is appreciated that specific functions and accordingly utilities of GAM110 correlate with, and may be deduced from, the identity of the target genes which GAM110 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18628]

[18629]

[18630] LOC147670 (Accession XM_097265.6) is a GAM110 target gene, herein designated TARGET GENE. LOC147670 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147670, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147670 BINDING SITE, designated SEQ ID:10171, to the nucleotide sequence of GAM110 RNA, herein designated GAM RNA, also designated SEQ ID:375.

[18631] A function of GAM110 is therefore inhibition of LOC147670 (Accession XM_097265.6) . Accordingly, utilities of GAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147670.

[18632]

[18633] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 111 (GAM111), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18634] GAM111 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM111 was detected is described hereinabove with reference to Figs. 8-15.

[18635] GAM111 gene, herein designated GAM GENE, and GAM111 target gene, herein designated TARGET GENE,

are human genes contained in the human genome.

[18636] GAM111 gene encodes a GAM111 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM111 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM111 precursor RNA is designated SEQ ID:3, and is provided hereinbelow with reference to the sequence listing part.

[18637] GAM111 precursor RNA folds onto itself, forming GAM111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18638] GAM111 precursor RNA folds onto itself, forming GAM111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18639] Nucleotide sequence of GAM111 precursor RNA, designated SEQ-ID: 3, and a schematic representation of a predicted secondary folding of GAM111 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18640] An enzyme complex designated DICER COMPLEX, `dices` the GAM111 folded precursor RNA into GAM111 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM111 RNA is designated SEQ ID:311, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18641] GAM111 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM111 target

RNA, herein designated GAM TARGET RNA. GAM111 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18642] GAM111 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM111 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM111 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM111 RNA may have a different number of target binding sites in untranslated regions of a GAM111 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[18643] The complementary binding of GAM111 RNA, herein designated GAM RNA, to target binding sites on GAM111 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM111 target RNA into GAM111 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18644] It is appreciated that GAM111 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM111 target genes. The mRNA of each one of this plurality of GAM111 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM111 RNA, herein designated GAM RNA, and which when bound by GAM111 RNA causes inhibition of translation of respective one or more GAM111 target proteins.

[18645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM111 gene, herein designated GAM GENE, on one or more GAM111 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes.

As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18646] It is appreciated that specific functions and accordingly utilities of GAM111 correlate with, and may be deduced from, the identity of the target genes which GAM111 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18647]

[18648]

[18649] HA-1 (Accession XM_037574.3) is a GAM111 target gene, herein designated TARGET GENE. HA-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HA-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HA-1 BINDING SITE, designated SEQ ID:8389, to the nucleotide sequence of GAM111 RNA, herein designated GAM RNA, also designated SEQ ID:311.

[18650] A function of GAM111 is therefore inhibition of HA-1 (Accession XM_037574.3) . Accordingly, utilities of GAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HA-1.

[18651] LOC219513 (Accession) is another GAM111 target gene, herein designated TARGET GENE. LOC219513 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219513, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:3411, to the nucleotide sequence of GAM111 RNA, herein designated GAM RNA, also designated SEQ ID:311.

[18652] Another function of GAM111 is therefore inhibition of LOC219513 (Accession) . Accordingly, utilities of GAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219513.

[18653] LOC257442 (Accession) is another GAM111 target gene, herein designated TARGET GENE. LOC257442 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257442 BINDING SITE, designated SEQ ID:6598, to the nucleotide sequence of GAM111 RNA, herein designated GAM RNA, also designated SEQ ID:311.

[18654] Another function of GAM111 is therefore inhibition of LOC257442 (Accession) . Accordingly, utilities of GAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257442.

[18655] LOC91947 (Accession XM_041721.3) is another GAM111 target gene, herein designated TARGET GENE. LOC91947 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91947, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC91947 BINDING SITE, designated SEQ ID:14120, to the nucleotide sequence of GAM111 RNA, herein designated GAM RNA, also designated SEQ ID:311.

[18656] Another function of GAM111 is therefore inhibition of LOC91947 (Accession XM_041721.3) . Accordingly, utilities of GAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91947.

[18657] Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession NM_004668.1) is another GAM111 target gene, herein designated TARGET GENE. MGAM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGAM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGAM BINDING SITE, designated SEQ ID:11018, to the nucleotide sequence of GAM111 RNA, herein designated GAM RNA, also designated SEQ ID:311.

[18658] Another function of GAM111 is therefore inhibition of Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession NM_004668.1), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of

GAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAM.

[18659] The function of MGAM has been established by previous studies. Maltase- glucoamylase (MGA; EC 3.2.1.20) is a brush border membrane enzyme that plays a role in the final steps of digestion of starch. Naim et al. (1988) showed that it is synthesized as a single- chain polypeptide precursor, acquires N- and O- linked carbohydrates, and does not undergo intracellular or extracellular proteolytic cleavage. Nichols et al. (1998) purified and partially sequenced the human maltase- glucoamylase protein. By RT- PCR using degenerate oligonucleotides based on the MGA protein sequence, they isolated human small intestine MGA cDNAs. The deduced 1,857- amino acid MGA protein has a putative type II membrane anchor, 2 WIDMNE catalytic sites, which are characteristic of carbohydrate hydrolases such as sucrase- isomaltase (SI; 222900), and 2 glycosyl hydrolase family 31 signature 2 sequences. MGA also has 19 potential N- glycosylation sites and 253 potential O- glycosylation sites. The MGA protein shares 59% sequence identity with SI. RT- PCR detected MGA expression in human small intestine, granulocyte, and kidney but not in salivary gland or pancreas.

[18660]

[18661] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18662] Naim, H. Y.; Sterchi, E. E.; Lentze, M. J. : Structure, biosynthesis, and glycosylation of human small intestinal maltase- glucoamylase. J. Biol. Chem. 263: 19709- 19717, 1988. ; and

[18663] Nichols, B. L.; Eldering, J.; Avery, S.; Hahn, D.; Quaroni, A.; Sterchi, E. : Human small intestinal maltase- glucoamylase cDNA cloning: homology to sucrase- isomaltase. J. Biol. Chem. 273: 3.

[18664] Further studies establishing the function and utilities of MGAM are found in John Hopkins OMIM database record ID 154360, and in cited publications listed in Table 5, which are hereby incorporated by reference.Peroxisome proliferative activated receptor, alpha (PPARA, Accession NM_005036.2) is another GAM111 target gene, herein designated TARGET GENE. PPARA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PPARA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of PPARA BINDING SITE, designated SEQ ID:5628, to the nucleotide sequence of GAM111 RNA, herein designated GAM RNA, also designated SEQ ID:311.

[18665] Another function of GAM111 is therefore inhibition of Peroxisome proliferative activated receptor, alpha (PPARA, Accession NM_005036.2), a gene which controls the peroxisomal beta- oxidation pathway of fatty acids by activating transcription of acyl- coa oxidase gene. and therefore may be associated with Obesity. Accordingly, utilities of GAM111 include diagnosis, prevention and treatment of Obesity, and of other diseases and clinical conditions associated with PPARA.

[18666] The function of PPARA has been established by previous studies. Kersten et al. (2000) reviewed the roles of PPARs in health and disease

[18667] Animal model experiments lend further support to the function of PPARA. Adenovirus- induced hyperleptinemia (see OMIM Ref. No. leptin; 164160) causes rapid disappearance of body fat in normal rats, presumably by upregulating fatty acid oxidation within white adipocytes. To determine the role of PPARA expression, which was increased during the rapid loss of fat, Lee et al. (2002) infused adenovirus- leptin into PPARA- null and PPARA-

wildtype mice. Despite similar degrees of hyperleptinemia and reduction in food intake, epididymal fat pad weight declined 55% in wildtype but only 6% in null mice; liver triacylglycerol fell 39% in the wildtype group but was unchanged in the null group. Carnitine palmitoyltransferase-1 (OMIM Ref. No. 600528) mRNA rose 52% in the wildtype mice but did not increase in the null mice. The most striking transcription difference was the 3- fold rise in PGC1-alpha (PPARGC1; 604517) mRNA in white adipose tissue that occurred in PPARA- wildtype but not in PPARA- null mice. Moreover, baseline expression of PGC1- alpha in the null mice was below normal. The role of the PGC1 coactivator in mitochondrial biogenesis, thermogenesis, and gluconeogenesis is well established. Lee et al. (2002) found the most plausible interpretation of the findings in white adipose tissue to be that leptin induces, through upregulation of PGC1- alpha expression, a PPARA- dependent increase in mitochondrial biogenesis that increases fatty acid oxidation sufficiently to deplete triglyceride stores with a relatively modest increase in the transcription and/or activities of the enzymes of fatty acid oxidation. During the sustained hyperleptinemia induced by adenovirus transfer of the leptin gene, white adipocytes

acquire features of brown adipocytes and are converted from fat- storing to fat- burning cells, in large part through upregulation of PGC1- alpha.

[18668] It is appreciated that the abovementioned animal model for PPARA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[18669] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18670] Kersten, S.; Desvergne, B.; Wahli, W. : Roles of PPARs in health and disease. Nature 405: 421- 424, 2000. ; and

[18671] Lee, Y.; Yu, X.; Gonzales, F.; Mangelsdorf, D. J.; Wang, M.- Y.; Richardson, C.; Witters, L. A.; Unger, R. H. : PPAR- alpha is necessary for the lipopenic action of hyperleptinemia on whi.

[18672] Further studies establishing the function and utilities of PPARA are found in John Hopkins OMIM database record ID 170998, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[18673] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 112

(GAM112), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18674] GAM112 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM112 was detected is described hereinabove with reference to Figs. 8-15.

[18675] GAM112 gene, herein designated GAM GENE, and GAM112 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18676] GAM112 gene encodes a GAM112 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM112 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM112 precursor RNA is designated SEQ ID:195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:195 is located at position 47490563 relative to chromosome X.

[18677] GAM112 precursor RNA folds onto itself, forming GAM112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18678] GAM112 precursor RNA folds onto itself, forming GAM112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18679] Nucleotide sequence of GAM112 precursor RNA, designated SEQ-ID: 195, and a schematic representation of a predicted secondary folding of GAM112 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18680] An enzyme complex designated DICER COMPLEX, `dices` the GAM112 folded precursor RNA into GAM112 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM112 RNA is designated SEQ ID:263, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18681] GAM112 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM112 target RNA, herein designated GAM TARGET RNA. GAM112 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18682] GAM112 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM112 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM112 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such

target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM112 RNA may have a different number of target binding sites in untranslated regions of a GAM112 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18683] The complementary binding of GAM112 RNA, herein designated GAM RNA, to target binding sites on GAM112 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM112 target RNA into GAM112 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18684] It is appreciated that GAM112 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM112 target genes. The mRNA of each one of this plurality of GAM112 target genes comprises one or more target binding sites, each having a nucleotide sequence

which is at least partly complementary to GAM112 RNA, herein designated GAM RNA, and which when bound by GAM112 RNA causes inhibition of translation of respective one or more GAM112 target proteins.

[18685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM112 gene, herein designated GAM GENE, on one or more GAM112 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18686] It is appreciated that specific functions and accordingly utilities of GAM112 correlate with, and may be deduced from, the identity of the target genes which GAM112

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18687]

[18688]

[18689] Arp1 actin-related protein 1 homolog a, centractin alpha (yeast) (ACTR1A, Accession NP_005727.1) is a GAM112 target gene, herein designated TARGET GENE. ACTR1A BINDING SITE is a target binding site found in the 3` un-translated region of mRNA encoded by ACTR1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE, designated SEQ ID:16686, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18690] A function of GAM112 is therefore inhibition of Arp1 actin-related protein 1 homolog a, centractin alpha (yeast) (ACTR1A, Accession NP_005727.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1A.

[18691] APRIN (Accession NP_055847.1) is another GAM112 target

gene, herein designated TARGET GENE. APRIN BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APRIN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APRIN BINDING SITE, designated SEQ ID:18895, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18692] Another function of GAM112 is therefore inhibition of APRIN (Accession NP_055847.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APRIN.

[18693] Atpase, na+/k+ transporting, alpha 2 (+) polypeptide (ATP1A2, Accession NP_000693.1) is another GAM112 target gene, herein designated TARGET GENE. ATP1A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:4788, to the nucleotide sequence of GAM112 RNA, herein designated

GAM RNA, also designated SEQ ID:263.

[18694] Another function of GAM112 is therefore inhibition of Atpase, na+/k+ transporting, alpha 2 (+) polypeptide (ATP1A2, Accession NP_000693.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2.

[18695] Caudal type homeo box transcription factor 2 (CDX2, Accession NP_001256.1) is another GAM112 target gene, herein designated TARGET GENE. CDX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDX2 BINDING SITE, designated SEQ ID:6285, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18696] Another function of GAM112 is therefore inhibition of Caudal type homeo box transcription factor 2 (CDX2, Accession NP_001256.1), a gene which is involved in the transciptional regulation of multiple genes expressed in the intestinal epithelium. Accordingly, utilities of GAM112

include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDX2.

[18697] The function of CDX2 has been established by previous studies. The level and beta- cell specificity of insulin gene expression are regulated by a set of nuclear proteins that bind to specific sequences within the promoter of the insulin gene (INS; 176730) and interact with RNA polymerase to activate or repress transcription. The proteins LMX1 (OMIM Ref. No. 600298) and CDX3 are homeodomain proteins that bind an A/T- rich sequence in the insulin promoter and stimulate its transcription. German et al. (1994) demonstrated by fluorescence in situ hybridization that the CDX3 gene is located on 13q12.3. The gene encoding another insulin- regulating transcription factor, ISL1 (OMIM Ref. No. 600366), maps to 5q. In Drosophila, disturbing the expression of the homeo box gene 'caudal' causes a severe disruption in body segmentation and global body patterning. In the mouse, 3 homologs of Drosophila 'caudal' were identified: Cdx1 (OMIM Ref. No. 600746), Cdx2, and Cdx4 (OMIM Ref. No. 300025). By homologous recombination in embryonic stem (ES) cells, Chawengsaksophak et al. (1997) generated a null mutation of murine Cdx2. Homozygote null mutants

died between 3.5 and 5.5 days postcoitum. Heterozygous mutants exhibited a variable phenotype, with many showing tail abnormalities or stunted growth. Skeletal analysis demonstrated a homeotic shift of vertebrae and compatible malformations of the ribs. Within the first 3 months of life, 90% of Cdx2 heterozygotes developed multiple intestinal adenomatous polyps, particularly in the proximal colon. These polyps occasionally contained areas of true metaplasia. In contrast to the surrounding intestinal epithelium, the neoplastic cells did not express Cdx2 from the remaining allele. These results suggested that Cdx2 mutation is the primary event in the genesis of these intestinal tumors, a 2- hit phenomenon having been involved in their pathogenesis.

[18698]

[18699] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18700] German, M. S.; Wang, J.; Fernald, A. A.; Espinosa, R., III; Le Beau, M. M.; Bell, G. I. : Localization of the genes encoding two transcription factors, LMX1 and CDX3, regulating insulin gene expression to human chromosomes 1 and 13. Genomics 24: 403- 404, 1994. ; and

[18701] Chawengsaksophak, K.; James, R.; Hammond, V. E.; Kontgen, F.; Beck, F. : Homeosis and intestinal tumours in Cdx2 mutant mice. Nature 386: 84- 87, 1997.

[18702] Further studies establishing the function and utilities of CDX2 are found in John Hopkins OMIM database record ID 600297, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carbamoyl-phosphate synthetase 1, mitochondrial (CPS1, Accession NP_001866.2) is another GAM112 target gene, herein designated TARGET GENE. CPS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPS1 BINDING SITE, designated SEQ ID:7610, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18703] Another function of GAM112 is therefore inhibition of Carbamoyl-phosphate synthetase 1, mitochondrial (CPS1, Accession NP_001866.2) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPS1.

[18704] Cytochrome p450, subfamily viia (cholesterol 7 alpha-monooxygenase), polypeptide 1 (CYP7A1, Accession NP_000771.1) is another GAM112 target gene, herein designated TARGET GENE. CYP7A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP7A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP7A1 BINDING SITE, designated SEQ ID:7483, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18705] Another function of GAM112 is therefore inhibition of Cytochrome p450, subfamily viia (cholesterol 7 alpha-monooxygenase), polypeptide 1 (CYP7A1, Accession NP_000771.1), a gene which functions in cholesterol and bile acid metabolism . and therefore may be associated with Metabolic liver disease. Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of Metabolic liver disease, and of other diseases and clinical conditions associated with CYP7A1.

[18706] The function of CYP7A1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM100.1.Cysteinyl leukotriene receptor 2 (CYSLTR2, Accession NP_065110.1) is another GAM112 target gene, herein designated TARGET GENE. CYSLTR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYSLTR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYSLTR2 BINDING SITE, designated SEQ ID:8375, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18707] Another function of GAM112 is therefore inhibition of Cysteinyl leukotriene receptor 2 (CYSLTR2, Accession NP_065110.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYSLTR2.

[18708] Erythrocyte membrane protein band 4.1 like 4b (EPB41L4B, Accession NP_061987.2) is another GAM112 target gene, herein designated TARGET GENE. EPB41L4B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EPB41L4B, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPB41L4B BINDING SITE, designated SEQ ID:9787, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18709] Another function of GAM112 is therefore inhibition of Erythrocyte membrane protein band 4.1 like 4b (EPB41L4B, Accession NP_061987.2) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L4B.

[18710] FLJ10378 (Accession NP_115615.2) is another GAM112 target gene, herein designated TARGET GENE. FLJ10378 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ10378, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10378 BINDING SITE, designated SEQ ID:1040, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18711] Another function of GAM112 is therefore inhibition of FLJ10378 (Accession NP_115615.2) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10378.

[18712] FLJ11710 (Accession NP_079122.1) is another GAM112 target gene, herein designated TARGET GENE. FLJ11710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11710, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:16607, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18713] Another function of GAM112 is therefore inhibition of FLJ11710 (Accession NP_079122.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710.

[18714] FLJ12921 (Accession NP_079151.1) is another GAM112 target gene, herein designated TARGET GENE. FLJ12921 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12921, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ12921 BINDING SITE, designated SEQ ID:8731, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18715] Another function of GAM112 is therefore inhibition of FLJ12921 (Accession NP_079151.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12921.

[18716] FLJ22029 (Accession NP_079225.2) is another GAM112 target gene, herein designated TARGET GENE. FLJ22029 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22029, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22029 BINDING SITE, designated SEQ ID:9484, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18717] Another function of GAM112 is therefore inhibition of FLJ22029 (Accession NP_079225.2) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22029.

[18718] FLJ36812 (Accession NP_694992.1) is another GAM112 target gene, herein designated TARGET GENE. FLJ36812 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36812 BINDING SITE, designated SEQ ID:9912, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18719] Another function of GAM112 is therefore inhibition of FLJ36812 (Accession NP_694992.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36812.

[18720] Grb2-associated binding protein 2 (GAB2, Accession NP_536739.1) is another GAM112 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:4928, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18721] Another function of GAM112 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NP_536739.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[18722] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Grb2-associated binding protein 2 (GAB2, Accession NP_036428.1) is another GAM112 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:4928, to the nucleotide sequence of GAM112 RNA, herein designated

GAM RNA, also designated SEQ ID:263.

[18723] Another function of GAM112 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NP_036428.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[18724] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Gephyrin (GPHN, Accession NP_065857.1) is another GAM112 target gene, herein designated TARGET GENE. GPHN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPHN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPHN BINDING SITE, designated SEQ ID:7304, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18725] Another function of GAM112 is therefore inhibition of Gephyrin (GPHN, Accession NP_065857.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with GPHN.

[18726] GPP34R (Accession NP_060648.2) is another GAM112 target gene, herein designated TARGET GENE. GPP34R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPP34R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPP34R BINDING SITE, designated SEQ ID:7889, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18727] Another function of GAM112 is therefore inhibition of GPP34R (Accession NP_060648.2) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPP34R.

[18728] Hira interacting protein 3 (HIRIP3, Accession NP_003600.2) is another GAM112 target gene, herein designated TARGET GENE. HIRIP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HIRIP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of HIRIP3 BINDING SITE, designated SEQ ID:7164, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18729] Another function of GAM112 is therefore inhibition of Hira interacting protein 3 (HIRIP3, Accession NP_003600.2) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIRIP3.

[18730] Heterogeneous nuclear ribonucleoprotein a/b (HNRPAB, Accession NP_004490.1) is another GAM112 target gene, herein designated TARGET GENE. HNRPAB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPAB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNRPAB BINDING SITE, designated SEQ ID:1037, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18731] Another function of GAM112 is therefore inhibition of Heterogeneous nuclear ribonucleoprotein a/b (HNRPAB, Accession NP_004490.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HNRPAB.

[18732] Heterogeneous nuclear ribonucleoprotein a/b (HNRPAB, Accession NP_112556.1) is another GAM112 target gene, herein designated TARGET GENE. HNRPAB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPAB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNRPAB BINDING SITE, designated SEQ ID:1037, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18733] Another function of GAM112 is therefore inhibition of Heterogeneous nuclear ribonucleoprotein a/b (HNRPAB, Accession NP_112556.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPAB.

[18734] KIAA0493 (Accession XP_034717.1) is another GAM112 target gene, herein designated TARGET GENE. KIAA0493 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:5227, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18735] Another function of GAM112 is therefore inhibition of KIAA0493 (Accession XP_034717.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493.

[18736] KIAA0564 (Accession XP_038664.6) is another GAM112 target gene, herein designated TARGET GENE. KIAA0564 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0564, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:15894, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18737] Another function of GAM112 is therefore inhibition of KIAA0564 (Accession XP_038664.6) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0564.

[18738] KIAA1796 (Accession XP_166146.3) is another GAM112 target gene, herein designated TARGET GENE. KIAA1796 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1796, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:12645, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18739] Another function of GAM112 is therefore inhibition of KIAA1796 (Accession XP_166146.3) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1796.

[18740] LAP1B (Accession NP_056417.1) is another GAM112 target gene, herein designated TARGET GENE. LAP1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAP1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAP1B BIND-

ING SITE, designated SEQ ID:1138, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18741] Another function of GAM112 is therefore inhibition of LAP1B (Accession NP_056417.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAP1B.

[18742] Lim and sh3 protein 1 (LASP1, Accession NP_006139.1) is another GAM112 target gene, herein designated TARGET GENE. LASP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LASP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:13445, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18743] Another function of GAM112 is therefore inhibition of Lim and sh3 protein 1 (LASP1, Accession NP_006139.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1.

[18744] LOC145231 (Accession XP_096740.1) is another GAM112

target gene, herein designated TARGET GENE. LOC145231 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145231, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:13603, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18745] Another function of GAM112 is therefore inhibition of LOC145231 (Accession XP_096740.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231.

[18746] LOC146346 (Accession XP_085430.1) is another GAM112 target gene, herein designated TARGET GENE. LOC146346 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146346 BINDING SITE, designated SEQ ID:10788, to the nucleotide sequence of GAM112 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:263.

[18747] Another function of GAM112 is therefore inhibition of LOC146346 (Accession XP_085430.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146346.

[18748] LOC283547 (Accession XP_211120.1) is another GAM112 target gene, herein designated TARGET GENE. LOC283547 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283547, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283547 BINDING SITE, designated SEQ ID:18815, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18749] Another function of GAM112 is therefore inhibition of LOC283547 (Accession XP_211120.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283547.

[18750] LOC284378 (Accession XP_209131.1) is another GAM112 target gene, herein designated TARGET GENE. LOC284378

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284378, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284378 BINDING SITE, designated SEQ ID:13825, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18751] Another function of GAM112 is therefore inhibition of LOC284378 (Accession XP_209131.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284378.

[18752] LOC284568 (Accession XP_209263.1) is another GAM112 target gene, herein designated TARGET GENE. LOC284568 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284568, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284568 BINDING SITE, designated SEQ ID:5227, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18753] Another function of GAM112 is therefore inhibition of LOC284568 (Accession XP_209263.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284568.

[18754] LOC284805 (Accession XP_209371.1) is another GAM112 target gene, herein designated TARGET GENE. LOC284805 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284805 BINDING SITE, designated SEQ ID:7153, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18755] Another function of GAM112 is therefore inhibition of LOC284805 (Accession XP_209371.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284805.

[18756] LOC284955 (Accession XP_208268.1) is another GAM112 target gene, herein designated TARGET GENE. LOC284955 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284955, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284955 BINDING SITE, designated SEQ ID:20187, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18757] Another function of GAM112 is therefore inhibition of LOC284955 (Accession XP_208268.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284955.

[18758] LOC286207 (Accession XP_209941.1) is another GAM112 target gene, herein designated TARGET GENE. LOC286207 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286207, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286207 BINDING SITE, designated SEQ ID:5356, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18759] Another function of GAM112 is therefore inhibition of

LOC286207 (Accession XP_209941.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286207.

[18760] LOC345610 (Accession XP_298913.2) is another GAM112 target gene, herein designated TARGET GENE. LOC345610 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC345610, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC345610 BINDING SITE, designated SEQ ID:19831, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18761] Another function of GAM112 is therefore inhibition of LOC345610 (Accession XP_298913.2) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC345610.

[18762] LOC346625 (Accession XP_299603.1) is another GAM112 target gene, herein designated TARGET GENE. LOC346625 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC346625, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC346625 BINDING SITE, designated SEQ ID:11576, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18763] Another function of GAM112 is therefore inhibition of LOC346625 (Accession XP_299603.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC346625.

[18764] LOC348416 (Accession XP_300733.1) is another GAM112 target gene, herein designated TARGET GENE. LOC348416 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348416 BINDING SITE, designated SEQ ID:2541, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18765] Another function of GAM112 is therefore inhibition of LOC348416 (Accession XP_300733.1) . Accordingly, utili-

ties of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348416.

[18766] LOC348836 (Accession XP_300859.1) is another GAM112 target gene, herein designated TARGET GENE. LOC348836 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348836, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348836 BINDING SITE, designated SEQ ID:533, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18767] Another function of GAM112 is therefore inhibition of LOC348836 (Accession XP_300859.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348836.

[18768] Lim domain containing preferred translocation partner in lipoma (LPP, Accession NP_005569.1) is another GAM112 target gene, herein designated TARGET GENE. LPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LPP, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LPP BINDING SITE, designated SEQ ID:11376, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18769] Another function of GAM112 is therefore inhibition of Lim domain containing preferred translocation partner in lipoma (LPP, Accession NP_005569.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPP.

[18770] MGC4677 (Accession NP_443103.1) is another GAM112 target gene, herein designated TARGET GENE. MGC4677 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4677, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4677 BINDING SITE, designated SEQ ID:20187, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18771] Another function of GAM112 is therefore inhibition of

MGC4677 (Accession NP_443103.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4677.

[18772] Midline 1 (opitz/bbb syndrome) (MID1, Accession NP_150633.1) is another GAM112 target gene, herein designated TARGET GENE. MID1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MID1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MID1 BINDING SITE, designated SEQ ID:3318, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18773] Another function of GAM112 is therefore inhibition of Midline 1 (opitz/bbb syndrome) (MID1, Accession NP_150633.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MID1.

[18774] Midline 1 (opitz/bbb syndrome) (MID1, Accession NP_000372.1) is another GAM112 target gene, herein designated TARGET GENE. MID1 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MID1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MID1 BINDING SITE, designated SEQ ID:3318, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18775] Another function of GAM112 is therefore inhibition of Midline 1 (opitz/bbb syndrome) (MID1, Accession NP_000372.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MID1.

[18776] Pleiomorphic adenoma gene 1 (PLAG1, Accession NP_002646.1) is another GAM112 target gene, herein designated TARGET GENE. PLAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:11279, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ

ID:263.

[18777] Another function of GAM112 is therefore inhibition of Pleiomorphic adenoma gene 1 (PLAG1, Accession NP_002646.1), a gene which contains a zinc finger domain. Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1.

[18778] The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Sp2 transcription factor (SP2, Accession NP_003101.2) is another GAM112 target gene, herein designated TARGET GENE. SP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SP2 BINDING SITE, designated SEQ ID:9721, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18779] Another function of GAM112 is therefore inhibition of Sp2 transcription factor (SP2, Accession NP_003101.2) . Accordingly, utilities of GAM112 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with SP2.

[18780] Zinc finger protein 216 (ZNF216, Accession NP_005998.1) is another GAM112 target gene, herein designated TARGET GENE. ZNF216 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF216, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF216 BINDING SITE, designated SEQ ID:14718, to the nucleotide sequence of GAM112 RNA, herein designated GAM RNA, also designated SEQ ID:263.

[18781] Another function of GAM112 is therefore inhibition of Zinc finger protein 216 (ZNF216, Accession NP_005998.1) . Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF216.

[18782]

[18783] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 113 (GAM113), which modulates expression of respective tar-

get genes thereof, the function and utility of which target genes is known in the art.

[18784] GAM113 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM113 was detected is described hereinabove with reference to Figs. 8-15.

[18785] GAM113 gene, herein designated GAM GENE, and GAM113 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18786] GAM113 gene encodes a GAM113 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM113 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM113 precursor RNA is designated SEQ ID:74, and is provided hereinbelow with reference to the sequence listing part.

[18787] GAM113 precursor RNA folds onto itself, forming GAM113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18788] GAM113 precursor RNA folds onto itself, forming GAM113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18789] Nucleotide sequence of GAM113 precursor RNA, designated SEQ-ID: 74, and a schematic representation of a predicted secondary folding of GAM113 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18790] An enzyme complex designated DICER COMPLEX, `dices` the GAM113 folded precursor RNA into GAM113 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM113 RNA is designated SEQ ID:233, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18791] GAM113 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM113 target RNA, herein designated GAM TARGET RNA. GAM113 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18792] GAM113 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM113 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM113 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM113 RNA may have a different number of target binding sites in untranslated regions of a GAM113 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18793] The complementary binding of GAM113 RNA, herein designated GAM RNA, to target binding sites on GAM113 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM113 target RNA into GAM113 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18794] It is appreciated that GAM113 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM113 target genes. The mRNA of each one of this plurality of GAM113 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM113 RNA, herein designated GAM RNA, and which when bound by

GAM113 RNA causes inhibition of translation of respective one or more GAM113 target proteins.

[18795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM113 gene, herein designated GAM GENE, on one or more GAM113 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18796] It is appreciated that specific functions and accordingly utilities of GAM113 correlate with, and may be deduced from, the identity of the target genes which GAM113 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18797]

[18798]

[18799] Chromosome 20 open reading frame 27 (C20orf27, Accession NM_017874.1) is a GAM113 target gene, herein designated TARGET GENE. C20orf27 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C20orf27, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf27 BINDING SITE, designated SEQ ID:12502, to the nucleotide sequence of GAM113 RNA, herein designated GAM RNA, also designated SEQ ID:233.

[18800] A function of GAM113 is therefore inhibition of Chromosome 20 open reading frame 27 (C20orf27, Accession NM_017874.1) . Accordingly, utilities of GAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf27.

[18801] LOC255975 (Accession XM_171083.2) is another GAM113 target gene, herein designated TARGET GENE. LOC255975 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255975, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:16326, to the nucleotide sequence of GAM113 RNA, herein designated GAM RNA, also designated SEQ ID:233.

[18802] Another function of GAM113 is therefore inhibition of LOC255975 (Accession XM_171083.2) . Accordingly, utilities of GAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975.

[18803] LOC92017 (Accession XM_042234.3) is another GAM113 target gene, herein designated TARGET GENE. LOC92017 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92017, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92017 BINDING SITE, designated SEQ ID:12778, to the nucleotide sequence of GAM113 RNA, herein designated GAM RNA, also designated SEQ ID:233.

[18804] Another function of GAM113 is therefore inhibition of LOC92017 (Accession XM_042234.3) . Accordingly, utili-

ties of GAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92017.

[18805]

[18806] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 114 (GAM114), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18807] GAM114 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM114 was detected is described hereinabove with reference to Figs. 8-15.

[18808] GAM114 gene, herein designated GAM GENE, and GAM114 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18809] GAM114 gene encodes a GAM114 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM114 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM114 precursor RNA is designated SEQ ID:75, and is

provided hereinbelow with reference to the sequence listing part.

[18810] GAM114 precursor RNA folds onto itself, forming GAM114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18811] GAM114 precursor RNA folds onto itself, forming GAM114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18812] Nucleotide sequence of GAM114 precursor RNA, designated SEQ-ID: 75, and a schematic representation of a predicted secondary folding of GAM114 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[18813] An enzyme complex designated DICER COMPLEX, `dices` the GAM114 folded precursor RNA into GAM114 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM114 RNA is designated SEQ ID:288, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18814] GAM114 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM114 target RNA, herein designated GAM TARGET RNA. GAM114 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18815] GAM114 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM114 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM114 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM114 RNA may have a different number of target binding sites in untranslated regions of a GAM114 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18816] The complementary binding of GAM114 RNA, herein designated GAM RNA, to target binding sites on GAM114 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM114 target RNA into GAM114 target protein, herein designated GAM TARGET PROTEIN.

GAM target protein is therefore outlined by a broken line.

[18817] It is appreciated that GAM114 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM114 target genes. The mRNA of each one of this plurality of GAM114 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM114 RNA, herein designated GAM RNA, and which when bound by GAM114 RNA causes inhibition of translation of respective one or more GAM114 target proteins.

[18818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM114 gene, herein designated GAM GENE, on one or more GAM114 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18819] It is appreciated that specific functions and accordingly utilities of GAM114 correlate with, and may be deduced from, the identity of the target genes which GAM114 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18820]

[18821]

[18822] ATP10C (Accession) is a GAM114 target gene, herein designated TARGET GENE. ATP10C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP10C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP10C BINDING SITE, designated SEQ ID:17918, to the nucleotide sequence of GAM114 RNA, herein designated GAM RNA, also designated SEQ ID:288.

[18823] A function of GAM114 is therefore inhibition of ATP10C (Accession), a gene which is phosphorylated in their in-

termediate state, drives uphill transport of ions across membranes and therefore may be associated with Angelman syndrome, obesity resembling that of prader- willi syndrome. Accordingly, utilities of GAM114 include diagnosis, prevention and treatment of Angelman syndrome, obesity resembling that of prader- willi syndrome, and of other diseases and clinical conditions associated with ATP10C.

[18824] The function of ATP10C has been established by previous studies. Meguro et al. (2001) reported that the ATP10C gene is maternally expressed, that it maps within the most common interval of deletion responsible for Angelman syndrome (AS; 105830) (15q11- q13), and that ATP10C expression is virtually absent from Angelman syndrome patients with imprinting mutations, as well as from patients with maternal deletions of 15q11- q13. Previously, although AS patients infrequently have mutations in the UBE3A gene (OMIM Ref. No. 601623), which encodes a ubiquitin ligase required for long- term synaptic potentiation (LTP), most cases were attributable to de novo maternal deletions of the critical 15q region. Herzing et al. (2001) reported that ATP10C maps within 200 kb distal to UBE3A and, like UBE3A, demonstrates imprinted,

preferential maternal expression in human brain. They suggested that ATP10C is a candidate for chromosome 15- associated autism as well as the Angelman syndrome phenotype.

[18825] Animal model experiments lend further support to the function of ATP10C. Dhar et al. (2000) reported that maternal inheritance of deletions of the mouse Atp10c gene resulted in increased body fat. The obese phenotype was consistently observed in the mouse model for Angelman syndrome with paternal uniparental disomy (Cattanach et al., 1997). Meguro et al. (2001) speculated that ATP10C may be an aminophospholipid translocase involved in phospholipid transport.

[18826] It is appreciated that the abovementioned animal model for ATP10C is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[18827] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18828] Meguro, M.; Kashiwagi, A.; Mitsuya, K.; Nakao, M.; Kondo, I.; Saitoh, S.; Oshimura, M. : A novel maternally expressed gene, ATP10C, encodes a putative aminophospholipid

translocase associated with Angelman syndrome. Nature Genet. 28: 19- 20, 2001. ; and

[18829] Cattanach, B. M.; Barr, J. A.; Beechey, C. V.; Martin, J.; Noebels, J.; Jones, J. : A candidate model for Angelman syndrome in the mouse. Mammalian Genome 8: 472-478, 1997.

[18830] Further studies establishing the function and utilities of ATP10C are found in John Hopkins OMIM database record ID 605855, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[18831] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 115 (GAM115), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18832] GAM115 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM115 was detected is described hereinabove with reference to Figs. 8-15.

[18833] GAM115 gene, herein designated GAM GENE, and GAM115 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18834] GAM115 gene encodes a GAM115 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM115 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM115 precursor RNA is designated SEQ ID:103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:103 is located at position 80233984 relative to chromosome 17.

[18835] GAM115 precursor RNA folds onto itself, forming GAM115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18836] GAM115 precursor RNA folds onto itself, forming GAM115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18837] Nucleotide sequence of GAM115 precursor RNA, designated SEQ-ID: 103, and a schematic representation of a predicted secondary folding of GAM115 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18838] An enzyme complex designated DICER COMPLEX, `dices` the GAM115 folded precursor RNA into GAM115 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM115 RNA is designated SEQ ID:229, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18839] GAM115 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM115 target

RNA, herein designated GAM TARGET RNA. GAM115 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18840] GAM115 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM115 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM115 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM115 RNA may have a different number of target binding sites in untranslated regions of a GAM115 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[18841] The complementary binding of GAM115 RNA, herein designated GAM RNA, to target binding sites on GAM115 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM115 target RNA into GAM115 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18842] It is appreciated that GAM115 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM115 target genes. The mRNA of each one of this plurality of GAM115 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM115 RNA, herein designated GAM RNA, and which when bound by GAM115 RNA causes inhibition of translation of respective one or more GAM115 target proteins.

[18843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM115 gene, herein designated GAM GENE, on one or more GAM115 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes.

As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18844] It is appreciated that specific functions and accordingly utilities of GAM115 correlate with, and may be deduced from, the identity of the target genes which GAM115 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18845]

[18846]

[18847] FLJ20257 (Accession NM_019606.3) is a GAM115 target gene, herein designated TARGET GENE. FLJ20257 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20257 BINDING SITE, designated SEQ ID:3143, to the nucleotide sequence of GAM115 RNA, herein designated GAM RNA, also designated SEQ ID:229.

[18848] A function of GAM115 is therefore inhibition of FLJ20257 (Accession NM_019606.3) . Accordingly, utilities of GAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20257.

[18849] LOC201627 (Accession) is another GAM115 target gene, herein designated TARGET GENE. LOC201627 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201627, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:10333, to the nucleotide sequence of GAM115 RNA, herein designated GAM RNA, also designated SEQ ID:229.

[18850] Another function of GAM115 is therefore inhibition of LOC201627 (Accession) . Accordingly, utilities of GAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201627.

[18851] LOC51015 (Accession) is another GAM115 target gene, herein designated TARGET GENE. LOC51015 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51015, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51015 BINDING SITE, designated SEQ ID:14480, to the nucleotide sequence of GAM115 RNA, herein designated GAM RNA, also designated SEQ ID:229.

[18852] Another function of GAM115 is therefore inhibition of LOC51015 (Accession) . Accordingly, utilities of GAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51015.

[18853] Protease, serine, 21 (testisin) (PRSS21, Accession NM_006799.2) is another GAM115 target gene, herein designated TARGET GENE. PRSS21 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRSS21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

PRSS21 BINDING SITE, designated SEQ ID:3015, to the nucleotide sequence of GAM115 RNA, herein designated GAM RNA, also designated SEQ ID:229.

[18854] Another function of GAM115 is therefore inhibition of Protease, serine, 21 (testisin) (PRSS21, Accession NM_006799.2) . Accordingly, utilities of GAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSS21.

[18855]

[18856] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 116 (GAM116), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18857] GAM116 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM116 was detected is described hereinabove with reference to Figs. 8-15.

[18858] GAM116 gene, herein designated GAM GENE, and GAM116 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[18859] GAM116 gene encodes a GAM116 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM116 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM116 precursor RNA is designated SEQ ID:100, and is provided hereinbelow with reference to the sequence listing part.

[18860] GAM116 precursor RNA folds onto itself, forming GAM116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18861] GAM116 precursor RNA folds onto itself, forming GAM116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[18862] Nucleotide sequence of GAM116 precursor RNA, designated SEQ-ID: 100, and a schematic representation of a predicted secondary folding of GAM116 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[18863] An enzyme complex designated DICER COMPLEX, `dices` the GAM116 folded precursor RNA into GAM116 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM116 RNA is designated SEQ ID:301, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[18864] GAM116 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM116 target RNA, herein designated GAM TARGET RNA. GAM116 target RNA comprises three regions, as is typical of mRNA of

a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18865] GAM116 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM116 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM116 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM116 RNA may have a different number of target binding sites in untranslated regions of a GAM116 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18866] The complementary binding of GAM116 RNA, herein des-

ignated GAM RNA, to target binding sites on GAM116 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM116 target RNA into GAM116 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18867] It is appreciated that GAM116 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM116 target genes. The mRNA of each one of this plurality of GAM116 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM116 RNA, herein designated GAM RNA, and which when bound by GAM116 RNA causes inhibition of translation of respective one or more GAM116 target proteins.

[18868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM116 gene, herein designated GAM GENE, on one or more GAM116 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18869] It is appreciated that specific functions and accordingly utilities of GAM116 correlate with, and may be deduced from, the identity of the target genes which GAM116 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18870]

[18871]

[18872] Acyl-coenzyme a dehydrogenase, long chain (ACADL, Accession NP_001599.1) is a GAM116 target gene, herein designated TARGET GENE. ACADL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACADL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of ACADL BINDING SITE, designated SEQ ID:2475, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18873] A function of GAM116 is therefore inhibition of Acyl-coenzyme a dehydrogenase, long chain (ACADL, Accession NP_001599.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADL.

[18874] AD023 (Accession NP_065730.2) is another GAM116 target gene, herein designated TARGET GENE. AD023 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AD023, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AD023 BINDING SITE, designated SEQ ID:12888, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18875] Another function of GAM116 is therefore inhibition of AD023 (Accession NP_065730.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD023.

[18876] Adenosine kinase (ADK, Accession NP_001114.1) is an-

other GAM116 target gene, herein designated TARGET GENE. ADK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADK BINDING SITE, designated SEQ ID:19386, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18877] Another function of GAM116 is therefore inhibition of Adenosine kinase (ADK, Accession NP_001114.1), a gene which Adenosine kinase; catalyzes conversion of adenosine to AMP. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADK.

[18878] The function of ADK has been established by previous studies. Adenosine kinase (ATP:adenosine 5- prime-phosphotransferase; EC 2.7.1.20) is an abundant enzyme in mammalian tissues that catalyzes the transfer of the gamma- phosphate from ATP to adenosine, thereby serving as a potentially important regulator of concentrations of both extracellular adenosine and intracellular adenine

nucleotides. Adenosine has widespread effects on the cardiovascular, nervous, respiratory, and immune systems and inhibitors of ADK could play an important pharmacological role in increasing intravascular adenosine concentrations and acting as antiinflammatory agents. Spychala et al. (1996) obtained full- length cDNA clones encoding catalytically active ADK from lymphocyte, placental, and liver cDNA libraries. On Northern blots of all tissues examined, they identified mRNA species of 1.3 and 1.8 kb, attributable to alternative polyadenylation sites at the 3-prime end of the gene. The encoded protein consisted of 345 amino acids with a calculated molecular size of 38.7 kD and without any sequence similarities to other well-characterized mammalian nucleoside kinases. In contrast, 2 regions were identified with significant sequence identity to microbial ribokinase and fructokinases and a bacterial inosine/guanosine kinase. Thus, ADK is a structurally distinct mammalian nucleoside kinase that appears to be akin to sugar kinases of microbial origin. McNally et al. (1997) also cloned human cDNAs encoding adenosine kinase. They found cDNAs encoding both the 345- amino acid form and a 362- amino acid form of the enzyme. These 2 alternately spliced forms differed only at the 5-

prime end. When expressed, both isoforms of the enzyme phosphorylated adenosine with identical kinetics and both required Mg2+ for activity. The structural gene for this enzyme was tentatively assigned to chromosome 10 by somatic cell hybrid studies (Klobutcher et al., 1976). By the principle of gene dosage, Francke and Thompson (1979) concluded by exclusion that ADK must be in the region 10q11- 10q24. In a case of trisomy 10p, Snyder et al. (1984) found normal levels of ADK.

[18879] Animal model experiments lend further support to the function of ADK. Boison et al. (2002) pursued the hypothesis that a deficit in adenosine- dependent metabolism is a causative factor for the development of microvesicular hepatic steatosis. A deficiency of adenosine kinase, the major adenosine- removing enzyme of postnatal liver, was expected to affect liver function on 3 levels: availability of adenine nucleotides; disruption of the futile cycle between AMP and adenosine; and maintenance of transmethylation reactions. In homozygous Adk - /- mice, generated through Adk- targeting, embryonic stem cells developed normally during embryogenesis. However, within 4 days after birth they displayed microvesicular hepatic steatosis and died within 14 days with fatty liver.

Adenine nucleotides were decreased and S- adenosylhomocysteine, a potent inhibitor of transmethylation reactions, was increased in the mutant liver.

[18880] It is appreciated that the abovementioned animal model for ADK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[18881] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18882] McNally, T.; Helfrich, R. J.; Cowart, M.; Dorwin, S. A.; Meuth, J. L.; Idler, K. B.; Klute, K. A.; Simmer, R. L.; Kowaluk, E. A.; Halbert, D. N. : Cloning and expression of the adenosine kinase gene from rat and human tissues. Biochem. Biophys. Res. Commun. 231: 645- 650, 1997. ; and

[18883] Boison, D.; Scheurer, L.; Zumsteg, V.; Rulicke, T.; Litynski, P.; Fowler, B.; Brandner, S.; Mohler, H. : Neonatal hepatic steatosis by disruption of the adenosine kinase gene. Proc. Nat.

[18884] Further studies establishing the function and utilities of ADK are found in John Hopkins OMIM database record ID 102750, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Adenosine kinase (ADK, Accession NP_006712.1) is another GAM116 target gene, herein designated TARGET GENE. ADK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADK BINDING SITE, designated SEQ ID:19386, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18885] Another function of GAM116 is therefore inhibition of Adenosine kinase (ADK, Accession NP_006712.1), a gene which Adenosine kinase; catalyzes conversion of adenosine to AMP. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADK.

[18886] The function of ADK has been established by previous studies. Adenosine kinase (ATP:adenosine 5- prime-phosphotransferase; EC 2.7.1.20) is an abundant enzyme in mammalian tissues that catalyzes the transfer of the gamma- phosphate from ATP to adenosine, thereby serving as a potentially important regulator of concentrations

of both extracellular adenosine and intracellular adenine nucleotides. Adenosine has widespread effects on the cardiovascular, nervous, respiratory, and immune systems and inhibitors of ADK could play an important pharmacological role in increasing intravascular adenosine concentrations and acting as antiinflammatory agents. Spychala et al. (1996) obtained full- length cDNA clones encoding catalytically active ADK from lymphocyte, placental, and liver cDNA libraries. On Northern blots of all tissues examined, they identified mRNA species of 1.3 and 1.8 kb, attributable to alternative polyadenylation sites at the 3-prime end of the gene. The encoded protein consisted of 345 amino acids with a calculated molecular size of 38.7 kD and without any sequence similarities to other well-characterized mammalian nucleoside kinases. In contrast, 2 regions were identified with significant sequence identity to microbial ribokinase and fructokinases and a bacterial inosine/guanosine kinase. Thus, ADK is a structurally distinct mammalian nucleoside kinase that appears to be akin to sugar kinases of microbial origin. McNally et al. (1997) also cloned human cDNAs encoding adenosine kinase. They found cDNAs encoding both the 345- amino acid form and a 362- amino acid form of the enzyme.

These 2 alternately spliced forms differed only at the 5-prime end. When expressed, both isoforms of the enzyme phosphorylated adenosine with identical kinetics and both required Mg2+ for activity. The structural gene for this enzyme was tentatively assigned to chromosome 10 by somatic cell hybrid studies (Klobutcher et al., 1976). By the principle of gene dosage, Francke and Thompson (1979) concluded by exclusion that ADK must be in the region 10q11- 10q24. In a case of trisomy 10p, Snyder et al. (1984) found normal levels of ADK.

[18887] Animal model experiments lend further support to the function of ADK. Boison et al. (2002) pursued the hypothesis that a deficit in adenosine- dependent metabolism is a causative factor for the development of microvesicular hepatic steatosis. A deficiency of adenosine kinase, the major adenosine- removing enzyme of postnatal liver, was expected to affect liver function on 3 levels: availability of adenine nucleotides; disruption of the futile cycle between AMP and adenosine; and maintenance of transmethylation reactions. In homozygous Adk - /- mice, generated through Adk- targeting, embryonic stem cells developed normally during embryogenesis. However, within 4 days after birth they displayed microvesicular

hepatic steatosis and died within 14 days with fatty liver. Adenine nucleotides were decreased and S- adenosylhomocysteine, a potent inhibitor of transmethylation reactions, was increased in the mutant liver.

[18888] It is appreciated that the abovementioned animal model for ADK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[18889] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18890] McNally, T.; Helfrich, R. J.; Cowart, M.; Dorwin, S. A.; Meuth, J. L.; Idler, K. B.; Klute, K. A.; Simmer, R. L.; Kowaluk, E. A.; Halbert, D. N. : Cloning and expression of the adenosine kinase gene from rat and human tissues. Biochem. Biophys. Res. Commun. 231: 645- 650, 1997. ; and

[18891] Boison, D.; Scheurer, L.; Zumsteg, V.; Rulicke, T.; Litynski, P.; Fowler, B.; Brandner, S.; Mohler, H. : Neonatal hepatic steatosis by disruption of the adenosine kinase gene. Proc. Nat.

[18892] Further studies establishing the function and utilities of ADK are found in John Hopkins OMIM database record ID

102750, and in cited publications listed in Table 5, which are hereby incorporated by reference.Aminomethyltransferase (glycine cleavage system protein t) (AMT, Accession NP_000472.1) is another GAM116 target gene, herein designated TARGET GENE. AMT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AMT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMT BINDING SITE, designated SEQ ID:16729, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18893] Another function of GAM116 is therefore inhibition of Aminomethyltransferase (glycine cleavage system protein t) (AMT, Accession NP_000472.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMT.

[18894] ANAPC1 (Accession NP_073153.1) is another GAM116 target gene, herein designated TARGET GENE. ANAPC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ANAPC1, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANAPC1 BINDING SITE, designated SEQ ID:14212, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18895] Another function of GAM116 is therefore inhibition of ANAPC1 (Accession NP_073153.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANAPC1.

[18896] Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_009178.2) is another GAM116 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:1791, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18897] Another function of GAM116 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession

NP_009178.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[18898] Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542117.1) is another GAM116 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:1791, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18899] Another function of GAM116 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542117.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[18900] Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_127462.1) is another GAM116 target gene, herein designated TARGET GENE. ARHGEF4 BINDING SITE is a target binding site found in the 5` untranslated re-

gion of multiple transcripts of mRNA encoded by ARHGEF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF4 BINDING SITE, designated SEQ ID:12767, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18901] Another function of GAM116 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_127462.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF4.

[18902] Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_056135.2) is another GAM116 target gene, herein designated TARGET GENE. ARHGEF4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ARHGEF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF4 BINDING SITE, designated SEQ ID:12767, to the nucleotide sequence of GAM116

RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18903] Another function of GAM116 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_056135.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF4.

[18904] Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2, Accession NP_055677.1) is another GAM116 target gene, herein designated TARGET GENE. ARNT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:6462, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18905] Another function of GAM116 is therefore inhibition of Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2, Accession NP_055677.1), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of GAM116 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ARNT2.

[18906] The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.ARP5 (Accession NP_114123.2) is another GAM116 target gene, herein designated TARGET GENE. ARP5 BINDING SITE1 and ARP5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ARP5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARP5 BINDING SITE1 and ARP5 BINDING SITE2, designated SEQ ID:6833 and SEQ ID:5338 respectively, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18907] Another function of GAM116 is therefore inhibition of ARP5 (Accession NP_114123.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARP5.

[18908] ATP6V1A (Accession NP_001681.2) is another GAM116 target gene, herein designated TARGET GENE. ATP6V1A BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by ATP6V1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V1A BINDING SITE, designated SEQ ID:6211, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18909] Another function of GAM116 is therefore inhibition of ATP6V1A (Accession NP_001681.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1A.

[18910] Attractin (ATRN, Accession NP_647537.1) is another GAM116 target gene, herein designated TARGET GENE. ATRN BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATRN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:8323, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18911] Another function of GAM116 is therefore inhibition of At-

tractin (ATRN, Accession NP_647537.1), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN.

[18912] The function of ATRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 3 (B4GALT3, Accession NP_003770.1) is another GAM116 target gene, herein designated TARGET GENE. B4GALT3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B4GALT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B4GALT3 BINDING SITE, designated SEQ ID:13333, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18913] Another function of GAM116 is therefore inhibition of Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 3 (B4GALT3, Accession NP_003770.1) . Ac-

cordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT3.

[18914] Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 4 (B4GALT4, Accession NP_003769.1) is another GAM116 target gene, herein designated TARGET GENE. B4GALT4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by B4GALT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B4GALT4 BINDING SITE, designated SEQ ID:5385, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18915] Another function of GAM116 is therefore inhibition of Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 4 (B4GALT4, Accession NP_003769.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4.

[18916] B-cell cll/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NP_620309.1) is another GAM116 target gene, herein designated TARGET GENE. BCL6 BINDING SITE is a

target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:14159, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18917] Another function of GAM116 is therefore inhibition of B-cell cll/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NP_620309.1), a gene which is involved in the generation and maintenance of both T and B cells during immune responses and therefore may be associated with B-cell non- hodgkin lymphoma, diffuse large cell lymphomas and follicular lymphomas. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of B- cell non- hodgkin lymphoma, diffuse large cell lymphomas and follicular lymphomas, and of other diseases and clinical conditions associated with BCL6.

[18918] The function of BCL6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM90.1.B-cell cll/lymphoma 6 (zinc finger protein 51)

(BCL6, Accession NP_001697.2) is another GAM116 target gene, herein designated TARGET GENE. BCL6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:14159, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18919] Another function of GAM116 is therefore inhibition of B-cell cll/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NP_001697.2), a gene which is involved in the generation and maintenance of both T and B cells during immune responses and therefore may be associated with B-cell non- hodgkin lymphoma, diffuse large cell lymphomas and follicular lymphomas. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of B- cell non- hodgkin lymphoma, diffuse large cell lymphomas and follicular lymphomas, and of other diseases and clinical conditions associated with BCL6.

[18920] The function of BCL6 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM90.1.B lymphoma mo-mlv insertion region (mouse) (BMI1, Accession NP_005171.4) is another GAM116 target gene, herein designated TARGET GENE. BMI1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BMI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMI1 BINDING SITE, designated SEQ ID:5333, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18921] Another function of GAM116 is therefore inhibition of B lymphoma mo-mlv insertion region (mouse) (BMI1, Accession NP_005171.4) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMI1.

[18922] Btg family, member 2 (BTG2, Accession NP_006754.1) is another GAM116 target gene, herein designated TARGET GENE. BTG2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BTG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:8685, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18923] Another function of GAM116 is therefore inhibition of Btg family, member 2 (BTG2, Accession NP_006754.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2.

[18924] C16orf5 (Accession NP_037531.1) is another GAM116 target gene, herein designated TARGET GENE. C16orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C16orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:20128, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18925] Another function of GAM116 is therefore inhibition of C16orf5 (Accession NP_037531.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

C16orf5.

[18926] Chromosome 1 open reading frame 9 (C1orf9, Accession NP_055098.1) is another GAM116 target gene, herein designated TARGET GENE. C1orf9 BINDING SITE1 and C1orf9 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by C1orf9, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf9 BINDING SITE1 and C1orf9 BINDING SITE2, designated SEQ ID:15293 and SEQ ID:17492 respectively, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18927] Another function of GAM116 is therefore inhibition of Chromosome 1 open reading frame 9 (C1orf9, Accession NP_055098.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf9.

[18928] Chromosome 1 open reading frame 9 (C1orf9, Accession NP_057311.1) is another GAM116 target gene, herein designated TARGET GENE. C1orf9 BINDING SITE1 and C1orf9 BINDING SITE2 are target binding sites found in

untranslated regions of multiple transcripts of mRNA encoded by C1orf9, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf9 BINDING SITE1 and C1orf9 BINDING SITE2, designated SEQ ID:15293 and SEQ ID:15419 respectively, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18929] Another function of GAM116 is therefore inhibition of Chromosome 1 open reading frame 9 (C1orf9, Accession NP_057311.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf9.

[18930] Chromosome 21 open reading frame 108 (C21orf108, Accession XP_114191.2) is another GAM116 target gene, herein designated TARGET GENE. C21orf108 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf108, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:19399, to the nucleotide

sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18931] Another function of GAM116 is therefore inhibition of Chromosome 21 open reading frame 108 (C21orf108, Accession XP_114191.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108.

[18932] C5orf13 (Accession NP_004763.1) is another GAM116 target gene, herein designated TARGET GENE. C5orf13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C5orf13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf13 BINDING SITE, designated SEQ ID:900, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18933] Another function of GAM116 is therefore inhibition of C5orf13 (Accession NP_004763.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf13.

[18934] CABIN1 (Accession NP_036427.1) is another GAM116 tar-

get gene, herein designated TARGET GENE. CABIN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CABIN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CABIN1 BINDING SITE, designated SEQ ID:16423, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18935] Another function of GAM116 is therefore inhibition of CABIN1 (Accession NP_036427.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABIN1.

[18936] Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203521.1) is another GAM116 target gene, herein designated TARGET GENE. CASP8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:10011, to the nucleotide sequence of GAM116 RNA, herein designated

GAM RNA, also designated SEQ ID:301.

[18937] Another function of GAM116 is therefore inhibition of Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203521.1), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor- induced apoptosis. and therefore may be associated with Huntington- related neurodegenerative diseases. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Huntington- related neurodegenerative diseases, and of other diseases and clinical conditions associated with CASP8.

[18938] The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Cyclin d1 (prad1: parathyroid adenomatosis 1) (CCND1, Accession NP_444284.1) is another GAM116 target gene, herein designated TARGET GENE. CCND1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCND1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

CCND1 BINDING SITE, designated SEQ ID:6838, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18939] Another function of GAM116 is therefore inhibition of Cyclin d1 (prad1: parathyroid adenomatosis 1) (CCND1, Accession NP_444284.1), a gene which is involved in the control of cell cycle and is required for Schwann cell proliferation to proceed normally during Wallerian degeneration. and therefore may be associated with T(11q13)-bearing b- lymphoid and lymphoid tumors . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of T(11q13)- bearing b- lymphoid and lymphoid tumors ., and of other diseases and clinical conditions associated with CCND1.

[18940] The function of CCND1 has been established by previous studies. Tsujimoto et al. (1984) cloned the chromosomal breakpoint of chronic lymphocytic leukemia (CLL; OMIM Ref. No. 151400) cells of the B- cell type carrying t(11;14)(q13;q32). The breakpoint was in the joining segment of the heavy chain locus on chromosome 14. A probe that is specific for chromosome 11 and maps immediately 5- prime to the breakpoint on 14q+ was isolated. The probe detected a rearrangement of the homol-

ogous genomic DNA segment in CLL cells and in DNA from a diffuse large cell lymphoma with the t(11;14) translocation. This rearranged DNA segment was not present in Burkitt lymphoma cells with the t(8;14) translocation or in nonneoplastic human lymphoblastoid cells. The probe thus can be used to identify and characterize a gene located on 11q13 involved in the malignant transformation of B cells in the t(11;14) translocation. Tsujimoto et al. (1984) referred to this gene as BCL1. In 2 different cases of B- cell chronic lymphatic leukemia, Tsujimoto et al. (1985) found that the breakpoints on chromosome 11 were within 8 nucleotides of each other and on chromosome 14 involved the J4 DNA segment of the Ig heavy chain segment. Because they detected a 7mer-9mer signallike sequence with a 12- base- long spacer on the normal chromosome 11, close to the breakpoint, they speculated that the t(11;14) chromosome translocation in CLL may be sequence specific and may involve the recombination system for immunoglobulin V- D- J gene segment joining.

[18941] Animal model experiments lend further support to the function of CCND1. Ma et al. (1998) studied cyclin D1-deficient mice, which have small eyes with thin retinas,

and observed that there was a lower level of retinal cell proliferation and a unique pattern of photoreceptor cell death. Death was first observed in scattered clusters of cells in the retina. It then appeared to spread from these few cells to nearby photoreceptors, eventually producing extensive holes in the photoreceptor layer. These holes appeared to be filled with interneurons from the inner nuclear layer. The death occurred mainly during the second to fourth postnatal weeks. Other models of photoreceptor degeneration in rodents differed in that they occur more uniformly across the retina, with death proceeding over a longer period of time until all, or nearly all, of the photoreceptors degenerate. Ma et al. (1998) found that expression of a bcl2 transgene could not prevent the death.

[18942] It is appreciated that the abovementioned animal model for CCND1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[18943] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18944] Ma, C.; Papermaster, D.; Cepko, C. L. : A unique pattern of photoreceptor degeneration in cyclin D1 mutant mice.

Proc. Nat. Acad. Sci. 95: 9938- 9943, 1998. ; and

[18945] Tsujimoto, Y.; Yunis, J.; Onorato- Showe, L.; Erikson, J.; Nowell, P. C.; Croce, C. M. : Molecular cloning of the chromosomal breakpoint of B- cell lymphomas and leukemias with the t(11;1.

[18946] Further studies establishing the function and utilities of CCND1 are found in John Hopkins OMIM database record ID 168461, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cerebellar degeneration-related protein 2, 62kda (CDR2, Accession XP_071866.2) is another GAM116 target gene, herein designated TARGET GENE. CDR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDR2 BINDING SITE, designated SEQ ID:5603, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18947] Another function of GAM116 is therefore inhibition of Cerebellar degeneration-related protein 2, 62kda (CDR2, Accession XP_071866.2), a gene which plays a role in cytokinesis, cell shape, and functions such as secretion and

capping. and therefore may be associated with Paraneoplastic cerebellar degeneration. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Paraneoplastic cerebellar degeneration, and of other diseases and clinical conditions associated with CDR2.

[18948] The function of CDR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM42.1.Centaurin, delta 1 (CENTD1, Accession NP_056045.2) is another GAM116 target gene, herein designated TARGET GENE. CENTD1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CENTD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE, designated SEQ ID:10052, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18949] Another function of GAM116 is therefore inhibition of Centaurin, delta 1 (CENTD1, Accession NP_056045.2), a gene which is nvolved in cell signaling/communication. Accordingly, utilities of GAM116 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with CENTD1.

[18950] The function of CENTD1 has been established by previous studies. By screening brain cDNAs for the potential to encode proteins that are at least 50 kD, Nagase et al. (1998) identified a partial cDNA encoding CENTD1, which they called KIAA0580. The protein was predicted to be involved in cell signaling/communication. RT- PCR analysis detected expression of KIAA0580 in all tissues tested except skeletal muscle. By searching sequence databases, followed by 5- prime RACE, Miura et al. (2002) obtained full-length cDNAs encoding CENTD1 and CENTD2 (OMIM Ref. No. 606646), which they called ARAP2 and ARAP1, respectively. Like ARAP1, the 1,704- amino acid ARAP2 protein contains ARF- GAP (see OMIM Ref. No. 103180), RHO- GAP (see OMIM Ref. No. 602732), ankyrin repeat (see OMIM Ref. No. 605787), RAS (OMIM Ref. No. 190020)- associating, and 5 pleckstrin (OMIM Ref. No. 173570) homology (PH) domains. However, unlike ARAP1, ARAP2 also has a sterile alpha motif (SAM) domain like that found in EphA receptor (see OMIM Ref. No. 179610) and a region of homology to the switch- 2 domain of RAB13 (OMIM Ref. No. 602672). The RHO- GAP domain of

ARAP2 lacks the predicted catalytic arginine and is therefore unlikely to have RHO- GAP activity. Northern blot analysis showed that ARAP2 is much more variably expressed than ARAP1. The highest ARAP2 expression levels were in brain, thymus, spleen, kidney, peripheral blood leukocytes, lymph node, spinal cord, and thyroid. Two messages at 7.5 and 11 kb were found in brain, and 7.5- and 8.5- kb messages were found in thymus, spleen, kidney, peripheral blood leukocytes, and lymph node. Of the hematopoietic tissues examined, only bone marrow did not show ARAP2 expression.

[18951]

[18952] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18953] Miura, K.; Jacques, K. M.; Stauffer, S.; Kubosaki, A.; Zhu, K.; Hirsch, D. S.; Resau, J.; Zheng, Y.; Randazzo, P. A. : ARAP1: a point of convergence for Arf and Rho signaling. Molec. Cell 9: 109- 119, 2002. ; and

[18954] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 10.

[18955] Further studies establishing the function and utilities of CENTD1 are found in John Hopkins OMIM database record ID 606645, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromodomain helicase dna binding protein 3 (CHD3, Accession NP_001263.1) is another GAM116 target gene, herein designated TARGET GENE. CHD3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHD3 BINDING SITE, designated SEQ ID:773, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18956] Another function of GAM116 is therefore inhibition of Chromodomain helicase dna binding protein 3 (CHD3, Accession NP_001263.1), a gene which may regulate gene expression and chromatin structure. and therefore may be associated with Dermatomyositis . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Dermatomyositis ., and of other diseases and clinical conditions associated with CHD3.

[18957] The function of CHD3 has been established by previous studies. Anti- Mi2 autoantibody is strongly associated with dermatomyositis and is found in sera of 20% of dermatomyositis patients. Mi2 antigen consists of at least 8 components. By immunoscreening human thymocyte and HeLa cell cDNA expression libraries with anti- Mi2 patient sera, Ge et al. (1995) isolated a partial cDNA encoding Mi2- alpha, or CHD3. The deduced partial protein contains 4 potential zinc finger domains. Antibodies against recombinant Mi2- alpha reacted with a 240- kD HeLa cell protein. Northern blot analysis detected a single 7.5- to 8.0- kb Mi2- alpha transcript in HeLa cells. Seelig et al. (1996) noted that the Mi2- alpha and Mi2- beta (CHD4; 603277) proteins react with most or all dermatomyositis patient anti- Mi2 sera. While these proteins are distinct, they have stretches of identical sequence that could result in shared epitopes.

[18958]

[18959] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18960] Ge, Q.; Nilasena, D. S.; O'Brien, C. A.; Frank, M. B.; Targoff, I. N. : Molecular analysis of a major antigenic region of the

240- kD protein of Mi- 2 autoantigen. J. Clin. Invest. 96: 1730- 1737, 1995. ; and

[18961] Seelig, H. P.; Renz, M.; Targoff, I. N.; Ge, Q.; Frank, M. B. : Two forms of the major antigenic protein of the dermato-myositis- specific Mi- 2 autoantigen. (Letter) Arthritis Rheum. 39:.

[18962] Further studies establishing the function and utilities of CHD3 are found in John Hopkins OMIM database record ID 602120, and in cited publications listed in Table 5, which are hereby incorporated by reference.CIDE-3 (Accession NP_071377.2) is another GAM116 target gene, herein designated TARGET GENE. CIDE-3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CIDE-3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIDE-3 BINDING SITE, designated SEQ ID:19483, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18963] Another function of GAM116 is therefore inhibition of CIDE-3 (Accession NP_071377.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with CIDE-3.

[18964] Collagen, type x, alpha 1(schmid metaphyseal chondrodysplasia) (COL10A1, Accession NP_000484.2) is another GAM116 target gene, herein designated TARGET GENE. COL10A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL10A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL10A1 BINDING SITE, designated SEQ ID:5855, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18965] Another function of GAM116 is therefore inhibition of Collagen, type x, alpha 1(schmid metaphyseal chondrodysplasia) (COL10A1, Accession NP_000484.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL10A1.

[18966] Collagen, type xi, alpha 2 (COL11A2, Accession NP_542411.1) is another GAM116 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COL11A2, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:14857, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18967] Another function of GAM116 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession NP_542411.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[18968] Collagen, type xi, alpha 2 (COL11A2, Accession NP_542412.1) is another GAM116 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:14857, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18969] Another function of GAM116 is therefore inhibition of

Collagen, type xi, alpha 2 (COL11A2, Accession NP_542412.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[18970] Collagen, type xi, alpha 2 (COL11A2, Accession NP_542410.1) is another GAM116 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:14857, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18971] Another function of GAM116 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession NP_542410.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[18972] Collagen, type xxi, alpha 1 (COL21A1, Accession NP_110447.2) is another GAM116 target gene, herein designated TARGET GENE. COL21A1 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by COL21A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL21A1 BINDING SITE, designated SEQ ID:7623, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18973] Another function of GAM116 is therefore inhibition of Collagen, type xxi, alpha 1 (COL21A1, Accession NP_110447.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL21A1.

[18974] Complexin 1 (CPLX1, Accession NP_006642.1) is another GAM116 target gene, herein designated TARGET GENE. CPLX1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CPLX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:3486, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18975] Another function of GAM116 is therefore inhibition of Complexin 1 (CPLX1, Accession NP_006642.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1.

[18976] Cytochrome p450, subfamily i (dioxin-inducible), polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NP_000095.1) is another GAM116 target gene, herein designated TARGET GENE. CYP1B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP1B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP1B1 BINDING SITE, designated SEQ ID:11514, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18977] Another function of GAM116 is therefore inhibition of Cytochrome p450, subfamily i (dioxin-inducible), polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NP_000095.1), a gene which participates in the metabolism of a molecule that is a participant in eye development. and therefore is associated with Glaucoma,

primary congenital, peters anomaly . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Glaucoma, primary congenital, peters anomaly ., and of other diseases and clinical conditions associated with CYP1B1.

[18978] The function of CYP1B1 has been established by previous studies. In the study of candidate genes identified in the critical region of 2p21 where a major gene for primary congenital glaucoma, GLC3A (OMIM Ref. No. 231300), had been mapped by linkage studies, Stoilov et al. (1997) found the CYP1B1 gene, which had previously been identified by Sutter et al. (1994). From a determination of the intron/exon junctions of this gene, Stoilov et al. (1997) concluded that the gene contains 3 exons and 2 introns. The entire coding sequence of the genes is contained in exons 2 and 3. This genomic structure agreed with that reported by Tang et al. (1996). Screening for the presence of coding sequence changes in the CYP1B1 gene, Stoilov et al. (1997) identified 3 different truncating mutations: a 13- bp deletion found in 1 consanguineous and 1 non-consanguineous family (601771.0001); a single cytosine insertion observed in another 2 consanguineous families (601771.0002); and a large deletion found in an addi-

tional consanguineous family. In addition, a G- to- C transversion at nucleotide 1640 of the CYP1B1 coding sequence was found that caused a val432- to- leu amino acid substitution. This change created an EcoR57 restriction site, thus providing a rapid screening method. Heterozygosity for the val432- to- leu change was found in 51.4% of 70 normal individuals. This amino acid change was not in that part of CYP1B1 that represented conserved sequences, and both valine and leucine are neutral and hydrophobic. Their very similar aliphatic side groups differ by a single - CH2 group. Therefore, this change appeared to represent a common amino acid polymorphism that is not related to the primary congenital glaucoma phenotype. Identification of CYP1B1 as the gene affected in primary congenital glaucoma was said by Stoilov et al. (1997) to be the first example in which mutations in a member of the cytochrome P450 superfamily results in a primary developmental defect. The finding was not unexpected, however, as a link between members of this superfamily and the processes of growth and differentiation had been postulated previously. They speculated that CYP1B1 participates in the metabolism of an as- yet- unknown biologically active molecule that is a participant in eye devel-

opment. Stoilov et al. (1997) demonstrated that a stable protein product is produced in the affected subjects of these families, and that the 3 mutations they described would be expected to result in a product lacking between 189 and 254 amino acids from the C terminus. This segment harbors the invariant cysteine of all known cytochrome P450 amino sequences; in CYP1B1 it is cys470. Schwartzman et al. (1987) implicated a cytochrome-P450- dependent arachidonate metabolite that inhibits Na+,K+- ATPase in the cornea in regulating corneal transparency and aqueous humor secretion. This finding is consistent with the clouding of the cornea and increased intraocular pressure, the 2 major diagnostic criteria for primary congenital glaucoma.

[18979]

[18980] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18981] Bejjani, B. A.; Lewis, R. A.; Tomey, K. F.; Anderson, K. L.; Dueker, D. K.; Jabak, M.; Astle, W. F.; Otterud, B.; Leppert, M.; Lupski, J. R. : Mutations in CYP1B1, the gene for cytochrome P4501B1, are the predominant cause of primary congenital glaucoma in Saudi Arabia. Am. J. Hum. Genet.

62: 325- 333, 1998. ; and

[18982] Stoilov, I.; Akarsu, A. N.; Alozie, I.; Child, A.; Barsoum-Homsy, M.; Turacli, M. E.; Or, M.; Lewis, R. A.; Ozdemir, N.; Brice, G.; Aktan, S. G.; Chevrette, L.; Coca- Prados, M.; Sarfara.

[18983] Further studies establishing the function and utilities of CYP1B1 are found in John Hopkins OMIM database record ID 601771, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dynactin 4 (p62) (DCTN4, Accession NP_057305.1) is another GAM116 target gene, herein designated TARGET GENE. DCTN4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCTN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCTN4 BINDING SITE, designated SEQ ID:7697, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18984] Another function of GAM116 is therefore inhibition of Dynactin 4 (p62) (DCTN4, Accession NP_057305.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with DCTN4.

[18985] Disrupted in schizophrenia 1 (DISC1, Accession NP_061132.1) is another GAM116 target gene, herein designated TARGET GENE. DISC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DISC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:6142, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18986] Another function of GAM116 is therefore inhibition of Disrupted in schizophrenia 1 (DISC1, Accession NP_061132.1), a gene which has globular N- terminal domain(s) and a helical C- terminal domain. and therefore may be associated with Schizophrenia . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Schizophrenia ., and of other diseases and clinical conditions associated with DISC1.

[18987] The function of DISC1 has been established by previous studies. Millar et al. (2000) isolated and sequenced the breakpoints on chromosomes 1 and 11 in the Scottish family carrying the translocation, and by sequence analy-

sis concluded that no genes were within the region surrounding the chromosome 11 breakpoint. The authors found that, by contrast, the corresponding region on chromosome 1 was gene- dense and that not 1, but 2, novel genes were directly disrupted by the translocation. They named these genes 'disrupted in schizophrenia' 1 and 2 (DISC1 and DISC2, 606271). The major DISC1 transcript is approximately 7.5 kb, contains an open reading frame encoding 854 amino acids, and is ubiquitously expressed. The protein is predicted to consist of a globular N- terminal domain(s) and helical C- terminal domain that has the potential to form a coiled- coil by interaction with another protein(s). Similar structures are thought to be present in a variety of unrelated proteins that are known to function in the nervous system. The putative structure of the protein encoded by DISC1 is therefore compatible with a role in the nervous system. DISC2 apparently specifies a single exon thought to be a noncoding RNA molecule that is antisense to DISC1, an arrangement that has been observed at other loci where the antisense RNA may regulate expression of the sense gene. The authors concluded that DISC1 and DISC2 should be considered formal candidate genes for susceptibility to psychiatric ill-

ness. The family studied by St. Clair et al. (1990) and Millar et al. (2000) was originally ascertained by Jacobs et al. (1970), who reported the translocation in the propositus, who had adolescent conduct disorder, and in members of 4 generations of the extended family. Blackwood et al. (2001) provided a follow- up. Of the 87 members of the family who were karyotyped, 37 carried the translocation. A psychiatric diagnosis was reached in 29 carriers, 38 noncarriers, and the 2 founders (who were not karyotyped). The range of symptoms in this family crossed traditional diagnostic boundaries, and the locus identified by the breakpoint on 1q42 appeared to be implicated in either schizophrenia or bipolar disorder. Furthermore, Blackwood (2000) reported abnormalities in the auditory P300 event- related potential, which showed prolonged latency and reduced amplitude in affected members of the family.

[18988]

[18989] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18990] Blackwood, D. H. R.; Fordyce, A.; Walker, M. T.; St. Clair, D. M.; Porteous, D. J.; Muir, W. J. : Schizophrenia and af-

fective disorders- - cosegretation with a translocation at chromosome 1q42 that directly disrupts brain- expressed genes: clinical and P300 findings in a family. Am. J. Hum. Genet. 69: 428- 433, 2001. ; and

[18991] Ekelund, J.; Hovatta, I.; Parker, A.; Paunio, T.; Varilo, T.; Martin, R.; Suhonen, J.; Ellonen, P.; Chan, G.; Sinsheimer, J. S.; Sobel, E.; Juvonen, H.; Arajarvi, R.; Partonen, T.; Suv.

[18992] Further studies establishing the function and utilities of DISC1 are found in John Hopkins OMIM database record ID 605210, and in cited publications listed in Table 5, which are hereby incorporated by reference.DKFZP434J046 (Accession NP_056486.1) is another GAM116 target gene, herein designated TARGET GENE. DKFZP434J046 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434J046, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434J046 BINDING SITE, designated SEQ ID:4305, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18993] Another function of GAM116 is therefore inhibition of DKFZP434J046 (Accession NP_056486.1) . Accordingly, utili-

ties of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J046.

[18994] DKFZP564K0822 (Accession NP_110423.2) is another GAM116 target gene, herein designated TARGET GENE. DKFZP564K0822 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K0822, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564K0822 BINDING SITE, designated SEQ ID:8390, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18995] Another function of GAM116 is therefore inhibition of DKFZP564K0822 (Accession NP_110423.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K0822.

[18996] DKFZp761B128 (Accession NP_689650.1) is another GAM116 target gene, herein designated TARGET GENE. DKFZp761B128 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by

DKFZp761B128, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B128 BINDING SITE, designated SEQ ID:19522, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18997] Another function of GAM116 is therefore inhibition of DKFZp761B128 (Accession NP_689650.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B128.

[18998] DKFZp761G0122 (Accession NP_689874.1) is another GAM116 target gene, herein designated TARGET GENE. DKFZp761G0122 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761G0122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761G0122 BINDING SITE, designated SEQ ID:9943, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[18999] Another function of GAM116 is therefore inhibition of DKFZp761G0122 (Accession NP_689874.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0122.

[19000] Dickkopf homolog 2 (xenopus laevis) (DKK2, Accession NP_055236.1) is another GAM116 target gene, herein designated TARGET GENE. DKK2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKK2 BINDING SITE, designated SEQ ID:10328, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19001] Another function of GAM116 is therefore inhibition of Dickkopf homolog 2 (xenopus laevis) (DKK2, Accession NP_055236.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK2.

[19002] Dihydrolipoamide s-acetyltransferase (e2 component of pyruvate dehydrogenase complex) (DLAT, Accession

NP_001922.2) is another GAM116 target gene, herein designated TARGET GENE. DLAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DLAT BINDING SITE, designated SEQ ID:16982, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19003] Another function of GAM116 is therefore inhibition of Dihydrolipoamide s-acetyltransferase (e2 component of pyruvate dehydrogenase complex) (DLAT, Accession NP_001922.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLAT.

[19004] DOT1L (Accession NP_115871.1) is another GAM116 target gene, herein designated TARGET GENE. DOT1L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DOT1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DOT1L

BINDING SITE, designated SEQ ID:5058, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19005] Another function of GAM116 is therefore inhibition of DOT1L (Accession NP_115871.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOT1L.

[19006] DRIL2 (Accession NP_006456.1) is another GAM116 target gene, herein designated TARGET GENE. DRIL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DRIL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:4242, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19007] Another function of GAM116 is therefore inhibition of DRIL2 (Accession NP_006456.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2.

[19008] Down syndrome critical region gene 3 (DSCR3, Accession NP_006043.1) is another GAM116 target gene, herein

designated TARGET GENE. DSCR3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSCR3 BINDING SITE, designated SEQ ID:16394, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19009] Another function of GAM116 is therefore inhibition of Down syndrome critical region gene 3 (DSCR3, Accession NP_006043.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR3.

[19010] Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_742055.1) is another GAM116 target gene, herein designated TARGET GENE. EYA1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EYA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA1 BINDING SITE, designated SEQ ID:8370, to the nucleotide

sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19011] Another function of GAM116 is therefore inhibition of Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_742055.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA1.

[19012] Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_000494.2) is another GAM116 target gene, herein designated TARGET GENE. EYA1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EYA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA1 BINDING SITE, designated SEQ ID:8370, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19013] Another function of GAM116 is therefore inhibition of Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_000494.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA1.

[19014] Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_742057.1) is another GAM116 target gene, herein designated TARGET GENE. EYA1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EYA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA1 BINDING SITE, designated SEQ ID:8370, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19015] Another function of GAM116 is therefore inhibition of Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_742057.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA1.

[19016] Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_742056.1) is another GAM116 target gene, herein designated TARGET GENE. EYA1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EYA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of EYA1 BINDING SITE, designated SEQ ID:8370, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19017] Another function of GAM116 is therefore inhibition of Eyes absent homolog 1 (drosophila) (EYA1, Accession NP_742056.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA1.

[19018] Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NP_003941.1) is another GAM116 target gene, herein designated TARGET GENE. F2RL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F2RL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:4749, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19019] Another function of GAM116 is therefore inhibition of Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NP_003941.1), a gene which Protease- activated

receptor 4; G protein- coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3.

[19020] The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.F-box only protein 7 (FBXO7, Accession NP_036311.2) is another GAM116 target gene, herein designated TARGET GENE. FBXO7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FBXO7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXO7 BINDING SITE, designated SEQ ID:10093, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19021] Another function of GAM116 is therefore inhibition of F-box only protein 7 (FBXO7, Accession NP_036311.2), a gene which Fubunit of the SCF ubiquitin protein ligase complex, recruits substrates to ubiquitin conjugating enzymes. Accordingly, utilities of GAM116 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with FBXO7.

[19022] The function of FBXO7 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40- amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F- box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134), F- box proteins), which function in phosphorylation- dependent ubiquitination. Using a yeast 2- hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F- box proteins, respectively. These contained C termini with leucine- rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Using RT- PCR analysis, Winston et al. (1999) found high expression of FBXO7 in brain, heart, kidney, liver, lung, skeletal muscle, and placenta, with lower levels in pancreas.

[19023]

[19024] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[19025] Ilyin, G. P.; Rialland, M.; Pigeon, C.; Guguen- Guillouzo, C. : cDNA cloning and expression analysis of new members of the mammalian F- box protein family. Genomics 67: 40- 47, 2000. ; and

[19026] Winston, J. T.; Koepp, D. M.; Zhu, C.; Elledge, S. J.; Harper, J. W. : A family of mammalian F- box proteins. Curr. Biol. 9: 1180- 1182, 1999.

[19027] Further studies establishing the function and utilities of FBXO7 are found in John Hopkins OMIM database record ID 605648, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10035 (Accession NP_060444.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ10035 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ10035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10035 BINDING SITE, designated SEQ ID:12536, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ

ID:301.

[19028] Another function of GAM116 is therefore inhibition of FLJ10035 (Accession NP_060444.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10035.

[19029] FLJ11149 (Accession NP_060809.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ11149 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11149 BINDING SITE, designated SEQ ID:14300, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19030] Another function of GAM116 is therefore inhibition of FLJ11149 (Accession NP_060809.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11149.

[19031] FLJ11155 (Accession NP_060812.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ11155

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11155, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11155 BINDING SITE, designated SEQ ID:8506, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19032] Another function of GAM116 is therefore inhibition of FLJ11155 (Accession NP_060812.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11155.

[19033] FLJ11274 (Accession NP_060845.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ11274 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ11274, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:7491, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19034] Another function of GAM116 is therefore inhibition of FLJ11274 (Accession NP_060845.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274.

[19035] FLJ11800 (Accession NP_079250.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ11800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11800 BINDING SITE, designated SEQ ID:11823, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19036] Another function of GAM116 is therefore inhibition of FLJ11800 (Accession NP_079250.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11800.

[19037] FLJ12190 (Accession NP_079347.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ12190 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ12190, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12190 BINDING SITE, designated SEQ ID:15397, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19038] Another function of GAM116 is therefore inhibition of FLJ12190 (Accession NP_079347.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12190.

[19039] FLJ12443 (Accession NP_079106.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ12443 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12443 BINDING SITE, designated SEQ ID:19826, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19040] Another function of GAM116 is therefore inhibition of

FLJ12443 (Accession NP_079106.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12443.

[19041] FLJ12586 (Accession NP_078896.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ12586 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12586, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12586 BINDING SITE, designated SEQ ID:2047, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19042] Another function of GAM116 is therefore inhibition of FLJ12586 (Accession NP_078896.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12586.

[19043] FLJ12650 (Accession NP_078798.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ12650 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12650, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12650 BINDING SITE, designated SEQ ID:2476, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19044] Another function of GAM116 is therefore inhibition of FLJ12650 (Accession NP_078798.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12650.

[19045] FLJ12800 (Accession NP_075054.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ12800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:1109, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19046] Another function of GAM116 is therefore inhibition of FLJ12800 (Accession NP_075054.1) . Accordingly, utilities

of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800.

[19047] FLJ13204 (Accession NP_079037.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ13204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:13933, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19048] Another function of GAM116 is therefore inhibition of FLJ13204 (Accession NP_079037.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204.

[19049] FLJ13855 (Accession NP_075567.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ13855 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ13855, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13855 BINDING SITE, designated SEQ ID:18367, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19050] Another function of GAM116 is therefore inhibition of FLJ13855 (Accession NP_075567.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13855.

[19051] FLJ14082 (Accession NP_079300.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ14082 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14082, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:15997, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19052] Another function of GAM116 is therefore inhibition of FLJ14082 (Accession NP_079300.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14082.

[19053] FLJ14564 (Accession NP_115939.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ14564 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14564, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14564 BINDING SITE, designated SEQ ID:8020, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19054] Another function of GAM116 is therefore inhibition of FLJ14564 (Accession NP_115939.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14564.

[19055] FLJ20257 (Accession NP_062552.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ20257 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ20257 BINDING SITE, designated SEQ ID:1289, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19056] Another function of GAM116 is therefore inhibition of FLJ20257 (Accession NP_062552.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20257.

[19057] FLJ20716 (Accession NP_060408.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ20716 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20716, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20716 BINDING SITE, designated SEQ ID:4364, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19058] Another function of GAM116 is therefore inhibition of FLJ20716 (Accession NP_060408.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20716.

[19059] FLJ22490 (Accession NP_079066.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ22490 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22490, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22490 BINDING SITE, designated SEQ ID:4123, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19060] Another function of GAM116 is therefore inhibition of FLJ22490 (Accession NP_079066.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22490.

[19061] FLJ22494 (Accession NP_079091.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ22494 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22494, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ22494 BINDING SITE, designated SEQ ID:11620, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19062] Another function of GAM116 is therefore inhibition of FLJ22494 (Accession NP_079091.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22494.

[19063] FLJ22944 (Accession NP_079421.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ22944 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22944, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22944 BINDING SITE, designated SEQ ID:16245, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19064] Another function of GAM116 is therefore inhibition of FLJ22944 (Accession NP_079421.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22944.

[19065] FLJ30313 (Accession NP_689970.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ30313 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30313, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30313 BINDING SITE, designated SEQ ID:956, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19066] Another function of GAM116 is therefore inhibition of FLJ30313 (Accession NP_689970.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30313.

[19067] FLJ32029 (Accession NP_775853.2) is another GAM116 target gene, herein designated TARGET GENE. FLJ32029 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32029, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32029 BINDING SITE, designated SEQ ID:16839, to the

nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19068] Another function of GAM116 is therefore inhibition of FLJ32029 (Accession NP_775853.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32029.

[19069] FLJ35838 (Accession NP_775803.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ35838 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35838, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35838 BINDING SITE, designated SEQ ID:1616, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19070] Another function of GAM116 is therefore inhibition of FLJ35838 (Accession NP_775803.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35838.

[19071] FLJ36504 (Accession NP_787106.2) is another GAM116

target gene, herein designated TARGET GENE. FLJ36504 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36504, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36504 BINDING SITE, designated SEQ ID:9901, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19072] Another function of GAM116 is therefore inhibition of FLJ36504 (Accession NP_787106.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36504.

[19073] FLJ36749 (Accession NP_775877.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ36749 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36749, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36749 BINDING SITE, designated SEQ ID:16158, to the nucleotide sequence of GAM116 RNA, herein designated

GAM RNA, also designated SEQ ID:301.

[19074] Another function of GAM116 is therefore inhibition of FLJ36749 (Accession NP_775877.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36749.

[19075] FLJ36928 (Accession NP_775822.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ36928 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36928, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36928 BINDING SITE, designated SEQ ID:12357, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19076] Another function of GAM116 is therefore inhibition of FLJ36928 (Accession NP_775822.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36928.

[19077] FLJ39106 (Accession NP_775900.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ39106

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39106 BINDING SITE, designated SEQ ID:4522, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19078] Another function of GAM116 is therefore inhibition of FLJ39106 (Accession NP_775900.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39106.

[19079] FLJ39654 (Accession NP_787110.1) is another GAM116 target gene, herein designated TARGET GENE. FLJ39654 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39654, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39654 BINDING SITE, designated SEQ ID:8884, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19080] Another function of GAM116 is therefore inhibition of FLJ39654 (Accession NP_787110.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39654.

[19081] Fibronectin leucine rich transmembrane protein 3 (FLRT3, Accession NP_037413.1) is another GAM116 target gene, herein designated TARGET GENE. FLRT3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLRT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLRT3 BINDING SITE, designated SEQ ID:3900, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19082] Another function of GAM116 is therefore inhibition of Fibronectin leucine rich transmembrane protein 3 (FLRT3, Accession NP_037413.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT3.

[19083] Forkhead box a1 (FOXA1, Accession NP_004487.2) is another GAM116 target gene, herein designated TARGET

GENE. FOXA1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FOXA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXA1 BINDING SITE, designated SEQ ID:15349, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19084] Another function of GAM116 is therefore inhibition of Forkhead box a1 (FOXA1, Accession NP_004487.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXA1.

[19085] Forkhead box m1 (FOXM1, Accession NP_068772.1) is another GAM116 target gene, herein designated TARGET GENE. FOXM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOXM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXM1 BINDING SITE, designated SEQ ID:15673, to the nucleotide sequence of GAM116

RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19086] Another function of GAM116 is therefore inhibition of Forkhead box m1 (FOXM1, Accession NP_068772.1), a gene which may play a role in the control of cell proliferation. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXM1.

[19087] The function of FOXM1 has been established by previous studies. The 'forkhead' gene family, originally identified in Drosophila, comprises transcription factors with a conserved 100- amino acid DNA- binding motif. One group of factors with the forkhead, or winged- helix, domain is the hepatocyte nuclear factor- 3 family of proteins, which appears to regulate cell- specific transcription in hepatocytes and in respiratory and intestinal epithelia. In an attempt to identify forkhead domain transcription factors involved in intestinal cell differentiation, Ye et al. (1997) isolated FKHL16, which they designated HNF3/forkhead homolog- 11 (HFH11), from a human colon carcinoma cell line. On Northern blots, FKHL16 is expressed primarily in thymus, testis, small intestine, and colon, moderately in ovary, and at reduced levels in other tissues. Ye et al.

(1997) found 2 alternatively spliced FKHL16 mRNAs, yielding predicted proteins of 801 (OMIM Ref. No. HFH11A) and 748 (OMIM Ref. No. HFH11B) amino acids. Both isoforms contain 2 PEST regions, associated with rapid protein degradation. Expression studies in mouse revealed that Fkhl16 is transcribed broadly in embryos, but is expressed only in adult organs containing proliferating cells involved in replenishing differentiated cell populations or in response to growth factors released during injury or repair. By analyzing the promoter region of human FKHL16, or TRIDENT, Korver et al. (1997) found that the 300 bp upstream of the transcription start site are essential for the cell cycle- specific expression of FKHL16. They stated that the promoter data in combination with the expression of FKHL16 in cycling, but not resting, cells indicate that this protein is likely to play a role in the control of cell proliferation. By analysis of cDNA microarrays, Ly et al. (2000) showed that diminished proliferation exhibited by fibroblasts from either elderly patients or patients with Hutchinson- Gilford progeria (OMIM Ref. No. 176670) was associated with reduced expression of cell cycle genes as well as a decline in FOXM1B (OMIM Ref. No. HFH11B) levels. Wang et al. (2001) showed that increased

levels of Foxm1b in regenerating liver of old transgenic mice restored the sharp peaks in hepatocyte DNA replication and mitosis that are the hallmarks of young regenerating mouse liver. Restoration of the young regenerating liver phenotype was associated with increased expression of numerous cell cycle regulatory genes. Cotransfection assays in the human hepatoma HepG2 cell line demonstrated that FOXM1B protein stimulated expression of both the cyclin B1 (OMIM Ref. No. 123836) and cyclin D1 (OMIM Ref. No. 168461) promoters, suggesting that these cyclin genes are a direct FOXM1B transcription target. The results suggested that FOXM1B controls the transcription network of genes that are essential for cell division and exit from mitosis. The results indicated that reduced expression of the FOXM1B transcription factor contributes to the decline in cellular proliferation observed in the aging process.

[19088]

[19089] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19090] Westendorf, J. M.; Rao, P. N.; Gerace, L. : Cloning of cDNAs for M- phase phosphoproteins recognized by the MPM2

monoclonal antibody and determination of the phosphorylated epitope. Proc. Nat. Acad. Sci. 91: 714- 718, 1994. ; and

[19091] Yao, K.- M.; Sha, M.; Lu, Z.; Wong, G. G. : Molecular analysis of a novel winged helix protein, WIN: expression pattern, DNA binding property, and alternative splicing within the DNA bin.

[19092] Further studies establishing the function and utilities of FOXM1 are found in John Hopkins OMIM database record ID 602341, and in cited publications listed in Table 5, which are hereby incorporated by reference.GALNT13 (Accession XP_054951.3) is another GAM116 target gene, herein designated TARGET GENE. GALNT13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GALNT13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALNT13 BINDING SITE, designated SEQ ID:16772, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19093] Another function of GAM116 is therefore inhibition of GALNT13 (Accession XP_054951.3) . Accordingly, utilities

of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT13.

[19094] Glucosidase, beta; acid (includes glucosylceramidase) (GBA, Accession NP_000148.1) is another GAM116 target gene, herein designated TARGET GENE. GBA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GBA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GBA BINDING SITE, designated SEQ ID:8745, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19095] Another function of GAM116 is therefore inhibition of Glucosidase, beta; acid (includes glucosylceramidase) (GBA, Accession NP_000148.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBA.

[19096] GLTP (Accession NP_057517.1) is another GAM116 target gene, herein designated TARGET GENE. GLTP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLTP, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GLTP BINDING SITE, designated SEQ ID:6571, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19097] Another function of GAM116 is therefore inhibition of GLTP (Accession NP_057517.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLTP.

[19098] GOR (Accession NP_758439.1) is another GAM116 target gene, herein designated TARGET GENE. GOR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GOR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOR BINDING SITE, designated SEQ ID:10062, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19099] Another function of GAM116 is therefore inhibition of GOR (Accession NP_758439.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GOR.

[19100] G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) is another GAM116 target gene, herein designated TARGET GENE. GPR26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR26 BINDING SITE, designated SEQ ID:8715, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19101] Another function of GAM116 is therefore inhibition of G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR26.

[19102] Huntingtin (huntington disease) (HD, Accession NP_002102.2) is another GAM116 target gene, herein designated TARGET GENE. HD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of HD BINDING SITE, designated SEQ ID:3274, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19103] Another function of GAM116 is therefore inhibition of Huntingtin (huntington disease) (HD, Accession NP_002102.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD.

[19104] Hypermethylated in cancer 2 (HIC2, Accession XP_036937.2) is another GAM116 target gene, herein designated TARGET GENE. HIC2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HIC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:16826, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19105] Another function of GAM116 is therefore inhibition of Hypermethylated in cancer 2 (HIC2, Accession XP_036937.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with HIC2.

[19106] Hypermethylated in cancer 2 (HIC2, Accession NP_055909.1) is another GAM116 target gene, herein designated TARGET GENE. HIC2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HIC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:16826, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19107] Another function of GAM116 is therefore inhibition of Hypermethylated in cancer 2 (HIC2, Accession NP_055909.1). Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2.

[19108] HSPC039 (Accession NP_057181.1) is another GAM116 target gene, herein designated TARGET GENE. HSPC039 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC039, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of HSPC039 BINDING SITE, designated SEQ ID:6893, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19109] Another function of GAM116 is therefore inhibition of HSPC039 (Accession NP_057181.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC039.

[19110] HSPC056 (Accession NP_054873.1) is another GAM116 target gene, herein designated TARGET GENE. HSPC056 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC056 BINDING SITE, designated SEQ ID:6808, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19111] Another function of GAM116 is therefore inhibition of HSPC056 (Accession NP_054873.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

HSPC056.

[19112] HT002 (Accession NP_054785.2) is another GAM116 target gene, herein designated TARGET GENE. HT002 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HT002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:13026, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19113] Another function of GAM116 is therefore inhibition of HT002 (Accession NP_054785.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002.

[19114] 5-hydroxytryptamine (serotonin) receptor 4 (HTR4, Accession NP_000861.1) is another GAM116 target gene, herein designated TARGET GENE. HTR4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE,

designated SEQ ID:2727, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19115] Another function of GAM116 is therefore inhibition of 5-hydroxytryptamine (serotonin) receptor 4 (HTR4, Accession NP_000861.1), a gene which mediates calcium channel currents. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR4.

[19116] The function of HTR4 has been established by previous studies. The 5- hydroxytryptamine- 4 receptor was first characterized by Dumuis et al. (1988) in mouse colliculi neurons. Subsequently, Eglen et al. (1995) showed that 5-HTR4 mediates widespread effects in central and peripheral nervous systems. Serotonin acts as a stimulant to atrial cardiac cells in only a few mammalian species including human, monkey, and pig but not rodents. Cells from human atrium respond to 5- HT stimulation by producing an L- type calcium current. Blondel et al. (1997) used PCR, based on primers to the central region of rat 5-HT4 receptor, to clone a human 5- HT4 receptor, which they called 5- HT4A. Sequence analysis showed that this cDNA encodes a 387- amino acid polypeptide with 7 pu-

tative transmembrane domains and several potential regulatory sites. Blondel et al. (1997) found that 5- HT4A is the same length and 93% identical to the shorter of the 2 alternately spliced forms of the rat 5- HT4 receptor. RT-PCR analysis showed that the 5- HT4A mRNA is expressed in human ileum, brain, and atrium, but not in the ventricle. COS- 7 cells expressing the 5- HT4 receptor respond to serotonin stimulation with pharmacologic profiles similar to those seen in human atrial myocytes, suggesting to Blondel et al. (1997) that 5- HT4A is the protein responsible for the serotonin responsiveness of the human atrium.

[19117]

[19118] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19119] Claeysen, S.; Faye, P.; Sebben, M.; Lemaire, S.; Bockaert, J.; Dumuis, A.; Taviaux, S. : Assignment of 5- hydroxytryptamine receptor (HTR4) to human chromosome 5 bands q31- to- q33 by in situ hybridization. Cytogenet. Cell Genet. 78: 133- 134, 1997. ; and

[19120] Dumuis, A.; Bouhelal, R.; Sebben, M.; Cory, R.; Bockaert, J. : A nonclassical 5- hydroxytryptamine receptor positively coupled with adenylate cyclase in the central nervous sys-

tem. Molec.

[19121] Further studies establishing the function and utilities of HTR4 are found in John Hopkins OMIM database record ID 602164, and in cited publications listed in Table 5, which are hereby incorporated by reference.HUMAGCGB (Accession XP_291083.2) is another GAM116 target gene, herein designated TARGET GENE. HUMAGCGB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HUMAGCGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:466, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19122] Another function of GAM116 is therefore inhibition of HUMAGCGB (Accession XP_291083.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB.

[19123] HUMAGCGB (Accession NP_037418.2) is another GAM116 target gene, herein designated TARGET GENE. HUMAGCGB

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HUMAGCGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:466, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19124] Another function of GAM116 is therefore inhibition of HUMAGCGB (Accession NP_037418.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB.

[19125] ICK (Accession NP_057597.2) is another GAM116 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:20049, to the nucleotide sequence of GAM116 RNA, herein designated

GAM RNA, also designated SEQ ID:301.

[19126] Another function of GAM116 is therefore inhibition of ICK (Accession NP_057597.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[19127] ICK (Accession NP_766629.1) is another GAM116 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:20049, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19128] Another function of GAM116 is therefore inhibition of ICK (Accession NP_766629.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[19129] ICK (Accession NP_055735.1) is another GAM116 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ICK, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:20049, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19130] Another function of GAM116 is therefore inhibition of ICK (Accession NP_055735.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[19131] Interleukin 6 receptor (IL6R, Accession NP_852004.1) is another GAM116 target gene, herein designated TARGET GENE. IL6R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL6R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL6R BINDING SITE, designated SEQ ID:12823, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19132] Another function of GAM116 is therefore inhibition of Interleukin 6 receptor (IL6R, Accession NP_852004.1), a

gene which is essential to the regulation of the immune response, hematopoiesis, and acute- phase reactions. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL6R.

[19133] The function of IL6R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Interleukin 6 receptor (IL6R, Accession NP_000556.1) is another GAM116 target gene, herein designated TARGET GENE. IL6R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL6R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL6R BINDING SITE, designated SEQ ID:12823, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19134] Another function of GAM116 is therefore inhibition of Interleukin 6 receptor (IL6R, Accession NP_000556.1), a gene which is essential to the regulation of the immune response, hematopoiesis, and acute- phase reactions. Ac-

cordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL6R.

[19135] The function of IL6R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Insulin receptor (INSR, Accession NP_000199.1) is another GAM116 target gene, herein designated TARGET GENE. INSR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INSR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INSR BINDING SITE, designated SEQ ID:8240, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19136] Another function of GAM116 is therefore inhibition of Insulin receptor (INSR, Accession NP_000199.1), a gene which binds insulin and has a tyrosine- protein kinase activity. and therefore is associated with Various forms of insulin resistance. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Various forms of insulin resistance, and of other diseases and

clinical conditions associated with INSR.

[19137] The function of INSR has been established by previous studies. The insulin (INS; 176730) receptor is a tetramer of 2 alpha and 2 beta subunits. The alpha and beta subunits are coded by a single gene and are joined by disulfide bonds, a mechanism parallel to that of the ligand, insulin (Rubin, 1984). Mutation in either the structural gene or some of the processing steps may lead to insulin resistance. Ullrich et al. (1985) deduced the entire 1,370-amino acid sequence from a cDNA clone. The precursor starts with a 27- amino acid signal sequence, followed by the receptor alpha subunit, a precursor processing enzyme cleavage site, then the beta subunit containing a single 23- amino acid transmembrane sequence. Seino et al. (1989) found that the INSR gene spans more than 120 kb and has 22 exons. All introns interrupt protein coding regions of the gene. The 11 exons encoding the alpha subunit are dispersed over more than 90 kb, whereas the 11 exons encoding the beta subunit are located together in a region of about 30 kb. Three transcriptional initiation sites were identified, located 276, 282, and 283 bp upstream of the translation initiation site. There is heterogeneity of insulin receptors in different tissues Leibiger et

al. (2001) showed that insulin activates the transcription of its own gene and that of the beta- cell glucokinase gene (GCK; 138079) by different mechanisms. Whereas INS gene transcription is promoted by signaling through INSR type A (without exon 11), phosphatidylinositol 3- kinase (PI3K) class IA (see OMIM Ref. No. 171833), and the 70- kD S6 kinase, insulin stimulates the beta- cell GCK gene by signaling via INSR type B (with exon 11), PI3K class II (see OMIM Ref. No. 602838)- like activity, and protein kinase B (OMIM Ref. No. 164730). These data provided evidence for selectivity in insulin action via the 2 INSR isoforms, the molecular basis being preferential signaling through different PI3K and protein kinases. Using a yeast 2- hybrid system, Dey et al. (1998) identified a regulatory subunit of PI3K, PIK3R3 (OMIM Ref. No. 606076), as a binding partner of INSR. They concluded that PIK3R3 interacts with IGF1R (OMIM Ref. No. 147370) and INSR in a kinase- dependent manner, providing an alternative pathway for the activation of PI3K by these 2 receptors. Rajala and Anderson (2001) sought to identify the tyrosine-phosphorylated protein(s) in the bovine rod outer segments (ROS) that are associated with PI3K. They concluded that tyrosine phosphorylation of the beta subunit of the

insulin receptor is involved in the regulation of PI3K activity in the ROS.

[19138] Animal model experiments lend further support to the function of INSR. Belke et al. (2002) generated mice with a cardiomyocyte- specific insulin receptor knockout (CIRKO), using cre/loxP recombination. Hearts of CIRKO mice were 20 to 30% smaller because of decreased postnatal hypertrophy of cardiomyocytes; they had persistent expression of the fetal beta- myosin heavy chain isoform, approximately half the normal expression of glucose transporter- 1 (GLUT1; 138140), and a 2- fold increase in GLUT4 expression. Cardiac glucose uptake was increased in vivo, glycolysis was increased in isolated working hearts, and there was reduced expression of enzymes that catalyze mitochondrial beta- oxidation, leading to decreased fatty acid oxidation rates.

[19139] It is appreciated that the abovementioned animal model for INSR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[19140] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19141] Leibiger, B.; Leibiger, I. B.; Moede, T.; Kemper, S.; Kulkarni, R. N.; Kahn, C. R.; de Vargas, L. M.; Berggren, P.- O. : Selective insulin signaling through A and B insulin receptors regulates transcription of insulin and glucokinase genes in pancreatic beta cells. Molec. Cell 7: 559- 570, 2001. ; and

[19143] Further studies establishing the function and utilities of INSR are found in John Hopkins OMIM database record ID 147670, and in cited publications listed in Table 5, which are hereby incorporated by reference.Inositol 1,4,5-triphosphate receptor, type 2 (ITPR2, Accession NP_002214.1) is another GAM116 target gene, herein designated TARGET GENE. ITPR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITPR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:19491, to the nucleotide sequence of GAM116

RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19144] Another function of GAM116 is therefore inhibition of Inositol 1,4,5-triphosphate receptor, type 2 (ITPR2, Accession NP_002214.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2.

[19145] Potassium inwardly-rectifying channel, subfamily j, member 10 (KCNJ10, Accession NP_002232.2) is another GAM116 target gene, herein designated TARGET GENE. KCNJ10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNJ10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:5460, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19146] Another function of GAM116 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 10 (KCNJ10, Accession NP_002232.2), a gene which may be responsible for potassium buffering action of glial cells in the brain. Accordingly, utilities of GAM116 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10.

[19147] The function of KCNJ10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Potassium large conductance calcium-activated channel, subfamily m, alpha member 1 (KCNMA1, Accession NP_002238.2) is another GAM116 target gene, herein designated TARGET GENE. KCNMA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNMA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNMA1 BINDING SITE, designated SEQ ID:8898, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19148] Another function of GAM116 is therefore inhibition of Potassium large conductance calcium-activated channel, subfamily m, alpha member 1 (KCNMA1, Accession NP_002238.2), a gene which is an alpha subunit 1 of the large conductance calcium- activated K channel. Accordingly, utilities of GAM116 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with KCNMA1.

[19149] The function of KCNMA1 has been established by previous studies. Potassium channels play a key role in the transmission of information within the neuromuscular system by translating ionic fluxes across cellular membrane into electrical impulses and by interconverting and transducing electrical and chemical signals. Among this class of polypeptides, K+ channels represent the most extensive and diverse group. While all K+ channels are alike in their selective permeability to K+ over other monovalent ions, they can be subdivided into 2 distinct types: voltage- activated K+ channels, which respond to changes in membrane potential, and Ca(2+)- activated K+ channels, which respond primarily to increases in intracellular calcium ion concentrations. The first structural gene of a calcium- activated potassium channel was isolated through study of mutations of the Drosophila 'slowpoke' (slo) locus, which were found specifically to eliminate a fast, calcium- activated potassium current in adult and larval muscles and in larval neurons. Pallanck and Ganetzky (1994) cloned human and mouse homologs of the Drosophila gene and demonstrated that the encoded polypeptides have more

than 50% amino acid identity with their Drosophila counterparts. In addition, like the Drosophila 'slowpoke' gene, both the mouse and the human genes generate multiple transcripts by alternative splicing Silberberg and Magleby (1999) suggested that the finding of Valverde et al. (1999) that estrogen directly activates vascular smooth muscle maxi- K channels may pave the way for the design of new drugs for prevention of cardiovascular disease

[19150]

[19154] Further studies establishing the function and utilities of KCNMA1 are found in John Hopkins OMIM database record ID 600150, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0062

(Accession XP_046677.3) is another GAM116 target gene, herein designated TARGET GENE. KIAA0062 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0062, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0062 BINDING SITE, designated SEQ ID:12869, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19155] Another function of GAM116 is therefore inhibition of KIAA0062 (Accession XP_046677.3) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0062.

[19156] KIAA0240 (Accession XP_166479.2) is another GAM116 target gene, herein designated TARGET GENE. KIAA0240 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0240, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0240 BINDING SITE, designated SEQ ID:18158, to the

nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19157] Another function of GAM116 is therefore inhibition of KIAA0240 (Accession XP_166479.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0240.

[19158] KIAA0316 (Accession XP_045712.5) is another GAM116 target gene, herein designated TARGET GENE. KIAA0316 BINDING SITE1 and KIAA0316 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0316, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0316 BINDING SITE1 and KIAA0316 BINDING SITE2, designated SEQ ID:11176 and SEQ ID:13615 respectively, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19159] Another function of GAM116 is therefore inhibition of KIAA0316 (Accession XP_045712.5) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0316.

[19160] KIAA0527 (Accession XP_171054.1) is another GAM116 target gene, herein designated TARGET GENE. KIAA0527 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0527, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:4493, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19161] Another function of GAM116 is therefore inhibition of KIAA0527 (Accession XP_171054.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527.

[19162] KIAA0663 (Accession NP_055642.1) is another GAM116 target gene, herein designated TARGET GENE. KIAA0663 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0663 BINDING SITE, designated SEQ ID:15758, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19163] Another function of GAM116 is therefore inhibition of KIAA0663 (Accession NP_055642.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663.

[19164] KIAA0682 (Accession NP_055667.1) is another GAM116 target gene, herein designated TARGET GENE. KIAA0682 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0682, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:4750, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19165] Another function of GAM116 is therefore inhibition of KIAA0682 (Accession NP_055667.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682.

[19166] KIAA1036 (Accession NP_055724.1) is another GAM116 target gene, herein designated TARGET GENE. KIAA1036 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:3396, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19167] Another function of GAM116 is therefore inhibition of KIAA1036 (Accession NP_055724.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036.

[19168] KIAA1055 (Accession NP_055894.1) is another GAM116 target gene, herein designated TARGET GENE. KIAA1055 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1055, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1055 BINDING SITE, designated SEQ ID:9566, to the

nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19169] Another function of GAM116 is therefore inhibition of KIAA1055 (Accession NP_055894.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1055.

[19170] KIAA1069 (Accession XP_042635.3) is another GAM116 target gene, herein designated TARGET GENE. KIAA1069 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1069, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1069 BINDING SITE, designated SEQ ID:9350, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19171] Another function of GAM116 is therefore inhibition of KIAA1069 (Accession XP_042635.3) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1069.

[19172] KIAA1102 (Accession XP_044461.6) is another GAM116

target gene, herein designated TARGET GENE. KIAA1102 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1102, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1102 BINDING SITE, designated SEQ ID:12914, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19173] Another function of GAM116 is therefore inhibition of KIAA1102 (Accession XP_044461.6) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1102.

[19174] KIAA1446 (Accession NP_065887.1) is another GAM116 target gene, herein designated TARGET GENE. KIAA1446 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1446, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1446 BINDING SITE, designated SEQ ID:7053, to the nucleotide sequence of GAM116 RNA, herein designated

GAM RNA, also designated SEQ ID:301.

[19175] Another function of GAM116 is therefore inhibition of KIAA1446 (Accession NP_065887.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1446.

[19176] KIAA1727 (Accession XP_034262.4) is another GAM116 target gene, herein designated TARGET GENE. KIAA1727 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:18595, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19177] Another function of GAM116 is therefore inhibition of KIAA1727 (Accession XP_034262.4) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727.

[19178] KIAA1737 (Accession NP_219494.1) is another GAM116 target gene, herein designated TARGET GENE. KIAA1737

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:19523, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19179] Another function of GAM116 is therefore inhibition of KIAA1737 (Accession NP_219494.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737.

[19180] KIAA1755 (Accession XP_028810.2) is another GAM116 target gene, herein designated TARGET GENE. KIAA1755 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1755, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:530, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19181] Another function of GAM116 is therefore inhibition of KIAA1755 (Accession XP_028810.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755.

[19182] Lactation elevated 1 (LACE1, Accession NP_660358.2) is another GAM116 target gene, herein designated TARGET GENE. LACE1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LACE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LACE1 BINDING SITE, designated SEQ ID:17474, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19183] Another function of GAM116 is therefore inhibition of Lactation elevated 1 (LACE1, Accession NP_660358.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LACE1.

[19184] Lethal giant larvae homolog 1 (drosophila) (LLGL1, Accession NP_004131.2) is another GAM116 target gene, herein designated TARGET GENE. LLGL1 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by LLGL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LLGL1 BINDING SITE, designated SEQ ID:4923, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19185] Another function of GAM116 is therefore inhibition of Lethal giant larvae homolog 1 (drosophila) (LLGL1, Accession NP_004131.2), a gene which has a role in control of cell proliferation and differentiation during development. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LLGL1.

[19186] The function of LLGL1 has been established by previous studies. Ohshiro et al. (2000) demonstrated in Drosophila that lethal giant larvae (Lgl) is essential for asymmetric cortical localization of all basal determinants in mitotic neuroblasts, and is therefore indispensable for neural fate decisions. Lgl, which itself is uniformly cortical, interacts with several types of myosin to localize the determinants. Another tumor suppressor protein, lethal discs large (Dlg) (DLG1; 601014), participates in this process by regulating

the localization of Lgl. The localization of the apical components is unaffected in Lgl or Dlg mutants. Thus, Lgl and Dlg act in a common process that differentially mediates cortical protein targeting in mitotic neuroblasts, and creates intrinsic differences between daughter cells. Peng et al. (2000) showed that the tumor suppressor genes Lgl and Dlg regulate basal protein targeting, but not apical complex formation or spindle orientation, in both embryonic and larval Drosophila neuroblasts. Dlg protein is apically enriched and is required for maintaining cortical localization of Lgl protein. Basal protein targeting requires microfilament and myosin function, yet the Lgl phenotype is strongly suppressed by reducing levels of myosin II. Peng et al. (2000) concluded that Dlg and Lgl promote, and myosin II inhibits, actomyosin- dependent basal protein targeting in neuroblasts.

[19187]

[19188] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19189] Ohshiro, T.; Yagami, T.; Zhang, C.; Matsuzaki, F. : Role of cortical tumour- suppressor proteins in asymmetric division of Drosophila neuroblast. Nature 408: 593- 596,

2000. ; and

[19190] Peng, C.- Y.; Manning, L.; Albertson, R.; Doe, C. Q. : The tumour- suppressor genes lgl and dlg regulate basal protein targeting in Drosophila neuroblasts. Nature 408: 596- 600, 2000.

[19191] Further studies establishing the function and utilities of LLGL1 are found in John Hopkins OMIM database record ID 600966, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC115123 (Accession XP_055276.1) is another GAM116 target gene, herein designated TARGET GENE. LOC115123 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115123 BINDING SITE, designated SEQ ID:18723, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19192] Another function of GAM116 is therefore inhibition of LOC115123 (Accession XP_055276.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC115123.

[19193] LOC116166 (Accession XP_007651.11) is another GAM116 target gene, herein designated TARGET GENE. LOC116166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC116166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116166 BINDING SITE, designated SEQ ID:10531, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19194] Another function of GAM116 is therefore inhibition of LOC116166 (Accession XP_007651.11) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116166.

[19195] LOC118487 (Accession XP_058325.1) is another GAM116 target gene, herein designated TARGET GENE. LOC118487 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC118487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC118487 BINDING SITE, designated SEQ ID:2230, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19196] Another function of GAM116 is therefore inhibition of LOC118487 (Accession XP_058325.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118487.

[19197] LOC121498 (Accession XP_062669.7) is another GAM116 target gene, herein designated TARGET GENE. LOC121498 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC121498, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC121498 BINDING SITE, designated SEQ ID:6256, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19198] Another function of GAM116 is therefore inhibition of LOC121498 (Accession XP_062669.7) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC121498.

[19199] LOC123722 (Accession XP_058721.2) is another GAM116 target gene, herein designated TARGET GENE. LOC123722 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC123722, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123722 BINDING SITE, designated SEQ ID:17925, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19200] Another function of GAM116 is therefore inhibition of LOC123722 (Accession XP_058721.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123722.

[19201] LOC137829 (Accession XP_059923.2) is another GAM116 target gene, herein designated TARGET GENE. LOC137829 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC137829, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC137829 BINDING SITE, designated SEQ ID:11715, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19202] Another function of GAM116 is therefore inhibition of LOC137829 (Accession XP_059923.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137829.

[19203] LOC144809 (Accession XP_096680.2) is another GAM116 target gene, herein designated TARGET GENE. LOC144809 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144809, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144809 BINDING SITE, designated SEQ ID:18252, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19204] Another function of GAM116 is therefore inhibition of LOC144809 (Accession XP_096680.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144809.

[19205] LOC148823 (Accession NP_660321.1) is another GAM116 target gene, herein designated TARGET GENE. LOC148823 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148823, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148823 BINDING SITE, designated SEQ ID:5548, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19206] Another function of GAM116 is therefore inhibition of LOC148823 (Accession NP_660321.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148823.

[19207] LOC149464 (Accession XP_097645.1) is another GAM116 target gene, herein designated TARGET GENE. LOC149464 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149464, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149464 BINDING SITE, designated SEQ ID:16914, to

the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19208] Another function of GAM116 is therefore inhibition of LOC149464 (Accession XP_097645.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149464.

[19209] LOC151610 (Accession XP_087245.1) is another GAM116 target gene, herein designated TARGET GENE. LOC151610 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151610, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:15421, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19210] Another function of GAM116 is therefore inhibition of LOC151610 (Accession XP_087245.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151610.

[19211] LOC152765 (Accession XP_087519.1) is another GAM116

target gene, herein designated TARGET GENE. LOC152765 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152765, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:18619, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19212] Another function of GAM116 is therefore inhibition of LOC152765 (Accession XP_087519.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765.

[19213] LOC153232 (Accession XP_098331.1) is another GAM116 target gene, herein designated TARGET GENE. LOC153232 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153232 BINDING SITE, designated SEQ ID:14107, to the nucleotide sequence of GAM116 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:301.

[19214] Another function of GAM116 is therefore inhibition of LOC153232 (Accession XP_098331.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153232.

[19215] LOC153516 (Accession NP_612500.1) is another GAM116 target gene, herein designated TARGET GENE. LOC153516 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153516, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153516 BINDING SITE, designated SEQ ID:19757, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19216] Another function of GAM116 is therefore inhibition of LOC153516 (Accession NP_612500.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153516.

[19217] LOC153811 (Accession XP_087779.2) is another GAM116 target gene, herein designated TARGET GENE. LOC153811

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153811, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:12476, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19218] Another function of GAM116 is therefore inhibition of LOC153811 (Accession XP_087779.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153811.

[19219] LOC157627 (Accession XP_088347.2) is another GAM116 target gene, herein designated TARGET GENE. LOC157627 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157627, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157627 BINDING SITE, designated SEQ ID:13960, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19220] Another function of GAM116 is therefore inhibition of LOC157627 (Accession XP_088347.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157627.

[19221] LOC166077 (Accession XP_093643.3) is another GAM116 target gene, herein designated TARGET GENE. LOC166077 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC166077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC166077 BINDING SITE, designated SEQ ID:12164, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19222] Another function of GAM116 is therefore inhibition of LOC166077 (Accession XP_093643.3) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166077.

[19223] LOC201164 (Accession NP_849158.1) is another GAM116 target gene, herein designated TARGET GENE. LOC201164 BINDING SITE is a target binding site found in the 3` un-

translated region of multiple transcripts of mRNA encoded by LOC201164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:3600, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19224] Another function of GAM116 is therefore inhibition of LOC201164 (Accession NP_849158.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164.

[19225] LOC201164 (Accession XP_290750.1) is another GAM116 target gene, herein designated TARGET GENE. LOC201164 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC201164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:3600, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:301.

[19226] Another function of GAM116 is therefore inhibition of LOC201164 (Accession XP_290750.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164.

[19227] LOC203447 (Accession XP_114703.1) is another GAM116 target gene, herein designated TARGET GENE. LOC203447 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC203447, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203447 BINDING SITE, designated SEQ ID:2716, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19228] Another function of GAM116 is therefore inhibition of LOC203447 (Accession XP_114703.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203447.

[19229] LOC203562 (Accession XP_117553.1) is another GAM116 target gene, herein designated TARGET GENE. LOC203562

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC203562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203562 BINDING SITE, designated SEQ ID:11114, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19230] Another function of GAM116 is therefore inhibition of LOC203562 (Accession XP_117553.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203562.

[19231] LOC219842 (Accession XP_167775.1) is another GAM116 target gene, herein designated TARGET GENE. LOC219842 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219842, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219842 BINDING SITE, designated SEQ ID:19459, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19232] Another function of GAM116 is therefore inhibition of LOC219842 (Accession XP_167775.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219842.

[19233] LOC220635 (Accession XP_165433.1) is another GAM116 target gene, herein designated TARGET GENE. LOC220635 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220635, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220635 BINDING SITE, designated SEQ ID:13427, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19234] Another function of GAM116 is therefore inhibition of LOC220635 (Accession XP_165433.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220635.

[19235] LOC253820 (Accession XP_171040.2) is another GAM116 target gene, herein designated TARGET GENE. LOC253820 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC253820, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253820 BINDING SITE, designated SEQ ID:11595, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19236] Another function of GAM116 is therefore inhibition of LOC253820 (Accession XP_171040.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253820.

[19237] LOC282905 (Accession XP_212606.1) is another GAM116 target gene, herein designated TARGET GENE. LOC282905 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282905, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282905 BINDING SITE, designated SEQ ID:15939, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19238] Another function of GAM116 is therefore inhibition of

LOC282905 (Accession XP_212606.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282905.

[19239] LOC282943 (Accession XP_212647.1) is another GAM116 target gene, herein designated TARGET GENE. LOC282943 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282943, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282943 BINDING SITE, designated SEQ ID:15939, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19240] Another function of GAM116 is therefore inhibition of LOC282943 (Accession XP_212647.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282943.

[19241] LOC283295 (Accession XP_210964.1) is another GAM116 target gene, herein designated TARGET GENE. LOC283295 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283295, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283295 BINDING SITE, designated SEQ ID:4814, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19242] Another function of GAM116 is therefore inhibition of LOC283295 (Accession XP_210964.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283295.

[19243] LOC283686 (Accession XP_211164.1) is another GAM116 target gene, herein designated TARGET GENE. LOC283686 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283686, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283686 BINDING SITE, designated SEQ ID:5207, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19244] Another function of GAM116 is therefore inhibition of LOC283686 (Accession XP_211164.1) . Accordingly, utili-

ties of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283686.

[19245] LOC283889 (Accession XP_208899.1) is another GAM116 target gene, herein designated TARGET GENE. LOC283889 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283889 BINDING SITE, designated SEQ ID:19503, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19246] Another function of GAM116 is therefore inhibition of LOC283889 (Accession XP_208899.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283889.

[19247] LOC283922 (Accession XP_208908.1) is another GAM116 target gene, herein designated TARGET GENE. LOC283922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283922, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283922 BINDING SITE, designated SEQ ID:9479, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19248] Another function of GAM116 is therefore inhibition of LOC283922 (Accession XP_208908.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283922.

[19249] LOC284048 (Accession XP_208152.1) is another GAM116 target gene, herein designated TARGET GENE. LOC284048 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284048, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284048 BINDING SITE, designated SEQ ID:11823, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19250] Another function of GAM116 is therefore inhibition of LOC284048 (Accession XP_208152.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284048.

[19251] LOC284294 (Accession XP_211421.1) is another GAM116 target gene, herein designated TARGET GENE. LOC284294 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284294 BINDING SITE, designated SEQ ID:19309, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19252] Another function of GAM116 is therefore inhibition of LOC284294 (Accession XP_211421.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284294.

[19253] LOC284462 (Accession XP_211475.1) is another GAM116 target gene, herein designated TARGET GENE. LOC284462 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284462 BINDING SITE, designated SEQ ID:19943, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19254] Another function of GAM116 is therefore inhibition of LOC284462 (Accession XP_211475.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284462.

[19255] LOC284642 (Accession XP_208231.1) is another GAM116 target gene, herein designated TARGET GENE. LOC284642 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284642, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284642 BINDING SITE, designated SEQ ID:4242, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19256] Another function of GAM116 is therefore inhibition of LOC284642 (Accession XP_208231.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284642.

[19257] LOC284828 (Accession XP_211650.1) is another GAM116 target gene, herein designated TARGET GENE. LOC284828 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284828, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284828 BINDING SITE, designated SEQ ID:9072, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19258] Another function of GAM116 is therefore inhibition of LOC284828 (Accession XP_211650.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284828.

[19259] LOC284837 (Accession XP_211658.1) is another GAM116 target gene, herein designated TARGET GENE. LOC284837 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC284837 BINDING SITE, designated SEQ ID:1526, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19260] Another function of GAM116 is therefore inhibition of LOC284837 (Accession XP_211658.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284837.

[19261] LOC284947 (Accession XP_211705.1) is another GAM116 target gene, herein designated TARGET GENE. LOC284947 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284947, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284947 BINDING SITE, designated SEQ ID:1527, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19262] Another function of GAM116 is therefore inhibition of LOC284947 (Accession XP_211705.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284947.

[19263] LOC285035 (Accession XP_209446.1) is another GAM116 target gene, herein designated TARGET GENE. LOC285035 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285035 BINDING SITE, designated SEQ ID:16141, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19264] Another function of GAM116 is therefore inhibition of LOC285035 (Accession XP_209446.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285035.

[19265] LOC285131 (Accession XP_211772.1) is another GAM116 target gene, herein designated TARGET GENE. LOC285131 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285131, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285131 BINDING SITE, designated SEQ ID:15846, to

the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19266] Another function of GAM116 is therefore inhibition of LOC285131 (Accession XP_211772.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285131.

[19267] LOC285434 (Accession XP_209608.1) is another GAM116 target gene, herein designated TARGET GENE. LOC285434 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285434, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285434 BINDING SITE, designated SEQ ID:12379, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19268] Another function of GAM116 is therefore inhibition of LOC285434 (Accession XP_209608.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285434.

[19269] LOC285560 (Accession XP_209660.1) is another GAM116

target gene, herein designated TARGET GENE. LOC285560 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285560, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285560 BINDING SITE, designated SEQ ID:19592, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19270] Another function of GAM116 is therefore inhibition of LOC285560 (Accession XP_209660.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285560.

[19271] LOC285727 (Accession XP_212000.1) is another GAM116 target gene, herein designated TARGET GENE. LOC285727 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285727 BINDING SITE, designated SEQ ID:4300, to the nucleotide sequence of GAM116 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:301.

[19272] Another function of GAM116 is therefore inhibition of LOC285727 (Accession XP_212000.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285727.

[19273] LOC285830 (Accession XP_212043.1) is another GAM116 target gene, herein designated TARGET GENE. LOC285830 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285830, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285830 BINDING SITE, designated SEQ ID:15939, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19274] Another function of GAM116 is therefore inhibition of LOC285830 (Accession XP_212043.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285830.

[19275] LOC285939 (Accession XP_208364.1) is another GAM116 target gene, herein designated TARGET GENE. LOC285939

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285939, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285939 BINDING SITE, designated SEQ ID:3194, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19276] Another function of GAM116 is therefore inhibition of LOC285939 (Accession XP_208364.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285939.

[19277] LOC286026 (Accession XP_212119.1) is another GAM116 target gene, herein designated TARGET GENE. LOC286026 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286026, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286026 BINDING SITE, designated SEQ ID:5267, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19278] Another function of GAM116 is therefore inhibition of LOC286026 (Accession XP_212119.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286026.

[19279] LOC286126 (Accession XP_212185.1) is another GAM116 target gene, herein designated TARGET GENE. LOC286126 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286126, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286126 BINDING SITE, designated SEQ ID:12515, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19280] Another function of GAM116 is therefore inhibition of LOC286126 (Accession XP_212185.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286126.

[19281] LOC286500 (Accession XP_210080.1) is another GAM116 target gene, herein designated TARGET GENE. LOC286500 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC286500, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286500 BINDING SITE, designated SEQ ID:9848, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19282] Another function of GAM116 is therefore inhibition of LOC286500 (Accession XP_210080.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286500.

[19283] LOC338959 (Accession XP_294754.1) is another GAM116 target gene, herein designated TARGET GENE. LOC338959 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338959, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338959 BINDING SITE, designated SEQ ID:6175, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19284] Another function of GAM116 is therefore inhibition of

LOC338959 (Accession XP_294754.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338959.

[19285] LOC338987 (Accession XP_290664.1) is another GAM116 target gene, herein designated TARGET GENE. LOC338987 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338987 BINDING SITE, designated SEQ ID:3739, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19286] Another function of GAM116 is therefore inhibition of LOC338987 (Accession XP_290664.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338987.

[19287] LOC339494 (Accession XP_290925.1) is another GAM116 target gene, herein designated TARGET GENE. LOC339494 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339494, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339494 BINDING SITE, designated SEQ ID:17103, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19288] Another function of GAM116 is therefore inhibition of LOC339494 (Accession XP_290925.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339494.

[19289] LOC339622 (Accession XP_295016.1) is another GAM116 target gene, herein designated TARGET GENE. LOC339622 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339622 BINDING SITE, designated SEQ ID:8835, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19290] Another function of GAM116 is therefore inhibition of LOC339622 (Accession XP_295016.1) . Accordingly, utili-

ties of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339622.

[19291] LOC339659 (Accession XP_290981.1) is another GAM116 target gene, herein designated TARGET GENE. LOC339659 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339659, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339659 BINDING SITE, designated SEQ ID:2508, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19292] Another function of GAM116 is therefore inhibition of LOC339659 (Accession XP_290981.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339659.

[19293] LOC340128 (Accession XP_295164.2) is another GAM116 target gene, herein designated TARGET GENE. LOC340128 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340128, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340128 BINDING SITE, designated SEQ ID:2717, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19294] Another function of GAM116 is therefore inhibition of LOC340128 (Accession XP_295164.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340128.

[19295] LOC340449 (Accession XP_290424.2) is another GAM116 target gene, herein designated TARGET GENE. LOC340449 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340449, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340449 BINDING SITE, designated SEQ ID:17429, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19296] Another function of GAM116 is therefore inhibition of LOC340449 (Accession XP_290424.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC340449.

[19297] LOC341041 (Accession XP_295977.1) is another GAM116 target gene, herein designated TARGET GENE. LOC341041 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC341041, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC341041 BINDING SITE, designated SEQ ID:19443, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19298] Another function of GAM116 is therefore inhibition of LOC341041 (Accession XP_295977.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC341041.

[19299] LOC343838 (Accession XP_293260.2) is another GAM116 target gene, herein designated TARGET GENE. LOC343838 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC343838, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC343838 BINDING SITE, designated SEQ ID:19387, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19300] Another function of GAM116 is therefore inhibition of LOC343838 (Accession XP_293260.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC343838.

[19301] LOC344622 (Accession XP_293503.1) is another GAM116 target gene, herein designated TARGET GENE. LOC344622 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC344622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC344622 BINDING SITE, designated SEQ ID:4215, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19302] Another function of GAM116 is therefore inhibition of LOC344622 (Accession XP_293503.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC344622.

[19303] LOC347767 (Accession XP_300531.1) is another GAM116 target gene, herein designated TARGET GENE. LOC347767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347767 BINDING SITE, designated SEQ ID:17800, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19304] Another function of GAM116 is therefore inhibition of LOC347767 (Accession XP_300531.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347767.

[19305] LOC347924 (Accession XP_300570.1) is another GAM116 target gene, herein designated TARGET GENE. LOC347924 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC347924 BINDING SITE, designated SEQ ID:18280, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19306] Another function of GAM116 is therefore inhibition of LOC347924 (Accession XP_300570.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347924.

[19307] LOC348035 (Accession XP_300595.1) is another GAM116 target gene, herein designated TARGET GENE. LOC348035 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348035 BINDING SITE, designated SEQ ID:11344, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19308] Another function of GAM116 is therefore inhibition of LOC348035 (Accession XP_300595.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348035.

[19309] LOC348182 (Accession XP_302676.1) is another GAM116 target gene, herein designated TARGET GENE. LOC348182 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348182 BINDING SITE, designated SEQ ID:5461, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19310] Another function of GAM116 is therefore inhibition of LOC348182 (Accession XP_302676.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348182.

[19311] LOC348720 (Accession XP_300397.1) is another GAM116 target gene, herein designated TARGET GENE. LOC348720 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348720, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348720 BINDING SITE, designated SEQ ID:13427, to

the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19312] Another function of GAM116 is therefore inhibition of LOC348720 (Accession XP_300397.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348720.

[19313] LOC348761 (Accession XP_302869.1) is another GAM116 target gene, herein designated TARGET GENE. LOC348761 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348761, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348761 BINDING SITE, designated SEQ ID:15606, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19314] Another function of GAM116 is therefore inhibition of LOC348761 (Accession XP_302869.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348761.

[19315] LOC348769 (Accession XP_300403.1) is another GAM116

target gene, herein designated TARGET GENE. LOC348769 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348769, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348769 BINDING SITE, designated SEQ ID:13427, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19316] Another function of GAM116 is therefore inhibition of LOC348769 (Accession XP_300403.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348769.

[19317] LOC348780 (Accession XP_302884.1) is another GAM116 target gene, herein designated TARGET GENE. LOC348780 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348780, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348780 BINDING SITE, designated SEQ ID:10129, to the nucleotide sequence of GAM116 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:301.

[19318] Another function of GAM116 is therefore inhibition of LOC348780 (Accession XP_302884.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348780.

[19319] LOC349277 (Accession XP_303016.1) is another GAM116 target gene, herein designated TARGET GENE. LOC349277 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349277, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349277 BINDING SITE, designated SEQ ID:16327, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19320] Another function of GAM116 is therefore inhibition of LOC349277 (Accession XP_303016.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349277.

[19321] LOC56181 (Accession NP_062457.2) is another GAM116 target gene, herein designated TARGET GENE. LOC56181

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC56181, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC56181 BINDING SITE, designated SEQ ID:18280, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19322] Another function of GAM116 is therefore inhibition of LOC56181 (Accession NP_062457.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56181.

[19323] LOC57117 (Accession NP_065128.2) is another GAM116 target gene, herein designated TARGET GENE. LOC57117 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC57117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57117 BINDING SITE, designated SEQ ID:3740, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19324] Another function of GAM116 is therefore inhibition of LOC57117 (Accession NP_065128.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57117.

[19325] LOC83693 (Accession NP_113651.3) is another GAM116 target gene, herein designated TARGET GENE. LOC83693 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC83693, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC83693 BINDING SITE, designated SEQ ID:8686, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19326] Another function of GAM116 is therefore inhibition of LOC83693 (Accession NP_113651.3) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83693.

[19327] LOC91768 (Accession NP_612384.1) is another GAM116 target gene, herein designated TARGET GENE. LOC91768 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC91768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91768 BINDING SITE, designated SEQ ID:2057, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19328] Another function of GAM116 is therefore inhibition of LOC91768 (Accession NP_612384.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91768.

[19329] LOC92568 (Accession XP_045852.1) is another GAM116 target gene, herein designated TARGET GENE. LOC92568 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92568, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:18855, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19330] Another function of GAM116 is therefore inhibition of

LOC92568 (Accession XP_045852.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568.

[19331] LOC93463 (Accession XP_051528.1) is another GAM116 target gene, herein designated TARGET GENE. LOC93463 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93463, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93463 BINDING SITE, designated SEQ ID:16757, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19332] Another function of GAM116 is therefore inhibition of LOC93463 (Accession XP_051528.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93463.

[19333] LOC94105 (Accession NP_149986.1) is another GAM116 target gene, herein designated TARGET GENE. LOC94105 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC94105, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC94105 BINDING SITE, designated SEQ ID:13826, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19334] Another function of GAM116 is therefore inhibition of LOC94105 (Accession NP_149986.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC94105.

[19335] Loss of heterozygosity, 11, chromosomal region 2, gene a (LOH11CR2A, Accession NP_055437.1) is another GAM116 target gene, herein designated TARGET GENE. LOH11CR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOH11CR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOH11CR2A BINDING SITE, designated SEQ ID:12927, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19336] Another function of GAM116 is therefore inhibition of Loss of heterozygosity, 11, chromosomal region 2, gene a (LOH11CR2A, Accession NP_055437.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOH11CR2A.

[19337] Mitogen-activated protein kinase kinase kinase 7 (MAP3K7, Accession NP_663305.1) is another GAM116 target gene, herein designated TARGET GENE. MAP3K7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAP3K7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K7 BINDING SITE, designated SEQ ID:13790, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19338] Another function of GAM116 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 7 (MAP3K7, Accession NP_663305.1), a gene which can phosphorylate and activate yet undefined mapkks. mediator of tgf- beta signal transduction. stimulates nf- kappa b activation. Ac-

cordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7.

[19339] The function of MAP3K7 has been established by previous studies. The MAP kinase (MAPK) cascades constitute functional units that couple upstream input signals to a variety of outputs through pathways that involve 3 protein kinases. MAPKKK (MAP3K; OMIM Ref. No. 602448) phosphorylates MAPKK (MAP2K; OMIM Ref. No. 176872), which in turn phosphorylates and activates MAPK (see OMIM Ref. No. 176948). One MAPK pathway in S. cerevisiae controls the response to mating pheromone. Yamaguchi et al. (1995) screened a mouse cDNA library for clones that could act as MAPKKKs, suppressing a defect in the mating pheromone response pathway. They identified a cDNA that encodes a predicted 579- amino acid protein, which they named TAK1 (TGF- beta- activated kinase). TAK1 has a putative N- terminal protein kinase domain. In mammalian cells, TAK1 regulates transcription by transforming growth factor- beta (TGFB; 190180). Only TAK1 protein missing the N- terminal 22 amino acids suppressed the yeast defect. This activated form also signaled in the absence of TGFB in mammalian cells Kondo et al. (1998)

identified human ESTs that were homologous to mouse TAK1 and used the resulting sequence information to clone human TAK1 from lung cDNA. The predicted 579-amino acid human TAK1 protein is 99% identical to the mouse TAK1 protein. On Northern blots, TAK1 was expressed as a 3- kb mRNA in all tissues tested. Kondo et al. (1998) found 2 isoforms of TAK1 that differed by an insertion of 27 amino acids after amino acid 403

[19340]

[19341] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19342] Yamaguchi, K.; Shirakabe, K.; Shibuya, H.; Irie, K.; Oishi, I.; Ueno, N.; Taniguchi, T.; Nishida, E.; Matsumoto, K. : Identification of a member of the MAPKKK family as a potential mediator of TGF- beta signal transduction. Science 270: 2008- 2011, 1995. ; and

[19343] Kondo, M.; Osada, H.; Uchida, K.; Yanagisawa, K.; Masuda, A.; Takagi, K.; Takahashi, T.; Takahashi, T. : Molecular cloning of human TAK1 and its mutational analysis in human lung cancer.

[19344] Further studies establishing the function and utilities of MAP3K7 are found in John Hopkins OMIM database record

ID 602614, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mitogen-activated protein kinase kinase kinase 7 (MAP3K7, Accession NP_663306.1) is another GAM116 target gene, herein designated TARGET GENE. MAP3K7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAP3K7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K7 BINDING SITE, designated SEQ ID:13790, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19345] Another function of GAM116 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 7 (MAP3K7, Accession NP_663306.1), a gene which can phosphorylate and activate yet undefined mapkks. mediator of tgf- beta signal transduction. stimulates nf- kappa b activation. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7.

[19346] The function of MAP3K7 has been established by previous

studies. The MAP kinase (MAPK) cascades constitute functional units that couple upstream input signals to a variety of outputs through pathways that involve 3 protein kinases. MAPKKK (MAP3K; OMIM Ref. No. 602448) phosphorylates MAPKK (MAP2K; OMIM Ref. No. 176872), which in turn phosphorylates and activates MAPK (see OMIM Ref. No. 176948). One MAPK pathway in S. cerevisiae controls the response to mating pheromone. Yamaguchi et al. (1995) screened a mouse cDNA library for clones that could act as MAPKKKs, suppressing a defect in the mating pheromone response pathway. They identified a cDNA that encodes a predicted 579- amino acid protein, which they named TAK1 (TGF- beta- activated kinase). TAK1 has a putative N- terminal protein kinase domain. In mammalian cells, TAK1 regulates transcription by transforming growth factor- beta (TGFB; 190180). Only TAK1 protein missing the N- terminal 22 amino acids suppressed the yeast defect. This activated form also signaled in the absence of TGFB in mammalian cells Kondo et al. (1998) identified human ESTs that were homologous to mouse TAK1 and used the resulting sequence information to clone human TAK1 from lung cDNA. The predicted 579-amino acid human TAK1 protein is 99% identical to the

mouse TAK1 protein. On Northern blots, TAK1 was expressed as a 3- kb mRNA in all tissues tested. Kondo et al. (1998) found 2 isoforms of TAK1 that differed by an insertion of 27 amino acids after amino acid 403

[19347]

[19348] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19349] Yamaguchi, K.; Shirakabe, K.; Shibuya, H.; Irie, K.; Oishi, I.; Ueno, N.; Taniguchi, T.; Nishida, E.; Matsumoto, K. : Identification of a member of the MAPKKK family as a potential mediator of TGF- beta signal transduction. Science 270: 2008- 2011, 1995. ; and

[19350] Kondo, M.; Osada, H.; Uchida, K.; Yanagisawa, K.; Masuda, A.; Takagi, K.; Takahashi, T.; Takahashi, T. : Molecular cloning of human TAK1 and its mutational analysis in human lung cancer.

[19351] Further studies establishing the function and utilities of MAP3K7 are found in John Hopkins OMIM database record ID 602614, and in cited publications listed in Table 5, which are hereby incorporated by reference.MAPKBP1 (Accession XP_031706.7) is another GAM116 target gene, herein designated TARGET GENE. MAPKBP1 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by MAPKBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAPKBP1 BINDING SITE, designated SEQ ID:19619, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19352] Another function of GAM116 is therefore inhibition of MAPKBP1 (Accession XP_031706.7) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKBP1.

[19353] Myeloid cell leukemia sequence 1 (bcl2-related) (MCL1, Accession NP_068779.1) is another GAM116 target gene, herein designated TARGET GENE. MCL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:3273, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:301.

[19354] Another function of GAM116 is therefore inhibition of Myeloid cell leukemia sequence 1 (bcl2-related) (MCL1, Accession NP_068779.1), a gene which involved in programing of differentiation and concomitant maintenance of viability. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1.

[19355] The function of MCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.1.Myod family inhibitor (MDFI, Accession NP_005577.1) is another GAM116 target gene, herein designated TARGET GENE. MDFI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MDFI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MDFI BINDING SITE, designated SEQ ID:7809, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19356] Another function of GAM116 is therefore inhibition of Myod family inhibitor (MDFI, Accession NP_005577.1), a

gene which MyoD family inhibitor; interacts with and inhibits the MyoD family of transactivators. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDFI.

[19357] The function of MDFI has been established by previous studies. During embryogenesis, cells from the ventral and dorsal parts of the somites give rise to sclerotome and dermomyotome, respectively. The latter contains skeletal muscle precursors determined by the MyoD (OMIM Ref. No. 159970) family of myogenic factors. Chen et al. (1996) isolated a mouse cDNA encoding an inhibitor of MyoD, Mdfi, which they termed I- mf. Mdfi is highly expressed in the sclerotome, whereas MyoD family members are concentrated in the dermomyotome. Functional analysis showed that Mdfi inhibits the transactivation activity of MyoD family members and represses myogenesis. Immunofluorescence microscopy revealed that Mdfi associates with MyoD family members in the cytoplasm and retains them by masking their nuclear localization signals. Kraut et al. (1998) found that Mdfi negatively regulates a subset of basic helix- loop- helix proteins, thereby influencing trophoblast and chondrogenic differentiation. The

International Radiation Hybrid Mapping Consortium mapped the MDFI gene to chromosome 6 (stSG4448). Kraut (1997) reported that the MDFI gene maps to chromosome 6p21. By interspecific backcross analysis, Kraut (1997) mapped the mouse Mdfi gene to the central region of chromosome 17.

[19358]

[19359] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19360] Chen, C. M.; Kraut, N.; Groudine, M.; Weintraub, H. : I- mf, a novel myogenic repressor, interacts with members of the MyoD family. Cell 86: 731- 741, 1996. ; and

[19361] Kraut, N. : The gene encoding I- mf (Mdfi) maps to human chromosome 6p21 and mouse chromosome 17. Mammalian Genome 8: 618- 619, 1997.

[19362] Further studies establishing the function and utilities of MDFI are found in John Hopkins OMIM database record ID 604971, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC12458 (Accession NP_115704.1) is another GAM116 target gene, herein designated TARGET GENE. MGC12458 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by MGC12458, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12458 BINDING SITE, designated SEQ ID:11264, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19363] Another function of GAM116 is therefore inhibition of MGC12458 (Accession NP_115704.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12458.

[19364] MGC12904 (Accession NP_112496.1) is another GAM116 target gene, herein designated TARGET GENE. MGC12904 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC12904, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12904 BINDING SITE, designated SEQ ID:2673, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19365] Another function of GAM116 is therefore inhibition of

MGC12904 (Accession NP_112496.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12904.

[19366] MGC14801 (Accession NP_116094.1) is another GAM116 target gene, herein designated TARGET GENE. MGC14801 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14801, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14801 BINDING SITE, designated SEQ ID:7422, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19367] Another function of GAM116 is therefore inhibition of MGC14801 (Accession NP_116094.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14801.

[19368] MGC15606 (Accession NP_659474.1) is another GAM116 target gene, herein designated TARGET GENE. MGC15606 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15606, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15606 BINDING SITE, designated SEQ ID:5629, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19369] Another function of GAM116 is therefore inhibition of MGC15606 (Accession NP_659474.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15606.

[19370] MGC15937 (Accession NP_542392.2) is another GAM116 target gene, herein designated TARGET GENE. MGC15937 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15937, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15937 BINDING SITE, designated SEQ ID:12915, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19371] Another function of GAM116 is therefore inhibition of MGC15937 (Accession NP_542392.2) . Accordingly, utili-

ties of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15937.

[19372] MGC23166 (Accession NP_689948.1) is another GAM116 target gene, herein designated TARGET GENE. MGC23166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC23166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC23166 BINDING SITE, designated SEQ ID:16537, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19373] Another function of GAM116 is therefore inhibition of MGC23166 (Accession NP_689948.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23166.

[19374] MGC24995 (Accession NP_714914.1) is another GAM116 target gene, herein designated TARGET GENE. MGC24995 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC24995, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC24995 BINDING SITE, designated SEQ ID:10667, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19375] Another function of GAM116 is therefore inhibition of MGC24995 (Accession NP_714914.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC24995.

[19376] MGC26710 (Accession NP_689723.1) is another GAM116 target gene, herein designated TARGET GENE. MGC26710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC26710, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC26710 BINDING SITE, designated SEQ ID:8483, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19377] Another function of GAM116 is therefore inhibition of MGC26710 (Accession NP_689723.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC26710.

[19378] MGC39696 (Accession NP_689984.1) is another GAM116 target gene, herein designated TARGET GENE. MGC39696 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC39696, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39696 BINDING SITE, designated SEQ ID:9234, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19379] Another function of GAM116 is therefore inhibition of MGC39696 (Accession NP_689984.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39696.

[19380] MGC45866 (Accession NP_689472.2) is another GAM116 target gene, herein designated TARGET GENE. MGC45866 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC45866, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC45866 BINDING SITE, designated SEQ ID:14643, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19381] Another function of GAM116 is therefore inhibition of MGC45866 (Accession NP_689472.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC45866.

[19382] MGC46732 (Accession NP_714925.1) is another GAM116 target gene, herein designated TARGET GENE. MGC46732 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC46732, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC46732 BINDING SITE, designated SEQ ID:10690, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19383] Another function of GAM116 is therefore inhibition of MGC46732 (Accession NP_714925.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC46732.

[19384] MGC48332 (Accession NP_848545.1) is another GAM116 target gene, herein designated TARGET GENE. MGC48332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC48332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC48332 BINDING SITE, designated SEQ ID:18723, to

the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19385] Another function of GAM116 is therefore inhibition of MGC48332 (Accession NP_848545.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC48332.

[19386] MGC5442 (Accession NP_113622.1) is another GAM116 target gene, herein designated TARGET GENE. MGC5442 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC5442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC5442 BINDING SITE, designated SEQ ID:18618, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19387] Another function of GAM116 is therefore inhibition of MGC5442 (Accession NP_113622.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5442.

[19388] MGC57211 (Accession NP_787074.1) is another GAM116

target gene, herein designated TARGET GENE. MGC57211 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC57211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC57211 BINDING SITE, designated SEQ ID:18590, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19389] Another function of GAM116 is therefore inhibition of MGC57211 (Accession NP_787074.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC57211.

[19390] MGC7036 (Accession NP_659495.1) is another GAM116 target gene, herein designated TARGET GENE. MGC7036 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC7036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC7036 BINDING SITE, designated SEQ ID:5133, to the nucleotide sequence of GAM116 RNA, herein designated

GAM RNA, also designated SEQ ID:301.

[19391] Another function of GAM116 is therefore inhibition of MGC7036 (Accession NP_659495.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC7036.

[19392] Max binding protein (MNT, Accession NP_064706.1) is another GAM116 target gene, herein designated TARGET GENE. MNT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MNT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:6137, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19393] Another function of GAM116 is therefore inhibition of Max binding protein (MNT, Accession NP_064706.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT.

[19394] Myotubularin related protein 4 (MTMR4, Accession NP_004678.2) is another GAM116 target gene, herein

designated TARGET GENE. MTMR4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTMR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTMR4 BINDING SITE, designated SEQ ID:6995, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19395] Another function of GAM116 is therefore inhibition of Myotubularin related protein 4 (MTMR4, Accession NP_004678.2), a gene which could be involved in a signal transduction pathway necessary for late myogenesis. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR4.

[19396] The function of MTMR4 has been established by previous studies. Zhao et al. (2001) showed that MTMR4 dephosphorylates para- nitrophenylphosphate and phosphatidylinositol 3- phosphate.

[19397]

[19398] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[19399] Laporte, J.; Blondeau, F.; Buj- Bello, A.; Tentler, D.; Kretz, C.; Dahl, N.; Mandel, J.- L. : Characterization of the myotubularin dual specificity phosphatase gene family from yeast to human. Hum. Molec. Genet. 7: 1703- 1712, 1998. ; and

[19400] Zhao, R.; Qi, Y.; Chen, J.; Zhao, Z. J. : FYVE- DSP2, a FYVE domain- containing dual specificity protein phosphatase that dephosphorylates phosphotidylinositol (sic) 3- phosphate. Exp. Cel.

[19401] Further studies establishing the function and utilities of MTMR4 are found in John Hopkins OMIM database record ID 603559, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myoneurin (MYNN, Accession NP_061127.1) is another GAM116 target gene, herein designated TARGET GENE. MYNN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MYNN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYNN BINDING SITE, designated SEQ ID:18472, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA,

also designated SEQ ID:301.

[19402] Another function of GAM116 is therefore inhibition of Myoneurin (MYNN, Accession NP_061127.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYNN.

[19403] Neuron navigator 3 (NAV3, Accession NP_055718.2) is another GAM116 target gene, herein designated TARGET GENE. NAV3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NAV3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAV3 BINDING SITE, designated SEQ ID:11894, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19404] Another function of GAM116 is therefore inhibition of Neuron navigator 3 (NAV3, Accession NP_055718.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV3.

[19405] Nuclear factor of kappa light polypeptide gene enhancer in b-cells inhibitor, epsilon (NFKBIE, Accession

NP_004547.1) is another GAM116 target gene, herein designated TARGET GENE. NFKBIE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NFKBIE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFKBIE BINDING SITE, designated SEQ ID:6706, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19406] Another function of GAM116 is therefore inhibition of Nuclear factor of kappa light polypeptide gene enhancer in b-cells inhibitor, epsilon (NFKBIE, Accession NP_004547.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFKBIE.

[19407] Nerve growth factor receptor (tnfr superfamily, member 16) (NGFR, Accession NP_002498.1) is another GAM116 target gene, herein designated TARGET GENE. NGFR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NGFR BIND-

ING SITE, designated SEQ ID:774, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19408] Another function of GAM116 is therefore inhibition of Nerve growth factor receptor (tnfr superfamily, member 16) (NGFR, Accession NP_002498.1), a gene which can mediate cell survival as well as cell death of neural cells. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR.

[19409] The function of NGFR has been established by previous studies. Bothwell (1996), Carter and Lewin (1997), and Bibel and Barde (2000) reviewed neurotrophins and their receptors. Nerve growth factor receptor (NGFR) is also referred to as p75(NTR) due to its molecular mass and its ability to bind at low affinity not only NGF (see OMIM Ref. No. 162030), but also other neurotrophins, including brain- derived neurotrophic factor (BDNF; 113505), neurotrophin- 3 (NTF3; 162660), and neurotrophin- 4/5 (NTF5; 162662). At the time of its discovery, NGFR was considered a unique type of protein. Subsequently, however, a large superfamily of tumor necrosis factor receptors were found to share the overall structure of NGFR (4

extracellular ligand- binding, cysteine- rich repeats, or CRs, and signaling through association with, or disassociation from, cytoplasmic interactors). The identification of this superfamily helped elucidate some of the biologic functions of NGFR, including its ultimate involvement in the nuclear factor kappa- B (NFKB; OMIM Ref. No. 164011) and apoptosis pathways. As a monomer, NGFR binds NGF with low affinity. Higher affinity binding is achieved by association with higher molecular mass, low- affinity neurotrophin receptors, namely the tropomyosin receptor kinases, TRKA (NTRK1; 191315), TRKB (NTRK2; 600456), and TRKC (NTRK3; 191316). TRKA, TRKB, and TRKC are specific for or 'preferred by' NGF, NTF5 and BDNF, and NTF3, respectively (Ip et al., 1993). NTF3 also binds to TRKA and TRKB, but with significantly lower affinity.

[19410] Animal model experiments lend further support to the function of NGFR. By targeted disruption of exon 3 of the Ngfr gene, which encodes CR2, CR3, and CR4, Lee et al. (1992) generated mice lacking functional Ngfr. The Ngfr -/- mice were viable and fertile but developed skin defects in all extremities as well as ulcers that were prone to secondary infection with loss of epidermis. Immunohistochemistry revealed a lack of calcitonin gene- related pep-

tide (CALCA; 114130)- and substance P (OMIM Ref. No. 162320)- expressing peripheral sensory nerve fibers. Mutant mice had a loss of heat sensitivity but no defects in innervation of the iris or salivary gland. Mice carrying a single copy of a human NGFR transgene did not have neuropeptide and sensory loss or the peripheral ulcers.

[19411] It is appreciated that the abovementioned animal model for NGFR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[19412] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19413] Bibel, M.; Barde, Y.- A. : Neurotrophins: key regulators of cell fate and cell shape in the vertebrate nervous system. Genes Dev. 14: 2919- 2937, 2000. ; and

[19414] Lee, K. F.; Li, E.; Huber, J.; Landis, S. C.; Sharpe, A. H.; Chao, M. V.; Jaenisch, R. : Targeted mutation of the gene encoding the low affinity NGF receptor p75 leads to deficits in t.

[19415] Further studies establishing the function and utilities of NGFR are found in John Hopkins OMIM database record ID 162010, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) is another GAM116 target gene, herein designated TARGET GENE. NIPSNAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NIPSNAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NIPSNAP1 BINDING SITE, designated SEQ ID:16570, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19416] Another function of GAM116 is therefore inhibition of Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIPSNAP1.

[19417] Nodal homolog (mouse) (NODAL, Accession NP_060525.2) is another GAM116 target gene, herein designated TARGET GENE. NODAL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NODAL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NODAL BINDING SITE, designated SEQ ID:3383, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19418] Another function of GAM116 is therefore inhibition of Nodal homolog (mouse) (NODAL, Accession NP_060525.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NODAL.

[19419] NRBF-2 (Accession NP_110386.1) is another GAM116 target gene, herein designated TARGET GENE. NRBF-2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NRBF-2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NRBF-2 BINDING SITE, designated SEQ ID:2507, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19420] Another function of GAM116 is therefore inhibition of NRBF-2 (Accession NP_110386.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRBF-2.

[19421] NUP210 (Accession NP_079199.2) is another GAM116 target gene, herein designated TARGET GENE. NUP210 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUP210, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP210 BINDING SITE, designated SEQ ID:7611, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19422] Another function of GAM116 is therefore inhibition of NUP210 (Accession NP_079199.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP210.

[19423] Oculocerebrorenal syndrome of lowe (OCRL, Accession NP_000267.2) is another GAM116 target gene, herein designated TARGET GENE. OCRL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OCRL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OCRL

BINDING SITE, designated SEQ ID:5246, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19424] Another function of GAM116 is therefore inhibition of Oculocerebrorenal syndrome of lowe (OCRL, Accession NP_000267.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCRL.

[19425] Oculocerebrorenal syndrome of lowe (OCRL, Accession NP_001578.2) is another GAM116 target gene, herein designated TARGET GENE. OCRL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OCRL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OCRL BINDING SITE, designated SEQ ID:5246, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19426] Another function of GAM116 is therefore inhibition of Oculocerebrorenal syndrome of lowe (OCRL, Accession NP_001578.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with OCRL.

[19427] Oncostatin m (OSM, Accession NP_065391.1) is another GAM116 target gene, herein designated TARGET GENE. OSM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OSM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSM BINDING SITE, designated SEQ ID:5982, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19428] Another function of GAM116 is therefore inhibition of Oncostatin m (OSM, Accession NP_065391.1), a gene which inhibits the proliferation of a number of tumor cell lines, caused an acute inflammatory reaction. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSM.

[19429] The function of OSM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.2.P101-PI3K (Accession NP_055123.1) is another GAM116 target gene, herein designated TARGET

GENE. P101-PI3K BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P101-PI3K, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P101-PI3K BINDING SITE, designated SEQ ID:16367, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19430] Another function of GAM116 is therefore inhibition of P101-PI3K (Accession NP_055123.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P101-PI3K.

[19431] P24B (Accession NP_031390.1) is another GAM116 target gene, herein designated TARGET GENE. P24B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P24B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P24B BINDING SITE, designated SEQ ID:5315, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:301.

[19432] Another function of GAM116 is therefore inhibition of P24B (Accession NP_031390.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P24B.

[19433] Platelet-activating factor acetylhydrolase 2, 40kda (PAFAH2, Accession NP_000428.2) is another GAM116 target gene, herein designated TARGET GENE. PAFAH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAFAH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAFAH2 BINDING SITE, designated SEQ ID:7764, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19434] Another function of GAM116 is therefore inhibition of Platelet-activating factor acetylhydrolase 2, 40kda (PAFAH2, Accession NP_000428.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH2.

[19435] PAIP2 (Accession NP_057564.2) is another GAM116 target

gene, herein designated TARGET GENE. PAIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAIP2 BINDING SITE, designated SEQ ID:13015, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19436] Another function of GAM116 is therefore inhibition of PAIP2 (Accession NP_057564.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAIP2.

[19437] Poly(a) polymerase gamma (PAPOLG, Accession NP_075045.2) is another GAM116 target gene, herein designated TARGET GENE. PAPOLG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAPOLG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAPOLG BINDING SITE, designated SEQ ID:2310, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:301.

[19438] Another function of GAM116 is therefore inhibition of Poly(a) polymerase gamma (PAPOLG, Accession NP_075045.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAPOLG.

[19439] PBXIP1 (Accession NP_065385.2) is another GAM116 target gene, herein designated TARGET GENE. PBXIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PBXIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PBXIP1 BINDING SITE, designated SEQ ID:11249, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19440] Another function of GAM116 is therefore inhibition of PBXIP1 (Accession NP_065385.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBXIP1.

[19441] Protocadherin 10 (PCDH10, Accession NP_116586.1) is another GAM116 target gene, herein designated TARGET GENE. PCDH10 BINDING SITE is a target binding site found

in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDH10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:10950, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19442] Another function of GAM116 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NP_116586.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10.

[19443] Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1) is another GAM116 target gene, herein designated TARGET GENE. PDE4B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PDE4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4B BINDING SITE, designated SEQ ID:13014, to the nucleotide sequence of GAM116

RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19444] Another function of GAM116 is therefore inhibition of Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1), a gene which may be involved in mediating central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti- inflammatory agents. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4B.

[19445] The function of PDE4B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Piggybac transposable element derived 5 (PGBD5, Accession NP_078830.2) is another GAM116 target gene, herein designated TARGET GENE. PGBD5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PGBD5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PGBD5 BINDING SITE, designated SEQ ID:19715, to the nucleotide

sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19446] Another function of GAM116 is therefore inhibition of Piggybac transposable element derived 5 (PGBD5, Accession NP_078830.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGBD5.

[19447] Phd finger protein 5a (PHF5A, Accession NP_116147.1) is another GAM116 target gene, herein designated TARGET GENE. PHF5A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PHF5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHF5A BINDING SITE, designated SEQ ID:8541, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19448] Another function of GAM116 is therefore inhibition of Phd finger protein 5a (PHF5A, Accession NP_116147.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF5A.

[19449] Phosphatidylinositol glycan, class f (PIGF, Accession

NP_775097.1) is another GAM116 target gene, herein designated TARGET GENE. PIGF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PIGF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIGF BINDING SITE, designated SEQ ID:15112, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19450] Another function of GAM116 is therefore inhibition of Phosphatidylinositol glycan, class f (PIGF, Accession NP_775097.1), a gene which is involved in gpi- anchor biosynthesis through the transfer of ethanolamine phosphate to the third mannose of gpi. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGF.

[19451] The function of PIGF has been established by previous studies. DNA damage and/or hyperproliferative signals activate wildtype p53 tumor suppressor protein (TP53; 191170), inducing cell cycle arrest or apoptosis. Mutations that inactivate p53 occur in 50% of all tumors. Polyak et al. (1997) used serial analysis of gene expression

(SAGE) to evaluate cellular mRNA levels in a colorectal cancer cell line transfected with p53. Of 7,202 transcripts identified, only 14 were expressed at levels more than 10-fold higher in p53- expressing cells than in control cells. Polyak et al. (1997) termed these genes 'p53- induced genes,' or PIGs, several of which were predicted to encode redox- controlling proteins. They noted that reactive oxygen species (ROS) are potent inducers of apoptosis. Flow cytometric analysis showed that p53 expression induces ROS production, which increases as apoptosis progresses under some conditions. The authors stated that PIG8 is the human homolog of murine ei24, an etoposide- induced gene. Using a murine myeloid leukemia cell line expressing a temperature- sensitive p53 gene, Gu et al. (2000) showed that ei24, the murine homolog of PIG8, directly responds to p53 as an immediate- early response gene rather than as a secondary response to p53- mediated cell death. Electrophoretic mobility shift analysis demonstrated that purified wildtype p53 protein specifically binds to a p53 response element in the ei24 protein. By analysis of a BAC clone, Gu et al. (2000) determined that the PIG8 sequence reported by Polyak et al. (1997) is incorrect and that the corrected 358- amino acid PIG8

protein shares 98% amino acid identity with ei24. Western blot analysis indicated that ei24 expression is approximately 500- fold higher in dead cells than in healthy cells. Phase contrast and fluorescence microscopy showed that cells expressing Ei24 but not those coexpressing the apoptosis suppressor BCL2L1 (OMIM Ref. No. 600039) displayed the typical morphologic features of apoptosis. These results suggested that ei24 suppresses cell growth through the activation of an apoptotic pathway.

[19452]

[19453] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19454] Gu, Z.; Flemington, C.; Chittenden, T.; Zambetti, G. P. : Ei24, a p53 response gene involved in growth suppression and apoptosis. Molec. Cell. Biol. 20: 233- 241, 2000. ; and

[19455] Gu, Z.; Gilbert, D. J.; Valentine, V. A.; Jenkins, N. A.; Copeland, N. G.; Zambetti, G. P. : The p53- inducible gene EI24/PIG8 localizes to human chromosome 11q23 and the proximal region.

[19456] Further studies establishing the function and utilities of PIGF are found in John Hopkins OMIM database record ID

600153, and in cited publications listed in Table 5, which are hereby incorporated by reference.Peripheral myelin protein 22 (PMP22, Accession NP_696997.1) is another GAM116 target gene, herein designated TARGET GENE. PMP22 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PMP22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMP22 BINDING SITE, designated SEQ ID:14008, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19457] Another function of GAM116 is therefore inhibition of Peripheral myelin protein 22 (PMP22, Accession NP_696997.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMP22.

[19458] Peripheral myelin protein 22 (PMP22, Accession NP_696996.1) is another GAM116 target gene, herein designated TARGET GENE. PMP22 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PMP22, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMP22 BINDING SITE, designated SEQ ID:14008, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19459] Another function of GAM116 is therefore inhibition of Peripheral myelin protein 22 (PMP22, Accession NP_696996.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMP22.

[19460] Peripheral myelin protein 22 (PMP22, Accession NP_000295.1) is another GAM116 target gene, herein designated TARGET GENE. PMP22 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PMP22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMP22 BINDING SITE, designated SEQ ID:14008, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19461] Another function of GAM116 is therefore inhibition of Pe-

ripheral myelin protein 22 (PMP22, Accession NP_000295.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMP22.

[19462] Prion protein 2 (dublet) (PRND, Accession NP_036541.1) is another GAM116 target gene, herein designated TARGET GENE. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRND BINDING SITE, designated SEQ ID:18816, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19463] Another function of GAM116 is therefore inhibition of Prion protein 2 (dublet) (PRND, Accession NP_036541.1), a gene which is similar to prion protein PRNP. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRND.

[19464] The function of PRND has been established by previous studies. Lu et al. (2000) characterized the expression and structure of DPL by matrix- assisted laser desorption ion-

ization (MALDI) mass spectrometry and electrospray mass spectrometry. Unlike PRP, DPL has a second disulfide bond that may contribute to the stability of its uniquely folded alpha- helical core. Lu et al. (2000) noted that PRP is most highly expressed in brain, whereas DPL is enriched in testis. Biochemical analysis determined that DPL resembles PRP in terms of solubility and protease sensitivity and undergoes cooperative and reversible unfolding during thermal denaturation. Silverman et al. (2000) showed that recombinant Dpl refolded under standard conditions adopts an alpha- helical conformation. When expressed in mouse neuroblastoma cells, Dpl possessed 2 N- linked oligosaccharides and was attached to the cell surface via a GPI anchor, much like the cellular prion protein. Dpl was present in brain samples of Rcm0 mice, which develop progressive ataxia with loss of Purkinje cells at around 70 weeks of age, but was absent in equivalent samples from asymptomatic Zurich and wildtype mice. Schroder et al. (2001) investigated whether there are any polymorphisms within the PRND gene that might cause or be involved in the development of transmissible spongiform encephalopathies. They screened the complete open reading frame of the human gene from 58 patients who had died

of genetic or sporadic Creutzfeldt- Jakob disease (CJD; 123400), Alzheimer disease (OMIM Ref. No. 104300), or other neurologic disorders, and from 111 controls. They found 5 novel polymorphisms and 1 frameshift mutation. One silent polymorphism, which did not lead to an altered amino acid sequence, was also observed. Statistical analysis revealed a significant difference in the distribution of the PRND genotype at codon 174 between sporadic CJD patients and healthy controls. Like other investigators, they found no evidence that the strong association between sporadic CJD and the PRNP polymorphism at codon 129 (176640.0005) is influenced by different PRND genotypes.

[19465]

[19466] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19467] Comincini, S.; Foti, M. G.; Tranulis, M. A.; Hills, D.; Di Guardo, G.; Vaccari, G.; Williams, J. L.; Harbitz, I., Ferretti, L. : Genomic organization, comparative analysis, and genetic polymorphisms of the bovine and ovine prion Doppel genes (PRND). Mammalian Genome 12: 729- 733, 2001. ; and

[19468] Lu, K.; Wang, W.; Xie, Z.; Wong, B.- S.; Li, R.; Petersen, R. B.; Sy, M.- S.; Chen, S. G. : Expression and structural characterization of the recombinant human doppel protein. Biochemistr.

[19469] Further studies establishing the function and utilities of PRND are found in John Hopkins OMIM database record ID 604263, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRO0461 (Accession NP_112558.1) is another GAM116 target gene, herein designated TARGET GENE. PRO0461 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0461 BINDING SITE, designated SEQ ID:5461, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19470] Another function of GAM116 is therefore inhibition of PRO0461 (Accession NP_112558.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0461.

[19471] PRO2214 (Accession NP_060987.1) is another GAM116 target gene, herein designated TARGET GENE. PRO2214 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO2214, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2214 BINDING SITE, designated SEQ ID:15420, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19472] Another function of GAM116 is therefore inhibition of PRO2214 (Accession NP_060987.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2214.

[19473] Protein z, vitamin k-dependent plasma glycoprotein (PROZ, Accession NP_003882.1) is another GAM116 target gene, herein designated TARGET GENE. PROZ BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PROZ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PROZ BIND-

ING SITE, designated SEQ ID:4273, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19474] Another function of GAM116 is therefore inhibition of Protein z, vitamin k-dependent plasma glycoprotein (PROZ, Accession NP_003882.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROZ.

[19475] Prp4 pre-mrna processing factor 4 homolog b (yeast) (PRPF4B, Accession NP_003904.2) is another GAM116 target gene, herein designated TARGET GENE. PRPF4B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRPF4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRPF4B BINDING SITE, designated SEQ ID:18328, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19476] Another function of GAM116 is therefore inhibition of Prp4 pre-mrna processing factor 4 homolog b (yeast) (PRPF4B, Accession NP_003904.2) . Accordingly, utilities

of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF4B.

[19477] Protein tyrosine phosphatase, receptor type, f (PTPRF, Accession NP_569707.1) is another GAM116 target gene, herein designated TARGET GENE. PTPRF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPRF BINDING SITE, designated SEQ ID:2806, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19478] Another function of GAM116 is therefore inhibition of Protein tyrosine phosphatase, receptor type, f (PTPRF, Accession NP_569707.1), a gene which negatively regulates the insulin signaling pathway. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRF.

[19479] The function of PTPRF has been established by previous studies. The LAR gene (symbolized PTPRF) encodes a membrane protein that has a cytoplasmic domain with homology to protein- tyrosine phosphatase 1B (OMIM Ref.

No. 176885) and an extracellular domain homologous to the neural cellular adhesion molecule NCAM (OMIM Ref. No. 116930). The human LAR molecule closely resembles cell adhesion molecules, which suggests that it may be involved in the regulation of phosphotyrosine levels through cell- cell or cell- matrix interactions. As a first step toward site- directed mutagenesis studies of LAR function, Schaapveld et al. (1995) characterized the mouse Ptprf gene. They found that its cytoplasmic region is encoded by 11 exons that span only 4.5 kb of genomic DNA. Compared to the known exon- intron structures of other mammalian receptor- like protein tyrosine phosphatase genes such as Ptpra (encoding LRP; 176884) and Ptprc (coding for Ly- 5; 151460), the portion of the Ptprf gene encoding the cytoplasmic region of murine LAR contained not only smaller, but also fewer introns. O'Grady et al. (1994) demonstrated that the human LAR gene is composed of 33 exons spanning over 85 kb. Exon 2 encodes the signal sequence and the first 4 amino acids in the mature LAR protein. The 3 immunoglobulin- like domains are encoded by exons 3 to 7, and the 8 fibronectin type III (OMIM Ref. No. FN- III) domains by exons 8 to 17. Exons 18 to 22 encode the juxtamembrane and transmembrane

domains, and exons 23 to 33 encode the 2 conserved tyrosine phosphatase domains and the entire 3- prime untranslated region. Alternative splicing of LAR mRNA was revealed by RT- PCR analysis.

[19480]

[19481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19482] Schaapveld, R. Q. J.; van den Maagdenberg, A. M. J. M.; Schepens, J. T. G.; Olde Weghuis, D.; Geurts van Kessel, A.; Wieringa, B.; Hendriks, W. J. A. J. : The mouse gene Ptprf encoding the leukocyte common antigen- related molecule LAR: cloning, characterization, and chromosomal localization. Genomics 27: 124- 130, 1995. ; and

[19483] O'Grady, P.; Krueger, N. X.; Streuli, M.; Saito, H. : Genomic organization of the human LAR protein tyrosine phosphatase gene and alternative splicing in the extracellular fibronectin ty.

[19484] Further studies establishing the function and utilities of PTPRF are found in John Hopkins OMIM database record ID 179590, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein tyrosine phosphatase, receptor type, f (PTPRF, Accession

NP_002831.1) is another GAM116 target gene, herein designated TARGET GENE. PTPRF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPRF BINDING SITE, designated SEQ ID:2806, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19485] Another function of GAM116 is therefore inhibition of Protein tyrosine phosphatase, receptor type, f (PTPRF, Accession NP_002831.1), a gene which negatively regulates the insulin signaling pathway. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRF.

[19486] The function of PTPRF has been established by previous studies. The LAR gene (symbolized PTPRF) encodes a membrane protein that has a cytoplasmic domain with homology to protein- tyrosine phosphatase 1B (OMIM Ref. No. 176885) and an extracellular domain homologous to the neural cellular adhesion molecule NCAM (OMIM Ref. No. 116930). The human LAR molecule closely resembles

cell adhesion molecules, which suggests that it may be involved in the regulation of phosphotyrosine levels through cell- cell or cell- matrix interactions. As a first step toward site- directed mutagenesis studies of LAR function, Schaapveld et al. (1995) characterized the mouse Ptprf gene. They found that its cytoplasmic region is encoded by 11 exons that span only 4.5 kb of genomic DNA. Compared to the known exon- intron structures of other mammalian receptor- like protein tyrosine phosphatase genes such as Ptpra (encoding LRP; 176884) and Ptprc (coding for Ly- 5; 151460), the portion of the Ptprf gene encoding the cytoplasmic region of murine LAR contained not only smaller, but also fewer introns. O'Grady et al. (1994) demonstrated that the human LAR gene is composed of 33 exons spanning over 85 kb. Exon 2 encodes the signal sequence and the first 4 amino acids in the mature LAR protein. The 3 immunoglobulin- like domains are encoded by exons 3 to 7, and the 8 fibronectin type III (OMIM Ref. No. FN- III) domains by exons 8 to 17. Exons 18 to 22 encode the juxtamembrane and transmembrane domains, and exons 23 to 33 encode the 2 conserved tyrosine phosphatase domains and the entire 3- prime untranslated region. Alternative splicing of LAR mRNA was

revealed by RT- PCR analysis.

[19487]

[19488] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19489] Schaapveld, R. Q. J.; van den Maagdenberg, A. M. J. M.; Schepens, J. T. G.; Olde Weghuis, D.; Geurts van Kessel, A.; Wieringa, B.; Hendriks, W. J. A. J. : The mouse gene Pt-prf encoding the leukocyte common antigen- related molecule LAR: cloning, characterization, and chromosomal localization. Genomics 27: 124- 130, 1995. ; and

[19490] O'Grady, P.; Krueger, N. X.; Streuli, M.; Saito, H. : Genomic organization of the human LAR protein tyrosine phosphatase gene and alternative splicing in the extracellular fibronectin ty.

[19491] Further studies establishing the function and utilities of PTPRF are found in John Hopkins OMIM database record ID 179590, and in cited publications listed in Table 5, which are hereby incorporated by reference.RAB9P40 (Accession NP_005824.1) is another GAM116 target gene, herein designated TARGET GENE. RAB9P40 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB9P40, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB9P40 BINDING SITE, designated SEQ ID:6382, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19492] Another function of GAM116 is therefore inhibition of RAB9P40 (Accession NP_005824.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB9P40.

[19493] Rap1b, member of ras oncogene family (RAP1B, Accession NP_056461.1) is another GAM116 target gene, herein designated TARGET GENE. RAP1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP1B BINDING SITE, designated SEQ ID:16170, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19494] Another function of GAM116 is therefore inhibition of

Rap1b, member of ras oncogene family (RAP1B, Accession NP_056461.1), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1B.

[19495] The function of RAP1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Regulator of g-protein signalling 17 (RGS17, Accession NP_036551.3) is another GAM116 target gene, herein designated TARGET GENE. RGS17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGS17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGS17 BINDING SITE, designated SEQ ID:16913, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19496] Another function of GAM116 is therefore inhibition of Regulator of g-protein signalling 17 (RGS17, Accession NP_036551.3) . Accordingly, utilities of GAM116 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS17.

[19497] Regulator of g-protein signalling 6 (RGS6, Accession NP_004287.3) is another GAM116 target gene, herein designated TARGET GENE. RGS6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGS6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGS6 BINDING SITE, designated SEQ ID:7127, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19498] Another function of GAM116 is therefore inhibition of Regulator of g-protein signalling 6 (RGS6, Accession NP_004287.3) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS6.

[19499] Ring finger protein 24 (RNF24, Accession NP_009150.1) is another GAM116 target gene, herein designated TARGET GENE. RNF24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:18774, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19500] Another function of GAM116 is therefore inhibition of Ring finger protein 24 (RNF24, Accession NP_009150.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24.

[19501] Ribosomal protein s24 (RPS24, Accession NP_148982.1) is another GAM116 target gene, herein designated TARGET GENE. RPS24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RPS24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPS24 BINDING SITE, designated SEQ ID:4670, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19502] Another function of GAM116 is therefore inhibition of Ribosomal protein s24 (RPS24, Accession NP_148982.1), a gene which is a component of the small 40S ribosomal

subunit. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS24.

[19503] The function of RPS24 has been established by previous studies. Eukaryotic ribosomes are composed of 4 RNA species (see OMIM Ref. No. 180450) and at least 80 proteins. Brown et al. (1990) isolated a human ribosomal protein gene encoding a predicted 133- amino acid protein by probing a fibrosarcoma cDNA library with a ribosomal protein gene from Chinese hamster. By comparing the in vitro translation product with S24 from purified ribosomes on 2- dimensional gels, Brown et al. (1990) showed that the gene encodes the 40S ribosomal subunit protein S24 (RPS24). Xu and Roufa (1996) reported that RPS24 is organized into 6 exons and is differentially spliced to yield 2 isoforms, S24a and S24c, that are present in varying ratios in different tissues. Jones et al. (1997) used PCR of radiation and somatic cell hybrid panels to map the RPS24 gene to 10q22- q23. Kenmochi et al. (1998) confirmed the RPS24 mapping assignment reported by Jones et al. (1997).

[19504]

[19505] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[19506] Xu, W.- B.; Roufa, D. J. : The gene encoding human ribosomal protein S24 and tissue- specific expression of differentially spliced mRNAs. Gene 169: 257- 262, 1996. ; and

[19507] Jones, A.- M.; Marzella, R.; Rocchi, M.; Hewitt, J. E. : Mapping of the human ribosomal small subunit protein gene RPS24 to the chromosome 10q22- q23 boundary. Genomics 39: 121- 122, 1997.

[19508] Further studies establishing the function and utilities of RPS24 are found in John Hopkins OMIM database record ID 602412, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ribosomal protein s24 (RPS24, Accession NP_001017.1) is another GAM116 target gene, herein designated TARGET GENE. RPS24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RPS24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPS24 BINDING SITE, designated SEQ ID:4670, to the nucleotide sequence of GAM116 RNA,

herein designated GAM RNA, also designated SEQ ID:301.

[19509] Another function of GAM116 is therefore inhibition of Ribosomal protein s24 (RPS24, Accession NP_001017.1), a gene which is a component of the small 40S ribosomal subunit. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS24.

[19510] The function of RPS24 has been established by previous studies. Eukaryotic ribosomes are composed of 4 RNA species (see OMIM Ref. No. 180450) and at least 80 proteins. Brown et al. (1990) isolated a human ribosomal protein gene encoding a predicted 133- amino acid protein by probing a fibrosarcoma cDNA library with a ribosomal protein gene from Chinese hamster. By comparing the in vitro translation product with S24 from purified ribosomes on 2- dimensional gels, Brown et al. (1990) showed that the gene encodes the 40S ribosomal subunit protein S24 (RPS24). Xu and Roufa (1996) reported that RPS24 is organized into 6 exons and is differentially spliced to yield 2 isoforms, S24a and S24c, that are present in varying ratios in different tissues. Jones et al. (1997) used PCR of radiation and somatic cell hybrid panels to map the RPS24 gene to 10q22- q23. Kenmochi et

al. (1998) confirmed the RPS24 mapping assignment reported by Jones et al. (1997).

[19511]

[19512] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19513] Xu, W.- B.; Roufa, D. J. : The gene encoding human ribosomal protein S24 and tissue- specific expression of differentially spliced mRNAs. Gene 169: 257- 262, 1996. ; and

[19514] Jones, A.- M.; Marzella, R.; Rocchi, M.; Hewitt, J. E. : Mapping of the human ribosomal small subunit protein gene RPS24 to the chromosome 10q22- q23 boundary. Genomics 39: 121- 122, 1997.

[19515] Further studies establishing the function and utilities of RPS24 are found in John Hopkins OMIM database record ID 602412, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sodium channel, voltage gated, type viii, alpha polypeptide (SCN8A, Accession NP_055006.1) is another GAM116 target gene, herein designated TARGET GENE. SCN8A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCN8A, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCN8A BINDING SITE, designated SEQ ID:8797, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19516] Another function of GAM116 is therefore inhibition of Sodium channel, voltage gated, type viii, alpha polypeptide (SCN8A, Accession NP_055006.1), a gene which is component of a brain voltage- gated sodium channel. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN8A.

[19517] The function of SCN8A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.SE57-1 (Accession NP_079490.1) is another GAM116 target gene, herein designated TARGET GENE. SE57-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SE57-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of SE57-1 BINDING SITE, designated SEQ ID:19416, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19518] Another function of GAM116 is therefore inhibition of SE57-1 (Accession NP_079490.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1.

[19519] Secreted frizzled-related protein 1 (SFRP1, Accession NP_003003.2) is another GAM116 target gene, herein designated TARGET GENE. SFRP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFRP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:12977, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19520] Another function of GAM116 is therefore inhibition of Secreted frizzled-related protein 1 (SFRP1, Accession NP_003003.2), a gene which is a receptor for wnt proteins that may have an anti- apoptotic function and therefore may be associated with Colorectal cancer, gastric cancer,

uterine leiomyomas. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Colorectal cancer, gastric cancer, uterine leiomyomas, and of other diseases and clinical conditions associated with SFRP1.

[19521] The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Sideroflexin 5 (SFXN5, Accession NP_653180.1) is another GAM116 target gene, herein designated TARGET GENE. SFXN5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFXN5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFXN5 BINDING SITE, designated SEQ ID:13244, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19522] Another function of GAM116 is therefore inhibition of Sideroflexin 5 (SFXN5, Accession NP_653180.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN5.

[19523] Solute carrier family 16 (monocarboxylic acid transporters), member 10 (SLC16A10, Accession NP_061063.2) is another GAM116 target gene, herein designated TARGET GENE. SLC16A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC16A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC16A10 BINDING SITE, designated SEQ ID:1239, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19524] Another function of GAM116 is therefore inhibition of Solute carrier family 16 (monocarboxylic acid transporters), member 10 (SLC16A10, Accession NP_061063.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A10.

[19525] Solute carrier family 22 (organic anion/cation transporter), member 12 (SLC22A12, Accession NP_653186.2) is another GAM116 target gene, herein designated TARGET GENE. SLC22A12 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SLC22A12, corresponding to a tar-

get binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC22A12 BINDING SITE, designated SEQ ID:3144, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19526] Another function of GAM116 is therefore inhibition of Solute carrier family 22 (organic anion/cation transporter), member 12 (SLC22A12, Accession NP_653186.2), a gene which is a urate - anion exchanger regulating blood yrate levels and therefore may be associated with Renal hypouricemia. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Renal hypouricemia, and of other diseases and clinical conditions associated with SLC22A12.

[19527] The function of SLC22A12 has been established by previous studies. Enomoto et al. (2002) isolated a SLC22A12 cDNA from a human kidney cDNA library. The cDNA, which they called URAT1 for 'urate transporter- 1,' corresponds to a gene of 2,642 basepairs encoding a protein of 555 amino acids, which they called URAT1 for 'urate transporter- 1,' that is 42% identical to OAT4 (OMIM Ref. No. 607097). The hydropathy plot predicts 12 membrane-

spanning domains in URAT1, which are similar to those in members of the OAT family. URAT1 has 3 consensus sequences for N- glycosylation and 2 cyclic AMP- dependent protein kinase phosphorylation sites. High stringency Northern analysis revealed predominant expression of URAT1 mRNA in the human adult and fetal kidney, and immunohistochemical analysis revealed that URAT1 protein is prominent in epithelial cells of the proximal tubule of the renal cortex. Under high magnification, the protein was found to be located in the luminal membrane of the epithelium of proximal tubules but not in that of distal tubules Enomoto et al. (2002) demonstrated that Xenopus oocytes injected with URAT1 cRNA exhibited time- dependent transport activity of [14C]urate but not of various typical substrates of OATs or organic cation transporters. URAT1 was found to be a cotransporter with anions, in particular chloride, bromide, or iodine, but not fluoride. Enomoto et al. (2002) found that urate transport via URAT1 is inhibited selectively by organic anions such as lactate, nicotinate, acetoacetate, hydroxybutyrate, and succinate. Para- aminohippurate (PAH), the representative substrate of OATs, did not exert an inhibitory effect on urate uptake via URAT1, consistent with the observation

that PAH has no effect on the fractional excretion of urate in humans. Benzbromarone, probenecid, phenylbutazone, sulfinpyrazone, nonsteroidal antiinflammatory drugs, and diuretics inhibited urate uptake. Trans- stimulation experiments indicated that the major counteranions that exchange for urate via URAT1 are organic anions rather than inorganic chloride. Patients with renal hypouricemia (OMIM Ref. No. 220150) have mutations in URAT1.

[19528]

[19529] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19530] Enomoto, A.; Kimura, H.; Chairoungdua, A.; Shigeta, Y.; Jutabha, P.; Cha, S. H.; Hosoyamada, M.; Takeda, M.; Sekine, T.; Igarashi, T.; Matsuo, H.; Kikuchi, Y.; Oda, T.; Ichida, K.; Hosoya, T.; Shimokata, K.; Niwa, T.; Kanai, Y.; Endou, H. : Molecular identification of a renal urate- anion exchanger that regulates blood urate levels. Nature 417: 447- 452, 2002. ; and

[19532] Further studies establishing the function and utilities of SLC22A12 are found in John Hopkins OMIM database record ID 607096, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 22 (organic anion/cation transporter), member 12 (SLC22A12, Accession NP_700357.1) is another GAM116 target gene, herein designated TARGET GENE. SLC22A12 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SLC22A12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC22A12 BINDING SITE, designated SEQ ID:3144, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19533] Another function of GAM116 is therefore inhibition of Solute carrier family 22 (organic anion/cation transporter), member 12 (SLC22A12, Accession NP_700357.1), a gene which is a urate - anion exchanger regulating blood yrate levels and therefore may be associated with Renal hypouricemia. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Renal hypouricemia,

and of other diseases and clinical conditions associated with SLC22A12.

[19534] The function of SLC22A12 has been established by previous studies. Enomoto et al. (2002) isolated a SLC22A12 cDNA from a human kidney cDNA library. The cDNA, which they called URAT1 for 'urate transporter- 1,' corresponds to a gene of 2,642 basepairs encoding a protein of 555 amino acids, which they called URAT1 for 'urate transporter- 1,' that is 42% identical to OAT4 (OMIM Ref. No. 607097). The hydropathy plot predicts 12 membrane-spanning domains in URAT1, which are similar to those in members of the OAT family. URAT1 has 3 consensus sequences for N- glycosylation and 2 cyclic AMP- dependent protein kinase phosphorylation sites. High stringency Northern analysis revealed predominant expression of URAT1 mRNA in the human adult and fetal kidney, and immunohistochemical analysis revealed that URAT1 protein is prominent in epithelial cells of the proximal tubule of the renal cortex. Under high magnification, the protein was found to be located in the luminal membrane of the epithelium of proximal tubules but not in that of distal tubules Enomoto et al. (2002) demonstrated that Xenopus oocytes injected with URAT1 cRNA exhibited time- depen-

dent transport activity of [14C]urate but not of various typical substrates of OATs or organic cation transporters. URAT1 was found to be a cotransporter with anions, in particular chloride, bromide, or iodine, but not fluoride. Enomoto et al. (2002) found that urate transport via URAT1 is inhibited selectively by organic anions such as lactate, nicotinate, acetoacetate, hydroxybutyrate, and succinate. Para- aminohippurate (PAH), the representative substrate of OATs, did not exert an inhibitory effect on urate uptake via URAT1, consistent with the observation that PAH has no effect on the fractional excretion of urate in humans. Benzbromarone, probenecid, phenylbutazone, sulfinpyrazone, nonsteroidal antiinflammatory drugs, and diuretics inhibited urate uptake. Trans- stimulation experiments indicated that the major counteranions that exchange for urate via URAT1 are organic anions rather than inorganic chloride. Patients with renal hypouricemia (OMIM Ref. No. 220150) have mutations in URAT1.

[19536] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19537] Enomoto, A.; Kimura, H.; Chairoungdua, A.; Shigeta, Y.;

Jutabha, P.; Cha, S. H.; Hosoyamada, M.; Takeda, M.; Sekine, T.; Igarashi, T.; Matsuo, H.; Kikuchi, Y.; Oda, T.; Ichida, K.; Hosoya, T.; Shimokata, K.; Niwa, T.; Kanai, Y.; Endou, H. : Molecular identification of a renal urate- anion exchanger that regulates blood urate levels. Nature 417: 447- 452, 2002. ; and

[19538] Enomoto, A.; Kimura, H.; Chairoungdua, A.; Shigeta, Y.; Jutabha, P.; Cha, S. H.; Hosoyamada, M.; Takeda, M.; Sekine, T.; Igarashi, T.; Matsuo, H.; Kikuchi, Y.; Oda, T.; Ichida, K.; Hosoya.

[19539] Further studies establishing the function and utilities of SLC22A12 are found in John Hopkins OMIM database record ID 607096, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 9 (sodium/hydrogen exchanger), isoform 3 regulatory factor 1 (SLC9A3R1, Accession NP_004243.1) is another GAM116 target gene, herein designated TARGET GENE. SLC9A3R1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC9A3R1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC9A3R1 BINDING SITE, designated

SEQ ID:11349, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19540] Another function of GAM116 is therefore inhibition of Solute carrier family 9 (sodium/hydrogen exchanger), isoform 3 regulatory factor 1 (SLC9A3R1, Accession NP_004243.1), a gene which is the regulatory cofactor of the NHE3 (SLC9A3) sodium/hydrogen antiporter. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A3R1.

[19541] The function of SLC9A3R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Sorbitol dehydrogenase (SORD, Accession NP_003095.1) is another GAM116 target gene, herein designated TARGET GENE. SORD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SORD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SORD BINDING SITE, designated SEQ ID:10531, to the nucleotide sequence of GAM116

RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19542] Another function of GAM116 is therefore inhibition of Sorbitol dehydrogenase (SORD, Accession NP_003095.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORD.

[19543] Sry (sex determining region y)-box 1 (SOX1, Accession NP_005977.2) is another GAM116 target gene, herein designated TARGET GENE. SOX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX1 BINDING SITE, designated SEQ ID:17428, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19544] Another function of GAM116 is therefore inhibition of Sry (sex determining region y)-box 1 (SOX1, Accession NP_005977.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX1.

[19545] Sry (sex determining region y)-box 13 (SOX13, Accession NP_005677.1) is another GAM116 target gene, herein designated TARGET GENE. SOX13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:15099, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19546] Another function of GAM116 is therefore inhibition of Sry (sex determining region y)-box 13 (SOX13, Accession NP_005677.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX13.

[19547] Spermatogenesis associated 2 (SPATA2, Accession NP_006029.1) is another GAM116 target gene, herein designated TARGET GENE. SPATA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPATA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of SPATA2 BINDING SITE, designated SEQ ID:11422, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19548] Another function of GAM116 is therefore inhibition of Spermatogenesis associated 2 (SPATA2, Accession NP_006029.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPATA2.

[19549] Suppression of tumorigenicity 14 (colon carcinoma, matriptase, epithin) (ST14, Accession NP_068813.1) is another GAM116 target gene, herein designated TARGET GENE. ST14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ST14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST14 BINDING SITE, designated SEQ ID:14983, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19550] Another function of GAM116 is therefore inhibition of Suppression of tumorigenicity 14 (colon carcinoma, matriptase, epithin) (ST14, Accession NP_068813.1), a gene

which is proposed to play a role in breast cancer invasion and metastasis. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST14.

[19551] The function of ST14 has been established by previous studies. Lin et al. (1999) cloned an ST14 cDNA encoding a protease previously identified in breast cancer cells (Lin et al., 1997). The deduced 683- amino acid protein has a calculated molecular mass of 75.6 kD. It contains an integrin- binding site near the N terminus, 3 potential N- glycosylation sites, 4 tandem repeats homologous to the 35- amino acid cysteine- containing repeats of the LDL receptor, a putative proteolytic activation site, and a C- terminal region with similarity to the trypsin- like serine proteases. Lin et al. (1999) purified ST14 in a 95- kD complex with a 40- kD binding protein identified as SPINT1 (OMIM Ref. No. 605123), a Kunitz- type serine protease inhibitor. They found that ST14 is secreted from breast cancer cells and localizes at the cell surface. Takeuchi et al. (1999) independently cloned ST14 as a protease associated with prostatic cancer tumor cells, using degenerate primers for a chymotrypsin active site as probe. Sequence analysis showed that ST14 lacks a signal sequence and is

likely to be a membrane- associated serine protease. By Northern blot analysis, they identified a 3.3- kb transcript in epithelial tissues including prostate, kidney, lung, small intestine, stomach, colon, and placenta, as well as in spleen, liver, leukocytes, and thymus. No expression was found in muscle, brain, ovary, or testis. Expression was also observed in a colorectal adenocarcinoma cell line, but not in several other cell lines tested. By Northern and Western blot analysis of normal breast and breast cancer cell lines, Oberst et al. (2001) found complete concordance in expression of ST14 and SPINT1; the expression correlated with expression of epithelial cell markers.

[19552]

[19553] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19554] Lin, C.- Y.; Anders, J.; Johnson, M.; Sang, Q. A.; Dickson, R. B. : Molecular cloning of cDNA for matriptase, a matrix-degrading serine protease with trypsin- like activity. J. Biol. Chem. 274: 18231- 18236, 1999. ; and

[19555] Takeuchi, T.; Shuman, M. A.; Craik, C. S. : Reverse biochemistry: use of macromolecular protease inhibitors to dissect complex biological processes and identify a mem-

brane- type serine.

[19556] Further studies establishing the function and utilities of ST14 are found in John Hopkins OMIM database record ID 606797, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tyrosyl-dna phosphodiesterase 1 (TDP1, Accession NP_060789.2) is another GAM116 target gene, herein designated TARGET GENE. TDP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TDP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TDP1 BINDING SITE, designated SEQ ID:14692, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19557] Another function of GAM116 is therefore inhibition of Tyrosyl-dna phosphodiesterase 1 (TDP1, Accession NP_060789.2) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDP1.

[19558] TEM1 (Accession NP_065137.1) is another GAM116 target gene, herein designated TARGET GENE. TEM1 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by TEM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TEM1 BINDING SITE, designated SEQ ID:14211, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19559] Another function of GAM116 is therefore inhibition of TEM1 (Accession NP_065137.1), a gene which involves in angiogenesis and therefore may be associated with Colorectal cancer. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of Colorectal cancer, and of other diseases and clinical conditions associated with TEM1.

[19560] The function of TEM1 has been established by previous studies. Endosialin, an antigen recognized by monoclonal antibody FB5, is expressed as a 165- kD cell surface glycoprotein on tumor blood vessel endothelium in several cancers, but is not detectable in normal tissue. By immunoaffinity and biochemical purification of endosialin from a neuroblastoma cell line, followed by microsequence analysis and EST database searching, Christian et al. (2001) isolated a full- length cDNA encoding en-

dosialin, which is identical to TEM1. Sequence analysis predicted that the 757- amino acid type I membrane protein contains a signal peptide; 5 globular extracellular domains, including a C- type lectin (see OMIM Ref. No. 605306) domain, a Sushi/SCR/CCP (see OMIM Ref. No. 300187) domain, and 3 EGF (OMIM Ref. No. 131530) repeats; a mucin (see OMIM Ref. No. 158340)- like region; a transmembrane segment; and a short cytoplasmic tail. Carbohydrate analysis indicated that the endosialin protein carries abundantly sialylated, O- linked oligosaccharides and is reduced to 120 kD by sialidase treatment or to 95 kD with additional O- glycanase treatment. The N-terminal 360 residues of endosialin are homologous to thrombomodulin (THBD; 188040) and complement component 1q receptor (OMIM Ref. No. 120577). Northern blot analysis revealed expression of a single 2.6- kb transcript in endosialin- expressing cell lines. Christian et al. (2001) noted that mice and rats have close homologs of the TEM1 gene. Carson- Walter et al. (2001) determined that TEM1 shares 77% amino acid identity with the mouse protein. Using in situ hybridization analysis of human colorectal cancer, Carson- Walter et al. (2001) demonstrated that TEM1 was expressed clearly in the endothelial cells of

the tumor stroma but not in the endothelial cells of normal colonic tissue. Mouse Tem1 was abundantly expressed in vessels infiltrating both mouse melanoma and human colon carcinoma cells implanted into mice. Using in situ hybridization to assay expression in various normal adult mouse tissues, Carson- Walter et al. (2001) detected only weak staining of endothelial cells in adrenal gland, brain, heart, intestine, lung, skeletal muscle, and pancreas. In embryos, they detected Tem1 in the vasculature of developing embryonic liver and brain.

[19561]

[19562] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19563] Christian, S.; Ahorn, H.; Koehler, A.; Eisenhaber, F.; Rodi, H.- P.; Garin- Chesa, P.; Park, J. E.; Rettig, W. J.; Lenter, M. C. : Molecular cloning and characterization of endosialin, a C- type lectin- like cell surface receptor of tumor endothelium. J. Biol. Chem. 276: 7408- 7414, 2001. ; and

[19565] Further studies establishing the function and utilities of TEM1 are found in John Hopkins OMIM database record ID 606064, and in cited publications listed in Table 5, which are hereby incorporated by reference.Thy-1 cell surface antigen (THY1, Accession NP_006279.2) is another GAM116 target gene, herein designated TARGET GENE. THY1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by THY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THY1 BINDING SITE, designated SEQ ID:13826, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19566] Another function of GAM116 is therefore inhibition of Thy-1 cell surface antigen (THY1, Accession NP_006279.2), a gene which plays a role in cell- cell or cell- ligand interactions during synaptogenesis. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THY1.

[19567] The function of THY1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM74.1.Torsin family 2, member a (TOR2A, Accession NP_569726.1) is another GAM116 target gene, herein designated TARGET GENE. TOR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TOR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TOR2A BINDING SITE, designated SEQ ID:12108, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19568] Another function of GAM116 is therefore inhibition of Torsin family 2, member a (TOR2A, Accession NP_569726.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOR2A.

[19569] Tnf receptor-associated factor 1 (TRAF1, Accession NP_005649.1) is another GAM116 target gene, herein designated TARGET GENE. TRAF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRAF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRAF1 BINDING SITE, designated SEQ ID:4417, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19570] Another function of GAM116 is therefore inhibition of Tnf receptor-associated factor 1 (TRAF1, Accession NP_005649.1), a gene which signal transducer associated with the cytoplasmic domain of the 75 kda tumor necrosis factor receptor (tnf- r2). Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF1.

[19571] The function of TRAF1 has been established by previous studies. In order to determine how tumor necrosis factor (TNF; 191160) elicits cellular response, factors that interact with the cytoplasmic domain of TNF receptor- 2 (TNFR2; 191191) were identified. Rothe et al. (1994) used the yeast- based 2- hybrid system to detect mouse proteins that interact with TNFR2. They identified and cloned 2 TNF receptor- associated factors, which they termed TRAF1 and TRAF2 (OMIM Ref. No. 601895). Each of the TRAFs contains a C- terminal TRAF domain of approximately 230 amino acids. TRAF1 and TRAF2 can form both homo- and heterodimers. Mosialos et al. (1995) identified

the human homolog of TRAF1 as Epstein- Barr virus (EBV)- induced mRNA 6 (EBI6), an mRNA that is more abundant in EBV- infected B lymphoblasts than in uninfected control cells. The predicted 416- amino acid human protein is 86% identical to mouse TRAF1. Both the human and mouse proteins contain N- terminal zinc finger motifs and C- terminal TRAF domains. Northern blot analysis revealed that the 2.6- kb EBI6 mRNA is expressed in lung, spleen, tonsil, and weakly in placenta. Mosialos et al. (1995) found that LMP1, the EBV- transforming protein, specifically associates with LAP1 (TRAF3) or EBI6 in B lymphoblasts. LMP1 expression redirects LAP1 and EBI6 from scattered cytoplasmic structures to LMP1 plasma membrane patches. Both LAP1 and EBI6 associated with the cytoplasmic domain of p80/TNFR2 in vivo. The authors stated that the interaction of LMP1 with the LAP1 and EBI6 TNFR- associated proteins is evidence for the role of these proteins in signaling, and links LMP1- mediated transformation to signal transduction from the TNFR family. The structural hallmark of signal- transducing proteins associated with members of the TNFR superfamily is a novel C- terminal homology region of 230 amino acids, designated the TRAF domain. This domain is in-

volved in a variety of specific protein- protein interactions. Siemienski et al. (1997) found that the human TRAF1 gene has a total length of approximately 12 kb. It is split into 6 exons, 4 of which encode parts of the TRAF domain. Analysis of the genomic structure of the TRAF domains of TRAF2 and TRAF3 (OMIM Ref. No. 601896) suggest that these domains are also encoded by several exons.

[19572] Animal model experiments lend further support to the function of TRAF1. Tsitsikov et al. (2001) generated Traf1 null mice. Although lymphocyte development was normal, T cells responded to anti- CD3 stimulation with enhanced proliferation. Through TNFR2, but not through TNFR1 (OMIM Ref. No. 191190), they also exhibited enhanced proliferation as well as NFKB (OMIM Ref. No. 164011) and AP1 activation. TNF- induced, lymphocyte- dependent skin necrosis occurred in Traf1 - /- mice at a suboptimal dose of the cytokine. Tsitsikov et al. (2001) concluded that TRAF1 negatively regulates TNFR2- mediated proliferation and NFKB activation

[19573] It is appreciated that the abovementioned animal model for TRAF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[19574] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19575] Siemienski, K.; Peters, N.; Scheurich, P.; Wajant, H. : Organization of the human tumour necrosis factor receptor-associated factor 1 (TRAF1) gene and mapping to chromosome 9q33- 34. Gene 195: 35- 39, 1997. ; and

[19576] Tsitsikov, E. N.; Laouini, D.; Dunn, I. F.; Sannikova, T. Y.; Davidson, L.; Alt, F. W.; Geha, R. S. : TRAF1 is a negative regulator of TNF signaling: enhanced TNF signaling in TRAF1- defi.

[19577] Further studies establishing the function and utilities of TRAF1 are found in John Hopkins OMIM database record ID 601711, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tripartite motif-containing 34 (TRIM34, Accession NP_569073.1) is another GAM116 target gene, herein designated TARGET GENE. TRIM34 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRIM34, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of TRIM34 BINDING SITE, designated SEQ ID:6774, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19578] Another function of GAM116 is therefore inhibition of Tripartite motif-containing 34 (TRIM34, Accession NP_569073.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM34.

[19579] TSC22 (Accession NP_006013.1) is another GAM116 target gene, herein designated TARGET GENE. TSC22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TSC22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TSC22 BINDING SITE, designated SEQ ID:16490, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19580] Another function of GAM116 is therefore inhibition of TSC22 (Accession NP_006013.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSC22.

[19581] Translin-associated factor x interacting protein 1 (TSNAXIP1, Accession NP_060900.1) is another GAM116 target gene, herein designated TARGET GENE. TSNAXIP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TSNAXIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TSNAXIP1 BINDING SITE, designated SEQ ID:19890, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19582] Another function of GAM116 is therefore inhibition of Translin-associated factor x interacting protein 1 (TSNAXIP1, Accession NP_060900.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSNAXIP1.

[19583] Vesicle transport through interaction with t-snares homolog 1b (yeast) (VTI1B, Accession NP_006361.1) is another GAM116 target gene, herein designated TARGET GENE. VTI1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VTI1B, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VTI1B BINDING SITE, designated SEQ ID:18660, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19584] Another function of GAM116 is therefore inhibition of Vesicle transport through interaction with t-snares homolog 1b (yeast) (VTI1B, Accession NP_006361.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VTI1B.

[19585] Wingless-type mmtv integration site family, member 5a (WNT5A, Accession NP_003383.1) is another GAM116 target gene, herein designated TARGET GENE. WNT5A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WNT5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WNT5A BINDING SITE, designated SEQ ID:13031, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19586] Another function of GAM116 is therefore inhibition of

Wingless-type mmtv integration site family, member 5a (WNT5A, Accession NP_003383.1), a gene which is a ligand for members of the frizzled family of seven transmembrane receptors and is probablely a developmental protein. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5A.

[19587] The function of WNT5A has been established by previous studies. The Wnt genes belong to a family of protooncogenes with at least 13 known members that are expressed in species ranging from Drosophila to man. The name Wnt denotes the relationship of this family to the Drosophila segment polarity gene 'wingless' and to its vertebrate ortholog, Int1, a mouse protooncogene (see OMIM Ref. No. 164820). Transcription of Wnt family genes appears to be developmentally regulated in a precise temporal and spatial manner. The Wnt family is considered to be 1 of the 3 major families of signaling molecules in the mouse, the others being the fibroblast growth factor- related family (see OMIM Ref. No. 164980) and the transforming growth factor- beta- related family (TGFB; 190180). Using degenerate PCR and cDNA library screening to search for mouse genes related to Wnt1, Gavin et al. (1990) identified 6 new

members of the Wnt gene family, including Wnt5a. The Wnt genes encode 38- to 43- kD cysteine- rich putative glycoproteins, which have features typical of secreted growth factors: a hydrophobic signal sequence and 21 conserved cysteine residues whose relative spacing is maintained. Northern blot analysis detected expression of Wnt5a in brain, lung, and heart. At least 5 distinct Wnt5a transcripts were observed, which Gavin et al. (1990) hypothesized were due to transcript variability 5- prime to the initiation methionine. In situ hybridization detected a complex spatial and temporal pattern of Wnt5a in the mouse, including expression in the developing central nervous system, limbs, facial processes, and the posterior region of the fetus. Clark et al. (1993) cloned and sequenced several overlapping cDNAs encoding approximately 4.1 kb of the human homolog of Wnt5A. Expression of the human gene, symbolized WNT5A, was detected only in neonatal heart and lung. He et al. (1997) showed that human frizzled- 5 (OMIM Ref. No. 601723) is the receptor for the Wnt5A ligand.

[19588]

[19589] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[19590] Gavin, B. J.; McMahon, J. A.; McMahon, A. P. : Expression of multiple novel Wnt- 1/int- 1- related genes during fetal and adult mouse development. Genes Dev. 4: 2319-2332, 1990. ; and

[19591] He, X.; Saint- Jeannet, J.- P.; Wang, Y.; Nathans, J.; Dawid, I.; Varmus, H. : A member of the frizzled protein family mediating axis induction by Wnt- 5A. Science 275: 1652-1654, 1997.

[19592] Further studies establishing the function and utilities of WNT5A are found in John Hopkins OMIM database record ID 164975, and in cited publications listed in Table 5, which are hereby incorporated by reference.XT3 (Accession NP_064593.1) is another GAM116 target gene, herein designated TARGET GENE. XT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by XT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:16618, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19593] Another function of GAM116 is therefore inhibition of XT3 (Accession NP_064593.1), a gene which is a Kidney- specific orphan transporter. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3.

[19594] The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.XT3 (Accession NP_071800.1) is another GAM116 target gene, herein designated TARGET GENE. XT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by XT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:16618, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19595] Another function of GAM116 is therefore inhibition of XT3 (Accession NP_071800.1), a gene which is a Kidney- specific orphan transporter. Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3.

[19596] The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Zinc finger protein 180 (hhz168) (ZNF180, Accession NP_037388.1) is another GAM116 target gene, herein designated TARGET GENE. ZNF180 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF180, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF180 BINDING SITE, designated SEQ ID:10372, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19597] Another function of GAM116 is therefore inhibition of Zinc finger protein 180 (hhz168) (ZNF180, Accession NP_037388.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF180.

[19598] Zinc finger protein 31 (kox 29) (ZNF31, Accession NP_660281.1) is another GAM116 target gene, herein designated TARGET GENE. ZNF31 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by ZNF31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF31 BINDING SITE, designated SEQ ID:9409, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19599] Another function of GAM116 is therefore inhibition of Zinc finger protein 31 (kox 29) (ZNF31, Accession NP_660281.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF31.

[19600] Zinc finger protein 323 (ZNF323, Accession NP_112161.2) is another GAM116 target gene, herein designated TARGET GENE. ZNF323 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:5822, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19601] Another function of GAM116 is therefore inhibition of Zinc finger protein 323 (ZNF323, Accession NP_112161.2) .

Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323.

[19602] Zinc finger protein 70 (cos17) (ZNF70, Accession NP_852101.1) is another GAM116 target gene, herein designated TARGET GENE. ZNF70 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF70, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF70 BINDING SITE, designated SEQ ID:2508, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19603] Another function of GAM116 is therefore inhibition of Zinc finger protein 70 (cos17) (ZNF70, Accession NP_852101.1) . Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF70.

[19604] Zinc finger protein 70 (cos17) (ZNF70, Accession NP_068735.1) is another GAM116 target gene, herein designated TARGET GENE. ZNF70 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by ZNF70, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF70 BINDING SITE, designated SEQ ID:2508, to the nucleotide sequence of GAM116 RNA, herein designated GAM RNA, also designated SEQ ID:301.

[19605] Another function of GAM116 is therefore inhibition of Zinc finger protein 70 (cos17) (ZNF70, Accession NP_068735.1). Accordingly, utilities of GAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF70.

[19606]

[19607] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 117 (GAM117), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19608] GAM117 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM117 was detected is described hereinabove with reference to Figs. 8-15.

[19609] GAM117 gene, herein designated GAM GENE, and GAM117 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19610] GAM117 gene encodes a GAM117 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM117 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM117 precursor RNA is designated SEQ ID:151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:151 is located at position 4744406 relative to chromosome 16.

[19611] GAM117 precursor RNA folds onto itself, forming GAM117 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19612] GAM117 precursor RNA folds onto itself, forming GAM117 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19613] Nucleotide sequence of GAM117 precursor RNA, designated SEQ-ID: 151, and a schematic representation of a predicted secondary folding of GAM117 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19614] An enzyme complex designated DICER COMPLEX, `dices` the GAM117 folded precursor RNA into GAM117 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM117 RNA is designated SEQ ID:216, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby in-

corporated by reference.

[19615] GAM117 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM117 target RNA, herein designated GAM TARGET RNA. GAM117 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19616] GAM117 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM117 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM117 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM117 RNA may have a different number of target binding sites in untranslated regions of a GAM117 target RNA. It is further appreciated that while Fig. 8 depicts tar-

get binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19617] The complementary binding of GAM117 RNA, herein designated GAM RNA, to target binding sites on GAM117 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM117 target RNA into GAM117 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19618] It is appreciated that GAM117 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM117 target genes. The mRNA of each one of this plurality of GAM117 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM117 RNA, herein designated GAM RNA, and which when bound by GAM117 RNA causes inhibition of translation of respective one or more GAM117 target proteins.

[19619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by

GAM117 gene, herein designated GAM GENE, on one or more GAM117 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19620] It is appreciated that specific functions and accordingly utilities of GAM117 correlate with, and may be deduced from, the identity of the target genes which GAM117 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19621]

[19622]

[19623] Chromosome 11 open reading frame 25 (C11orf25, Accession NM_031418.1) is a GAM117 target gene, herein

designated TARGET GENE. C11orf25 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C11orf25, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:11610, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19624] A function of GAM117 is therefore inhibition of Chromosome 11 open reading frame 25 (C11orf25, Accession NM_031418.1) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25.

[19625] Chromosome 14 open reading frame 4 (C14orf4, Accession XM_041104.8) is another GAM117 target gene, herein designated TARGET GENE. C14orf4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C14orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf4 BINDING SITE, designated SEQ ID:14295, to the nucleotide se-

quence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19626] Another function of GAM117 is therefore inhibition of Chromosome 14 open reading frame 4 (C14orf4, Accession XM_041104.8) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf4.

[19627] ELL (Accession NM_006532.1) is another GAM117 target gene, herein designated TARGET GENE. ELL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ELL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELL BINDING SITE, designated SEQ ID:11377, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19628] Another function of GAM117 is therefore inhibition of ELL (Accession NM_006532.1) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL.

[19629] ENDO180 (Accession) is another GAM117 target gene, herein designated TARGET GENE. ENDO180 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by ENDO180, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENDO180 BINDING SITE, designated SEQ ID:5722, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19630] Another function of GAM117 is therefore inhibition of ENDO180 (Accession) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDO180.

[19631] FLJ14810 (Accession NM_032843.1) is another GAM117 target gene, herein designated TARGET GENE. FLJ14810 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14810, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:9480, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19632] Another function of GAM117 is therefore inhibition of

FLJ14810 (Accession NM_032843.1) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14810.

[19633] KIAA0237 (Accession NM_014747.1) is another GAM117 target gene, herein designated TARGET GENE. KIAA0237 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:10563, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:267.

[19634] Another function of GAM117 is therefore inhibition of KIAA0237 (Accession NM_014747.1) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237.

[19635] KIAA0495 (Accession XM_031397.7) is another GAM117 target gene, herein designated TARGET GENE. KIAA0495 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0495, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:1285, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19636] Another function of GAM117 is therefore inhibition of KIAA0495 (Accession XM_031397.7) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495.

[19637] KIAA1332 (Accession XM_048774.4) is another GAM117 target gene, herein designated TARGET GENE. KIAA1332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:5038, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:267.

[19638] Another function of GAM117 is therefore inhibition of KIAA1332 (Accession XM_048774.4) . Accordingly, utili-

ties of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332.

[19639] LOC124930 (Accession) is another GAM117 target gene, herein designated TARGET GENE. LOC124930 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC124930, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124930 BINDING SITE, designated SEQ ID:2231, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19640] Another function of GAM117 is therefore inhibition of LOC124930 (Accession) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124930.

[19641] LOC143915 (Accession) is another GAM117 target gene, herein designated TARGET GENE. LOC143915 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC143915, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143915 BINDING SITE, designated SEQ ID:11372, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19642] Another function of GAM117 is therefore inhibition of LOC143915 (Accession) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143915.

[19643] LOC149830 (Accession NM_177549.1) is another GAM117 target gene, herein designated TARGET GENE. LOC149830 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149830, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149830 BINDING SITE, designated SEQ ID:17004, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19644] Another function of GAM117 is therefore inhibition of LOC149830 (Accession NM_177549.1) . Accordingly, utilities of GAM117 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149830.

[19645] LOC152627 (Accession XM_087495.1) is another GAM117 target gene, herein designated TARGET GENE. LOC152627 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152627, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:2005, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:267.

[19646] Another function of GAM117 is therefore inhibition of LOC152627 (Accession XM_087495.1) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152627.

[19647] LOC255696 (Accession) is another GAM117 target gene, herein designated TARGET GENE. LOC255696 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255696, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC255696 BINDING SITE, designated SEQ ID:12910, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:267.

[19648] Another function of GAM117 is therefore inhibition of LOC255696 (Accession) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255696.

[19649] LOC91632 (Accession XM_039721.2) is another GAM117 target gene, herein designated TARGET GENE. LOC91632 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91632, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91632 BINDING SITE, designated SEQ ID:5850, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19650] Another function of GAM117 is therefore inhibition of LOC91632 (Accession XM_039721.2) . Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91632.

[19651] Microtubule-associated protein, rp/eb family, member 3 (MAPRE3, Accession NM_012326.2) is another GAM117 target gene, herein designated TARGET GENE. MAPRE3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAPRE3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:8716, to the nucleotide sequence of GAM117 RNA, herein designated GAM RNA, also designated SEQ ID:216.

[19652] Another function of GAM117 is therefore inhibition of Microtubule-associated protein, rp/eb family, member 3 (MAPRE3, Accession NM_012326.2), a gene which interact with cytoplasmic microtubules,and with the adenomatous polyposis coli. Accordingly, utilities of GAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3.

[19653] The function of MAPRE3 has been established by previous studies. EB1 family proteins (e.g., MAPRE1; 603108) interact with cytoplasmic microtubules in interphase cells, with mitotic spindles, and with the adenomatous polyposis coli

(APC; 175100) tumor suppressor gene. Using a yeast 2-hybrid screen with the C terminus of APC- like (APCL) as bait, Nakagawa et al. (2000) isolated a cDNA encoding MAPRE3, which they termed EB3. The predicted 282-amino acid protein is 54% identical to MAPRE1. Northern blot analysis revealed expression of a 2.2- kb transcript predominantly in brain and muscle. GST pull- down analysis determined that a homologous region in the C termini of APC and APCL binds to MAPRE3. Immunofluorescence and confocal microscopy demonstrated that MAPRE3 is localized in the microtubule network and colocalizes with APCL in the perinucleus and microtubule network. By EST database searching, RT- PCR, and screening a fetal brain cDNA library, Su and Qi (2001) isolated a cDNA encoding a protein identical to the EB3 protein reported by Nakagawa et al. (2000), which they termed EBF3, and an alternative transcript encoding a 266- amino acid protein. RT-PCR and Western blot analyses indicated that both transcripts are ubiquitously expressed. Genomic sequence analysis showed that there are most likely 3 MAPRE genes: MAPRE1 encodes EB1; MAPRE2 (OMIM Ref. No. 605789) encodes RP1 and the EB2 fragment; and MAPRE3 encodes EBF3 and the fragment RP3. MAPRE3, like MAPRE1 and

MAPRE2, contains 7 exons, but the coding region of MAPRE3 spans only 4.2 kb due to relatively short introns. Western blot analysis detected expression of both isoforms as approximately 32- kD proteins in most cell lines tested. Binding analysis determined that both isoforms interact with APC. By FISH, Nakagawa et al. (2000) mapped the MAPRE3 gene to 2p23.3- p23.1. Using radiation hybrid analysis, Su and Qi (2001) mapped the MAPRE3 gene to 2p23.3- p23.2, where it is closely linked and proximal to the ketohexokinase gene (OMIM Ref. No. 229800).

[19654]

[19655] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19656] Nakagawa, H.; Koyama, K.; Murata, Y.; Morito, M.; Akiyama, T.; Nakamura, Y. : EB3, a novel member of the EB1 family preferentially expressed in the central nervous system, binds to a CNS- specific APC homologue. Oncogene 19: 210- 216, 2000. ; and

[19657] Su, L.- K.; Qi, Y. : Characterization of human MAPRE genes and their proteins. Genomics 71: 143- 149, 2001.

[19658] Further studies establishing the function and utilities of MAPRE3 are found in John Hopkins OMIM database record

ID 605788, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[19659] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 118 (GAM118), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19660] GAM118 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM118 was detected is described hereinabove with reference to Figs. 8-15.

[19661] GAM118 gene, herein designated GAM GENE, and GAM118 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19662] GAM118 gene encodes a GAM118 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM118 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM118 precursor RNA is designated SEQ ID:160, and is provided hereinbelow with reference to the sequence listing part.

[19663] GAM118 precursor RNA folds onto itself, forming GAM118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19664] GAM118 precursor RNA folds onto itself, forming GAM118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19665] Nucleotide sequence of GAM118 precursor RNA, designated SEQ-ID: 160, and a schematic representation of a predicted secondary folding of GAM118 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19666] An enzyme complex designated DICER COMPLEX, `dices` the GAM118 folded precursor RNA into GAM118 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM118 RNA is designated SEQ ID:363, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19667] GAM118 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM118 target RNA, herein designated GAM TARGET RNA. GAM118 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19668] GAM118 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM118 target RNA, herein designated GAM TARGET RNA. This complementary binding is

due to the fact that the nucleotide sequence of GAM118 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM118 RNA may have a different number of target binding sites in untranslated regions of a GAM118 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19669] The complementary binding of GAM118 RNA, herein designated GAM RNA, to target binding sites on GAM118 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM118 target RNA into GAM118 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19670] It is appreciated that GAM118 target gene, herein desig-

nated TARGET GENE, in fact represents a plurality of GAM118 target genes. The mRNA of each one of this plurality of GAM118 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM118 RNA, herein designated GAM RNA, and which when bound by GAM118 RNA causes inhibition of translation of respective one or more GAM118 target proteins.

[19671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM118 gene, herein designated GAM GENE, on one or more GAM118 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a

tiny RNA world, Science 294,779 (2001)).

[19672] It is appreciated that specific functions and accordingly utilities of GAM118 correlate with, and may be deduced from, the identity of the target genes which GAM118 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19673]

[19674]

[19675] JM5 (Accession NM_007075.1) is a GAM118 target gene, herein designated TARGET GENE. JM5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JM5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JM5 BINDING SITE, designated SEQ ID:1897, to the nucleotide sequence of GAM118 RNA, herein designated GAM RNA, also designated SEQ ID:363.

[19676] A function of GAM118 is therefore inhibition of JM5 (Accession NM_007075.1) . Accordingly, utilities of GAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM5.

[19677]

[19678] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 119 (GAM119), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19679] GAM119 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM119 was detected is described hereinabove with reference to Figs. 8-15.

[19680] GAM119 gene, herein designated GAM GENE, and GAM119 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19681] GAM119 gene encodes a GAM119 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM119 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM119 precursor RNA is designated SEQ ID:4, and is provided hereinbelow with reference to the sequence listing part.

[19682] GAM119 precursor RNA folds onto itself, forming GAM119 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19683] GAM119 precursor RNA folds onto itself, forming GAM119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19684] Nucleotide sequence of GAM119 precursor RNA, designated SEQ-ID: 4, and a schematic representation of a predicted secondary folding of GAM119 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19685] An enzyme complex designated DICER COMPLEX, `dices` the GAM119 folded precursor RNA into GAM119 RNA,

herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM119 RNA is designated SEQ ID:391, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19686] GAM119 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM119 target RNA, herein designated GAM TARGET RNA. GAM119 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19687] GAM119 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM119 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM119 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM119 RNA may have a different number of target binding sites in untranslated regions of a GAM119 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19688] The complementary binding of GAM119 RNA, herein designated GAM RNA, to target binding sites on GAM119 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM119 target RNA into GAM119 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19689] It is appreciated that GAM119 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM119 target genes. The mRNA of each one of this plu-

rality of GAM119 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM119 RNA, herein designated GAM RNA, and which when bound by GAM119 RNA causes inhibition of translation of respective one or more GAM119 target proteins.

[19690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM119 gene, herein designated GAM GENE, on one or more GAM119 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19691] It is appreciated that specific functions and accordingly

utilities of GAM119 correlate with, and may be deduced from, the identity of the target genes which GAM119 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19692]

[19693]

[19694] Keratin associated protein 4-4 (KRTAP4-4, Accession NM_032524.1) is a GAM119 target gene, herein designated TARGET GENE. KRTAP4-4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRTAP4-4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRTAP4-4 BINDING SITE, designated SEQ ID:9962, to the nucleotide sequence of GAM119 RNA, herein designated GAM RNA, also designated SEQ ID:391.

[19695] A function of GAM119 is therefore inhibition of Keratin associated protein 4-4 (KRTAP4-4, Accession NM_032524.1) . Accordingly, utilities of GAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP4-4.

[19696] LOC257444 (Accession XM_088028.2) is another GAM119 target gene, herein designated TARGET GENE. LOC257444 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257444, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257444 BINDING SITE, designated SEQ ID:6487, to the nucleotide sequence of GAM119 RNA, herein designated GAM RNA, also designated SEQ ID:391.

[19697] Another function of GAM119 is therefore inhibition of LOC257444 (Accession XM_088028.2) . Accordingly, utilities of GAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257444.

[19698]

[19699] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 120 (GAM120), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19700] GAM120 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM120 was detected is described hereinabove with reference to Figs. 8-15.

[19701] GAM120 gene, herein designated GAM GENE, and GAM120 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19702] GAM120 gene encodes a GAM120 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM120 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM120 precursor RNA is designated SEQ ID:191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:191 is located at position 130315489 relative to chromosome 3.

[19703] GAM120 precursor RNA folds onto itself, forming GAM120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[19704] GAM120 precursor RNA folds onto itself, forming GAM120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19705] Nucleotide sequence of GAM120 precursor RNA, designated SEQ-ID: 191, and a schematic representation of a predicted secondary folding of GAM120 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19706] An enzyme complex designated DICER COMPLEX, `dices` the GAM120 folded precursor RNA into GAM120 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy

Group: C) nucleotide sequence of GAM120 RNA is designated SEQ ID:285, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19707] GAM120 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM120 target RNA, herein designated GAM TARGET RNA. GAM120 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19708] GAM120 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM120 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM120 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limit-

ing GAM120 RNA may have a different number of target binding sites in untranslated regions of a GAM120 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19709] The complementary binding of GAM120 RNA, herein designated GAM RNA, to target binding sites on GAM120 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM120 target RNA into GAM120 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19710] It is appreciated that GAM120 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM120 target genes. The mRNA of each one of this plurality of GAM120 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM120 RNA, herein designated GAM RNA, and which when bound by GAM120 RNA causes inhibition of translation of respective one or more GAM120 target proteins.

[19711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM120 gene, herein designated GAM GENE, on one or more GAM120 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19712] It is appreciated that specific functions and accordingly utilities of GAM120 correlate with, and may be deduced from, the identity of the target genes which GAM120 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19713]

[19714]

[19715] FLJ10521 (Accession NM_018125.1) is a GAM120 target gene, herein designated TARGET GENE. FLJ10521 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10521, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10521 BINDING SITE, designated SEQ ID:4274, to the nucleotide sequence of GAM120 RNA, herein designated GAM RNA, also designated SEQ ID:285.

[19716] A function of GAM120 is therefore inhibition of FLJ10521 (Accession NM_018125.1) . Accordingly, utilities of GAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10521.

[19717] Folylpolyglutamate synthase (FPGS, Accession NM_004957.2) is another GAM120 target gene, herein designated TARGET GENE. FPGS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FPGS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FPGS BINDING SITE, designated SEQ ID:7363, to the nucleotide sequence of GAM120 RNA,

herein designated GAM RNA, also designated SEQ ID:285.

[19718] Another function of GAM120 is therefore inhibition of Folylpolyglutamate synthase (FPGS, Accession NM_004957.2), a gene which is involved in conversion of folates to polyglutamate derivatives. Accordingly, utilities of GAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPGS.

[19719] The function of FPGS has been established by previous studies. By functional complementation of an Escherichia coli folC mutant, Garrow et al. (1992) cloned a human cDNA for folylpoly(gamma- glutamate) synthetase (FPGS; tetrahydrofolate:L- glutamate gamma- ligase (ADP forming); EC 6.3.2.17). The cDNA encodes a 545- residue protein of Mr 60,128. Expression of the cDNA in E. coli resulted in elevated expression of an enzyme with characteristics of mammalian FPGS. Furthermore, expression of the cDNA in AUXB1, a mammalian cell lacking FPGS activity, overcame the cell's requirement for thymidine and purines but did not overcome the cell's glycine auxotrophy, consistent with expression of the protein in the cytosol but not in the mitochondria. Freemantle et al. (1995) proposed that the mitochondrial and cytosolic forms of FPGS are, in fact, derived from the same gene, arising

from the use of the 2 different translation initiation codons, and that the translation products differ by the presence of a 42- residue amino- terminal mitochondrial leader peptide. Taylor et al. (1995) likewise concluded that a single locus encodes FPGS- related sequences in the human genome. The complete 2256 nucleotides of cDNA for the 5- prime untranslated region, mitochondrial leader sequence, coding region, and 3- prime untranslated region were found to be distributed on 15 exons stretching over 11.2 kb of genomic DNA.

[19720]

[19724] Further studies establishing the function and utilities of

FPGS are found in John Hopkins OMIM database record ID 136510, and in cited publications listed in Table 5, which are hereby incorporated by reference.HCC-4 (Accession NM_138611.1) is another GAM120 target gene, herein designated TARGET GENE. HCC-4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HCC-4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HCC-4 BINDING SITE, designated SEQ ID:1747, to the nucleotide sequence of GAM120 RNA, herein designated GAM RNA, also designated SEQ ID:285.

[19725] Another function of GAM120 is therefore inhibition of HCC-4 (Accession NM_138611.1) . Accordingly, utilities of GAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCC-4.

[19726] LOC253070 (Accession) is another GAM120 target gene, herein designated TARGET GENE. LOC253070 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC253070, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC253070 BINDING SITE, designated SEQ ID:19769, to the nucleotide sequence of GAM120 RNA, herein designated GAM RNA, also designated SEQ ID:285.

[19727] Another function of GAM120 is therefore inhibition of LOC253070 (Accession) . Accordingly, utilities of GAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253070.

[19728] Neurotrophic tyrosine kinase, receptor, type 2 (NTRK2, Accession NM_006180.2) is another GAM120 target gene, herein designated TARGET GENE. NTRK2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NTRK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:17811, to the nucleotide sequence of GAM120 RNA, herein designated GAM RNA, also designated SEQ ID:285.

[19729] Another function of GAM120 is therefore inhibition of Neurotrophic tyrosine kinase, receptor, type 2 (NTRK2, Accession NM_006180.2), a gene which is involved in the development and/or maintenance of the nervous system.

Accordingly, utilities of GAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2.

[19730] The function of NTRK2 has been established by previous studies. Nakagawara et al. (1995) isolated cDNAs spanning the entire coding region of both human full- length and truncated forms of TRKB from human brain cDNA libraries. The full- length TRKB coded for a protein of 822 amino acid residues. The putative mature peptide sequence was 49% and 55% homologous to human NTRK1 and NTRK3, respectively. Nine of 13 cysteine residues, 4 of 12 N- glycosylation sites in the extracellular domain, and 10 of 13 tyrosine residues in the intracellular domain are conserved among NTRK1, NTRK2, and NTRK3. Two major sizes of NTRK2 transcripts were expressed in human brain.

[19731] Animal model experiments lend further support to the function of NTRK2. To study the function of TRKB in the cerebellum, Rico et al. (2002) deleted the Trkb gene in mouse cerebellar precursors by Wnt1- driven Cre- mediated recombination. Despite the absence of Trkb, the mature cerebellum of mutant mice appeared similar to that of wildtype, with all types of cells present in normal num-

bers and positions. Granule and Purkinje cell dendrites appeared normal, and the former had typical numbers of excitatory synapses. By contrast, inhibitory interneurons were strongly affected. Although present in normal number, inhibitory interneurons exhibited reduced amounts of GABAergic markers and developed reduced numbers of GABAergic boutons and synaptic specializations. Thus, Rico et al. (2002) concluded that TRKB is essential to the development of GABAergic neurons and regulates synapse formation in addition to its role in the development of axon terminals.

[19732] It is appreciated that the abovementioned animal model for NTRK2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[19733] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19734] Nakagawara, A.; Liu, X.- G.; Ikegaki, N.; White, P. S.; Yamashiro, D. J.; Nycum, L. M.; Biegel, J. A.; Brodeur, G. M. : Cloning and chromosomal localization of the human TRK-B tyrosine kinase receptor gene (NTRK2). Genomics 25: 538- 546, 1995. ; and

[19735] Rico, B.; Xu, B.; Reichardt, L. F. : TrkB receptor signaling is required for establishment of GABAergic synapses in the cerebellum. Nature Neurosci. 5: 225- 233, 2002.

[19736] Further studies establishing the function and utilities of NTRK2 are found in John Hopkins OMIM database record ID 600456, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[19737] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 121 (GAM121), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19738] GAM121 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM121 was detected is described hereinabove with reference to Figs. 8-15.

[19739] GAM121 gene, herein designated GAM GENE, and GAM121 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19740] GAM121 gene encodes a GAM121 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM121 precur-

sor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM121 precursor RNA is designated SEQ ID:69, and is provided hereinbelow with reference to the sequence listing part.

[19741] GAM121 precursor RNA folds onto itself, forming GAM121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19742] GAM121 precursor RNA folds onto itself, forming GAM121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19743] Nucleotide sequence of GAM121 precursor RNA, designated SEQ-ID: 69, and a schematic representation of a predicted secondary folding of GAM121 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19744] An enzyme complex designated DICER COMPLEX, `dices` the GAM121 folded precursor RNA into GAM121 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM121 RNA is designated SEQ ID:309, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19745] GAM121 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM121 target RNA, herein designated GAM TARGET RNA. GAM121 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[19746] GAM121 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM121 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM121 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM121 RNA may have a different number of target binding sites in untranslated regions of a GAM121 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19747] The complementary binding of GAM121 RNA, herein designated GAM RNA, to target binding sites on GAM121 target RNA, herein designated GAM TARGET RNA, such as

BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM121 target RNA into GAM121 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19748] It is appreciated that GAM121 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM121 target genes. The mRNA of each one of this plurality of GAM121 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM121 RNA, herein designated GAM RNA, and which when bound by GAM121 RNA causes inhibition of translation of respective one or more GAM121 target proteins.

[19749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM121 gene, herein designated GAM GENE, on one or more GAM121 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19750] It is appreciated that specific functions and accordingly utilities of GAM121 correlate with, and may be deduced from, the identity of the target genes which GAM121 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19751]

[19752]

[19753] A disintegrin and metalloproteinase domain 11 (ADAM11, Accession NM_002390.2) is a GAM121 target gene, herein designated TARGET GENE. ADAM11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM11 BINDING SITE, designated SEQ ID:8088, to the

nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19754] A function of GAM121 is therefore inhibition of A disintegrin and metalloproteinase domain 11 (ADAM11, Accession NM_002390.2), a gene which Member of the ADAM family of zinc metalloproteases. and therefore may be associated with Breast and ovarian cancers. Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of Breast and ovarian cancers, and of other diseases and clinical conditions associated with ADAM11.

[19755] The function of ADAM11 has been established by previous studies. From chromosomal region 17q21.3, where a tumor suppressor gene for breast and ovarian cancers is thought to reside, Emi et al. (1993) isolated a novel gene from a cosmid clone that showed somatic rearrangements in 2 breast cancers. The gene encoded a 524- amino acid metalloproteinase- like, disintegrin- like, and cysteine-rich (MDC) protein with sequence similarity to members of the snake- venom metalloprotease/disintegrin family and guinea- pig sperm- surface protein PH- 30 (OMIM Ref. No. 601533). These proteins have been implicated in cell-cell or cell- extracellular matrix interactions. Rearrangements in both tumors involved multiple exons and dis-

rupted the coding region of the gene. Sagane et al. (1998) noted that MDC is a member of the cellular disintegrin, or ADAM (a disintegrin and metalloproteinase), family. See ADAM20 (OMIM Ref. No. 603712). They isolated cDNAs encoding 2 related human proteins, MDC2 (OMIM Ref. No. 603709) and MDC3 (OMIM Ref. No. 603710). Northern blot analysis revealed that, like the MDC2 and MDC3 mRNAs, the 5- kb MDC transcript was expressed predominantly in brain.

[19756]

[19757] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19758] Emi, M.; Katagiri, T.; Harada, Y.; Saito, H.; Inazawa, J.; Ito, I.; Kasumi, F.; Nakamura, Y. : A novel metalloprotease/disintegrin- like gene at 17q21.3 is somatically rearranged in two primary breast cancers. Nature Genet. 5: 151- 157, 1993. ; and

[19759] Sagane, K.; Ohya, Y.; Hasegawa, Y.; Tanaka, I. : Metalloproteinase- like, disintegrin- like, cysteine- rich proteins MDC2 and MDC3: novel human cellular disintegrins highly expressed in the.

[19760] Further studies establishing the function and utilities of

ADAM11 are found in John Hopkins OMIM database record ID 155120, and in cited publications listed in Table 5, which are hereby incorporated by reference.Annexin a6 (ANXA6, Accession NM_004033.1) is another GAM121 target gene, herein designated TARGET GENE. ANXA6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANXA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANXA6 BINDING SITE, designated SEQ ID:12042, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19761] Another function of GAM121 is therefore inhibition of Annexin a6 (ANXA6, Accession NM_004033.1), a gene which may associate with cd21, and may regulate the release of ca(2+) from intracellular stores. Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANXA6.

[19762] The function of ANXA6 has been established by previous studies. The protein p68 is a member of a family of proteins that bind membrane or cytoskeleton in a Ca(2+)-

dependent manner. They are characterized by homologous amino acid sequences that are present in multiple copies in each protein. The family is variously known as calelectrins, annexins, calpactins, endonexins, and lipocortins. p68 is an intracellular monomeric protein of approximately 68,000 MW. Davies et al. (1989) assigned the ANXA6 gene to 5q32- q34 by use of a cDNA clone to probe genomic DNA from rodent- human somatic cell hybrids and for in situ hybridization. The corresponding gene in the mouse was assigned to chromosome 11 by probing DNA from rodent- rodent somatic cell hybrids. Warrington and Bengtsson (1994) used 3 physical mapping methods (radiation hybrid mapping, pulsed field gel electrophoresis, and fluorescence in situ hybridization of interphase nuclei) to determine the order and relative distances between 12 loci in the 5q31- q33 region. ANXA6 was one of those loci. Smith et al. (1994) demonstrated that the ANX6 gene is approximately 60 kb long and contains 26 exons. The genomic sequence at the 3- prime end does not contain a canonical polyadenylylation signal. The genomic sequence upstream of the transcription start site contains TATAA and CAAT motifs. The spatial organization of the exons revealed no obvious similarities be-

tween the 2 halves of the ANX6 gene. Comparison of the intron/exon boundary positions of ANX6 with those of ANX1 (OMIM Ref. No. 151690) and ANX2 (OMIM Ref. No. 151740) revealed that within the repeated domains the breakpoints are perfectly conserved except for exon 8, which is 1 codon smaller in ANX2. The corresponding point in the second half of ANX6 is represented by 2 exons, exons 20 and 21. The latter exon is alternatively spliced, giving rise to annexin VI isoforms that differ with respect to a 6- amino acid insertion at the start of repeat 7.

[19763]

[19764] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19765] Davies, A. A.; Moss, S. E.; Crompton, M. R.; Jones, T. A.; Spurr, N. K.; Sheer, D.; Kozak, C.; Crumpton, M. J. : The gene coding for the p68 calcium- binding protein is localized to bands q32- q34 of human chromosome 5, and to mouse chromosome 11. Hum. Genet. 82: 234- 238, 1989. ; and

[19766] Smith, P. D.; Davies, A.; Crumpton, M. J.; Moss, S. E. : Structure of the human annexin VI gene. Proc. Nat. Acad.

Sci. 91: 2713- 2717, 1994.

[19767] Further studies establishing the function and utilities of ANXA6 are found in John Hopkins OMIM database record ID 114070, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cystatin e/m (CST6, Accession NM_001323.2) is another GAM121 target gene, herein designated TARGET GENE. CST6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CST6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CST6 BINDING SITE, designated SEQ ID:10154, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19768] Another function of GAM121 is therefore inhibition of Cystatin e/m (CST6, Accession NM_001323.2), a gene which is a cysteine (thiol) protease inhibitor that inhibits papain. and therefore may be associated with Metastatic tumors. Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of Metastatic tumors, and of other diseases and clinical conditions associated with CST6.

[19769] The function of CST6 has been established by previous studies. Cystatins are endogenous inhibitors of mammalian lysosomal cysteine proteinases, such as cathepsins B (OMIM Ref. No. 116810), L (OMIM Ref. No. 116880), H (OMIM Ref. No. 116820), and S (OMIM Ref. No. 116845), and the plant cysteine proteinases papain, acinidin, and ficin. They function both intracellularly and extracellularly. All inhibitory cystatins display structural and functional similarities, and are members of a single protein superfamily comprising 3 distinct families of closely related proteins: stefins (see OMIM Ref. No. 184600), cystatins (see OMIM Ref. No. 123855), and kininogens (OMIM Ref. No. 228960). Using differential display, Sotiropoulou et al. (1997) identified a novel human cystatin, cystatin M, as being downregulated in metastatic breast tumor cells as compared to primary tumor cells. Stenman et al. (1997) mapped the gene encoding cystatin M (CST6) to 11q13 by fluorescence in situ hybridization. CST6 is a member of the type 2 cystatin gene family. All 7 previously cloned members of this family had been found to be clustered in a narrow region on 20p11.2.

[19770]

[19771] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[19772] Sotiropoulou, G.; Anisowicz, A.; Sager, R. : Identification, cloning, and characterization of cystatin M, a novel cysteine proteinase inhibitor, down- regulated in breast cancer. J. Biol. Chem. 272: 903- 910, 1997. ; and

[19773] Stenman, G.; Astrom, A.- K.; Roijer, E.; Sotiropoulou, G.; Zhang, M.; Sager, R. : Assignment of a novel cysteine proteinase inhibitor (CST6) to 11q13 by fluorescence in situ hybridization.

[19774] Further studies establishing the function and utilities of CST6 are found in John Hopkins OMIM database record ID 601891, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ13263 (Accession NM_025125.1) is another GAM121 target gene, herein designated TARGET GENE. FLJ13263 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13263, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13263 BINDING SITE, designated SEQ ID:18107, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA,

also designated SEQ ID:309.

[19775] Another function of GAM121 is therefore inhibition of FLJ13263 (Accession NM_025125.1) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13263.

[19776] Homeo box (h6 family) 1 (HMX1, Accession) is another GAM121 target gene, herein designated TARGET GENE. HMX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HMX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMX1 BINDING SITE, designated SEQ ID:18643, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19777] Another function of GAM121 is therefore inhibition of Homeo box (h6 family) 1 (HMX1, Accession), a gene which binds to the DNA. Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMX1.

[19778] The function of HMX1 has been established by previous studies. Proteins encoded by homeo box genes function

as transcription factors capable of binding DNA. Structural analysis of homeodomains indicate that these proteins form a helix- turn- helix motif, with the third helix serving as a DNA binding recognition helix. The recognition helix has a highly conserved 8- amino acid region specific to many homeo box genes. This suggested that DNA probes based on the conserved region of the third helix would serve as powerful tools to screen for homeo box genes. Stadler et al. (1992) used this strategy to identify homeo box genes that are expressed in the developing human craniofacial region. Probing a cDNA library constructed from human embryonic craniofacial tissue, they identified a homeo box gene that mapped to 4p16.1. Designated H6, the 'new' gene shared only 57 to 65% amino acid identity to previously reported homeodomains. The mapping was performed by study of somatic cell hybrids containing specific deletions of human chromosome 4 using PCR methods, after initial assignment by hybridization of radiolabeled H6 DNA to Southern blots containing DNA derived from a mouse/human somatic cell hybrid containing only human chromosome 4. The initial assignment to 4p16.1 was confirmed by studies of linkage between a collection of markers on chromosome 4 and a

250- bp amplification product from H6 that demonstrated a single- strand conformation polymorphism (SSCP) when electrophoresed on a nondenaturing acrylamide gel. Although HOX7 (OMIM Ref. No. 142983) also maps to 4p16.1, it is unlikely that HOX7 and H6 are members of a homeo box cluster because the linkage data placed H6 more than 10 cM proximal to HOX7 and there was no significant amino acid identity of H6 and HOX7 outside the homeodomain. Wang et al. (1997) mapped the murine Hmx1 homeo box gene to the proximal region of mouse chromosome 5 by backcross matings.

[19779]

[19780] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19781] Stadler, H. S.; Padanilam, B. J.; Buetow, K.; Murray, J. C.; Solursh, M. : Identification and genetic mapping of a homeobox gene to the 4p16.1 region of human chromosome 4. Proc. Nat. Acad. Sci. 89: 11579- 11583, 1992. ; and

[19782] Wang, W.; Yoshiura, K.; Murray, J.; Lufkin, T. : Assignment of the murine Hmx1 homeobox gene to the proximal region of mouse chromosome 5. Mammalian Genome 8:

869- 876, 1997.

[19783] Further studies establishing the function and utilities of HMX1 are found in John Hopkins OMIM database record ID 142992, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0014 (Accession NM_014665.1) is another GAM121 target gene, herein designated TARGET GENE. KIAA0014 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0014, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:17252, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19784] Another function of GAM121 is therefore inhibition of KIAA0014 (Accession NM_014665.1) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014.

[19785] KIAA0140 (Accession NM_014661.1) is another GAM121 target gene, herein designated TARGET GENE. KIAA0140 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA0140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0140 BINDING SITE, designated SEQ ID:3528, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19786] Another function of GAM121 is therefore inhibition of KIAA0140 (Accession NM_014661.1) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0140.

[19787] LOC221424 (Accession XM_168060.2) is another GAM121 target gene, herein designated TARGET GENE. LOC221424 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221424, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221424 BINDING SITE, designated SEQ ID:7844, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19788] Another function of GAM121 is therefore inhibition of

LOC221424 (Accession XM_168060.2) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221424.

[19789] LOC256158 (Accession) is another GAM121 target gene, herein designated TARGET GENE. LOC256158 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:3086, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19790] Another function of GAM121 is therefore inhibition of LOC256158 (Accession) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158.

[19791] LOC90120 (Accession XM_291299.1) is another GAM121 target gene, herein designated TARGET GENE. LOC90120 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90120, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90120 BINDING SITE, designated SEQ ID:7775, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19792] Another function of GAM121 is therefore inhibition of LOC90120 (Accession XM_291299.1) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90120.

[19793] NKX2C (Accession) is another GAM121 target gene, herein designated TARGET GENE. NKX2C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NKX2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NKX2C BINDING SITE, designated SEQ ID:6138, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19794] Another function of GAM121 is therefore inhibition of NKX2C (Accession) . Accordingly, utilities of GAM121 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX2C.

[19795] Syndecan 3 (n-syndecan) (SDC3, Accession NM_014654.1) is another GAM121 target gene, herein designated TARGET GENE. SDC3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:12205, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19796] Another function of GAM121 is therefore inhibition of Syndecan 3 (n-syndecan) (SDC3, Accession NM_014654.1). Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3.

[19797] SDR1 (Accession NM_004753.1) is another GAM121 target gene, herein designated TARGET GENE. SDR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of SDR1 BINDING SITE, designated SEQ ID:11207, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19798] Another function of GAM121 is therefore inhibition of SDR1 (Accession NM_004753.1) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDR1.

[19799] Serine/threonine kinase 22d (spermiogenesis associated) (STK22D, Accession NM_032028.2) is another GAM121 target gene, herein designated TARGET GENE. STK22D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STK22D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STK22D BINDING SITE, designated SEQ ID:2793, to the nucleotide sequence of GAM121 RNA, herein designated GAM RNA, also designated SEQ ID:309.

[19800] Another function of GAM121 is therefore inhibition of Serine/threonine kinase 22d (spermiogenesis associated) (STK22D, Accession NM_032028.2) . Accordingly, utilities of GAM121 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with STK22D.

[19801]

[19802] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 122 (GAM122), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19803] GAM122 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM122 was detected is described hereinabove with reference to Figs. 8-15.

[19804] GAM122 gene, herein designated GAM GENE, and GAM122 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19805] GAM122 gene encodes a GAM122 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM122 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM122 precursor RNA is designated SEQ ID:34, and is provided hereinbelow with reference to the sequence list-

ing part. Nucleotide sequence SEQ ID:34 is located at position 242201799 relative to chromosome 2.

[19806] GAM122 precursor RNA folds onto itself, forming GAM122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19807] GAM122 precursor RNA folds onto itself, forming GAM122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19808] Nucleotide sequence of GAM122 precursor RNA, designated SEQ-ID: 34, and a schematic representation of a predicted secondary folding of GAM122 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[19809] An enzyme complex designated DICER COMPLEX, `dices` the GAM122 folded precursor RNA into GAM122 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM122 RNA is designated SEQ ID:337, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19810] GAM122 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM122 target RNA, herein designated GAM TARGET RNA. GAM122 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19811] GAM122 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM122 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM122 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM122 RNA may have a different number of target binding sites in untranslated regions of a GAM122 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19812] The complementary binding of GAM122 RNA, herein designated GAM RNA, to target binding sites on GAM122 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM122 target RNA into GAM122 target protein, herein designated GAM TARGET PROTEIN.

GAM target protein is therefore outlined by a broken line.

[19813] It is appreciated that GAM122 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM122 target genes. The mRNA of each one of this plurality of GAM122 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM122 RNA, herein designated GAM RNA, and which when bound by GAM122 RNA causes inhibition of translation of respective one or more GAM122 target proteins.

[19814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM122 gene, herein designated GAM GENE, on one or more GAM122 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19815] It is appreciated that specific functions and accordingly utilities of GAM122 correlate with, and may be deduced from, the identity of the target genes which GAM122 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19816]

[19817]

[19818] LOC254936 (Accession) is a GAM122 target gene, herein designated TARGET GENE. LOC254936 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254936, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254936 BINDING SITE, designated SEQ ID:4945, to the nucleotide sequence of GAM122 RNA, herein designated GAM RNA, also designated SEQ ID:337.

[19819] A function of GAM122 is therefore inhibition of LOC254936 (Accession) . Accordingly, utilities of

GAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254936.

[19820]

[19821] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 123 (GAM123), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19822] GAM123 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM123 was detected is described hereinabove with reference to Figs. 8-15.

[19823] GAM123 gene, herein designated GAM GENE, and GAM123 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19824] GAM123 gene encodes a GAM123 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM123 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM123 precursor RNA is designated SEQ ID:166, and is

provided hereinbelow with reference to the sequence listing part.

[19825] GAM123 precursor RNA folds onto itself, forming GAM123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19826] GAM123 precursor RNA folds onto itself, forming GAM123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19827] Nucleotide sequence of GAM123 precursor RNA, designated SEQ-ID: 166, and a schematic representation of a predicted secondary folding of GAM123 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[19828] An enzyme complex designated DICER COMPLEX, `dices` the GAM123 folded precursor RNA into GAM123 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM123 RNA is designated SEQ ID:212, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19829] GAM123 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM123 target RNA, herein designated GAM TARGET RNA. GAM123 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19830] GAM123 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM123 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM123 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM123 RNA may have a different number of target binding sites in untranslated regions of a GAM123 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19831] The complementary binding of GAM123 RNA, herein designated GAM RNA, to target binding sites on GAM123 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM123 target RNA into GAM123 target protein, herein designated GAM TARGET PROTEIN.

GAM target protein is therefore outlined by a broken line.

[19832] It is appreciated that GAM123 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM123 target genes. The mRNA of each one of this plurality of GAM123 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM123 RNA, herein designated GAM RNA, and which when bound by GAM123 RNA causes inhibition of translation of respective one or more GAM123 target proteins.

[19833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM123 gene, herein designated GAM GENE, on one or more GAM123 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19834] It is appreciated that specific functions and accordingly utilities of GAM123 correlate with, and may be deduced from, the identity of the target genes which GAM123 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19835]

[19836]

[19837] Glycine cleavage system protein h (aminomethyl carrier) (GCSH, Accession NM_004483.1) is a GAM123 target gene, herein designated TARGET GENE. GCSH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GCSH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCSH BINDING SITE, designated SEQ ID:9934, to the nucleotide sequence of GAM123 RNA, herein designated GAM RNA, also designated SEQ ID:212.

[19838] A function of GAM123 is therefore inhibition of Glycine

cleavage system protein h (aminomethyl carrier) (GCSH, Accession NM_004483.1) . Accordingly, utilities of GAM123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCSH.

[19839]

[19840] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 124 (GAM124), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19841] GAM124 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM124 was detected is described hereinabove with reference to Figs. 8-15.

[19842] GAM124 gene, herein designated GAM GENE, and GAM124 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19843] GAM124 gene encodes a GAM124 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM124 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM124 precursor RNA is designated SEQ ID:108, and is provided hereinbelow with reference to the sequence listing part.

[19844] GAM124 precursor RNA folds onto itself, forming GAM124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19845] GAM124 precursor RNA folds onto itself, forming GAM124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19846] Nucleotide sequence of GAM124 precursor RNA, designated SEQ-ID: 108, and a schematic representation of a

predicted secondary folding of GAM124 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19847] An enzyme complex designated DICER COMPLEX, `dices` the GAM124 folded precursor RNA into GAM124 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM124 RNA is designated SEQ ID:323, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19848] GAM124 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM124 target RNA, herein designated GAM TARGET RNA. GAM124 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19849] GAM124 RNA, herein designated GAM RNA, binds com-

plementarily to one or more target binding sites located in untranslated regions of GAM124 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM124 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM124 RNA may have a different number of target binding sites in untranslated regions of a GAM124 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19850] The complementary binding of GAM124 RNA, herein designated GAM RNA, to target binding sites on GAM124 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM124 target RNA into GAM124 tar-

get protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19851] It is appreciated that GAM124 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM124 target genes. The mRNA of each one of this plurality of GAM124 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM124 RNA, herein designated GAM RNA, and which when bound by GAM124 RNA causes inhibition of translation of respective one or more GAM124 target proteins.

[19852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM124 gene, herein designated GAM GENE, on one or more GAM124 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19853] It is appreciated that specific functions and accordingly utilities of GAM124 correlate with, and may be deduced from, the identity of the target genes which GAM124 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19854]

[19855]

[19856] Deltex homolog 1 (drosophila) (DTX1, Accession NM_004416.1) is a GAM124 target gene, herein designated TARGET GENE. DTX1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DTX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DTX1 BINDING SITE, designated SEQ ID:13928, to the nucleotide sequence of GAM124 RNA, herein designated GAM RNA, also designated SEQ ID:323.

[19857] A function of GAM124 is therefore inhibition of Deltex homolog 1 (drosophila) (DTX1, Accession NM_004416.1), a gene which modulates Notch signalling and bHLH transcription factor activity. Accordingly, utilities of GAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTX1.

[19858] The function of DTX1 has been established by previous studies. Using the yeast interaction trap system, Matsuno et al. (1998) found that Drosophila and human deltex bind to the human SH3- domain containing protein GRB2 (OMIM Ref. No. 108355). Results from 2 different reporter assays allowed them for the first time to associate deltex with Notch- dependent transcriptional events. They presented evidence linking deltex to the modulation of basic helix- loop- helix (bHLH) transcription factor activity. After confirming that DTX1 is expressed in T lymphocytes at all stages of development, Izon et al. (2002) showed by RT- PCR analysis that murine Dtx1 is also expressed in hemopoietic stem cells and in B lymphocytes in all stages of development, whereas Notch1 expression is low in these cells. The authors transduced hemopoietic progenitor cells with Dtx1 expressing green fluorescent protein and found that mice with these cells had a marked de-

crease in T cells in the thymus, peripheral blood, and spleen. Instead, the thymus in these mice and in organ culture displayed B- cell development resembling the phenotype of mice deficient in Notch1. Expression of DTX1 partially inhibited transactivation of a CSL (RBPSUH; 147183)- dependent luciferase reporter by activated intracellular NOTCH1 (ICN1) in human and mouse cells. The N terminus of DTX1, which directly interacts with the NOTCH1 ankyrin repeats, inhibited transactivation by ICN1 possessing the ankyrin repeats, probably by inhibiting recruitment of coactivators to the C- terminal transactivation domain of NOTCH1. Izon et al. (2002) concluded that DTX1 is an inhibitor of NOTCH1 activity, a conclusion earlier suggested by the studies of Sestan et al. (1999) on dendritic outgrowth from human neurons.

[19859]

[19860] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19861] Izon, D. J.; Aster, J. C.; He, Y.; Weng, A.; Karnell, F. G.; Patriub, V.; Xu, L.; Bakkour, S.; Rodriguez, C.; Allman, D.; Pear, W. S. : Deltex1 redirects lymphoid progenitors to the B cell lineage by antagonizing Notch1. Immunity 16: 231-

243, 2002. ; and

[19862] Matsuno, K.; Eastman, D.; Mitsiades, T.; Quinn, A. M.; Carcanciu, M. L.; Ordentlich, P.; Kadesch, T.; Artavanis-Tsakonas, S. : Human deltex is a conserved regulator of Notch signalling.

[19863] Further studies establishing the function and utilities of DTX1 are found in John Hopkins OMIM database record ID 602582, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ20695 (Accession) is another GAM124 target gene, herein designated TARGET GENE. FLJ20695 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20695, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20695 BINDING SITE, designated SEQ ID:10484, to the nucleotide sequence of GAM124 RNA, herein designated GAM RNA, also designated SEQ ID:323.

[19864] Another function of GAM124 is therefore inhibition of FLJ20695 (Accession) . Accordingly, utilities of GAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20695.

[19865] Glia maturation factor, beta (GMFB, Accession NM_004124.1) is another GAM124 target gene, herein designated TARGET GENE. GMFB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GMFB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GMFB BINDING SITE, designated SEQ ID:18850, to the nucleotide sequence of GAM124 RNA, herein designated GAM RNA, also designated SEQ ID:323.

[19866] Another function of GAM124 is therefore inhibition of Glia maturation factor, beta (GMFB, Accession NM_004124.1) . Accordingly, utilities of GAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMFB.

[19867] LOC163132 (Accession) is another GAM124 target gene, herein designated TARGET GENE. LOC163132 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC163132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC163132 BINDING SITE, designated SEQ ID:20129, to the nucleotide sequence of GAM124 RNA, herein designated GAM RNA, also designated SEQ ID:323.

[19868] Another function of GAM124 is therefore inhibition of LOC163132 (Accession) . Accordingly, utilities of GAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163132.

[19869] Sterol regulatory element binding transcription factor 1 (SREBF1, Accession NM_004176.2) is another GAM124 target gene, herein designated TARGET GENE. SREBF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SREBF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SREBF1 BINDING SITE, designated SEQ ID:16586, to the nucleotide sequence of GAM124 RNA, herein designated GAM RNA, also designated SEQ ID:323.

[19870] Another function of GAM124 is therefore inhibition of Sterol regulatory element binding transcription factor 1 (SREBF1, Accession NM_004176.2), a gene which is a transcriptional activator that binds to the sterol regulatory el-

ement 1. Accordingly, utilities of GAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SREBF1.

[19871] The function of SREBF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.

[19872] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 125 (GAM125), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19873] GAM125 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM125 was detected is described hereinabove with reference to Figs. 8-15.

[19874] GAM125 gene, herein designated GAM GENE, and GAM125 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19875] GAM125 gene encodes a GAM125 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM125 precur-

sor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM125 precursor RNA is designated SEQ ID:44, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:44 is located at position 6134811 relative to chromosome 6.

[19876] GAM125 precursor RNA folds onto itself, forming GAM125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19877] GAM125 precursor RNA folds onto itself, forming GAM125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nu-

cleotide sequence of the second half thereof.

[19878] Nucleotide sequence of GAM125 precursor RNA, designated SEQ-ID: 44, and a schematic representation of a predicted secondary folding of GAM125 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19879] An enzyme complex designated DICER COMPLEX, `dices` the GAM125 folded precursor RNA into GAM125 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM125 RNA is designated SEQ ID:330, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19880] GAM125 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM125 target RNA, herein designated GAM TARGET RNA. GAM125 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein

coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19881] GAM125 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM125 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM125 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM125 RNA may have a different number of target binding sites in untranslated regions of a GAM125 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19882] The complementary binding of GAM125 RNA, herein designated GAM RNA, to target binding sites on GAM125 tar-

get RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM125 target RNA into GAM125 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19883] It is appreciated that GAM125 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM125 target genes. The mRNA of each one of this plurality of GAM125 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM125 RNA, herein designated GAM RNA, and which when bound by GAM125 RNA causes inhibition of translation of respective one or more GAM125 target proteins.

[19884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM125 gene, herein designated GAM GENE, on one or more GAM125 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the

known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19885] It is appreciated that specific functions and accordingly utilities of GAM125 correlate with, and may be deduced from, the identity of the target genes which GAM125 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19886]

[19887]

[19888] Coagulation factor xiii, a1 polypeptide (F13A1, Accession NM_000129.2) is a GAM125 target gene, herein designated TARGET GENE. F13A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F13A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F13A1 BINDING SITE, designated

SEQ ID:9703, to the nucleotide sequence of GAM125 RNA, herein designated GAM RNA, also designated SEQ ID:330.

[19889] A function of GAM125 is therefore inhibition of Coagulation factor xiii, a1 polypeptide (F13A1, Accession NM_000129.2) . Accordingly, utilities of GAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F13A1.

[19890] MEGF10 (Accession NM_032446.1) is another GAM125 target gene, herein designated TARGET GENE. MEGF10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEGF10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:7443, to the nucleotide sequence of GAM125 RNA, herein designated GAM RNA, also designated SEQ ID:330.

[19891] Another function of GAM125 is therefore inhibition of MEGF10 (Accession NM_032446.1) . Accordingly, utilities of GAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10.

[19892]

[19893] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 126 (GAM126), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19894] GAM126 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM126 was detected is described hereinabove with reference to Figs. 8-15.

[19895] GAM126 gene, herein designated GAM GENE, and GAM126 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19896] GAM126 gene encodes a GAM126 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM126 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM126 precursor RNA is designated SEQ ID:148, and is provided hereinbelow with reference to the sequence listing part.

[19897] GAM126 precursor RNA folds onto itself, forming GAM126 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19898] GAM126 precursor RNA folds onto itself, forming GAM126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19899] Nucleotide sequence of GAM126 precursor RNA, designated SEQ-ID: 148, and a schematic representation of a predicted secondary folding of GAM126 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19900] An enzyme complex designated DICER COMPLEX, `dices` the GAM126 folded precursor RNA into GAM126 RNA,

herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM126 RNA is designated SEQ ID:312, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19901] GAM126 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM126 target RNA, herein designated GAM TARGET RNA. GAM126 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19902] GAM126 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM126 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM126 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM126 RNA may have a different number of target binding sites in untranslated regions of a GAM126 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19903] The complementary binding of GAM126 RNA, herein designated GAM RNA, to target binding sites on GAM126 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM126 target RNA into GAM126 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19904] It is appreciated that GAM126 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM126 target genes. The mRNA of each one of this plu-

rality of GAM126 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM126 RNA, herein designated GAM RNA, and which when bound by GAM126 RNA causes inhibition of translation of respective one or more GAM126 target proteins.

[19905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM126 gene, herein designated GAM GENE, on one or more GAM126 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19906] It is appreciated that specific functions and accordingly

utilities of GAM126 correlate with, and may be deduced from, the identity of the target genes which GAM126 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19907]

[19908]

[19909] P21(cdkn1a)-activated kinase 6 (PAK6, Accession NM_020168.3) is a GAM126 target gene, herein designated TARGET GENE. PAK6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAK6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:7423, to the nucleotide sequence of GAM126 RNA, herein designated GAM RNA, also designated SEQ ID:312.

[19910] A function of GAM126 is therefore inhibition of P21(cdkn1a)-activated kinase 6 (PAK6, Accession NM_020168.3) . Accordingly, utilities of GAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6.

[19911]

[19912] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 127 (GAM127), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19913] GAM127 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM127 was detected is described hereinabove with reference to Figs. 8-15.

[19914] GAM127 gene, herein designated GAM GENE, and GAM127 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19915] GAM127 gene encodes a GAM127 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM127 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM127 precursor RNA is designated SEQ ID:53, and is provided hereinbelow with reference to the sequence listing part.

[19916] GAM127 precursor RNA folds onto itself, forming GAM127 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19917] GAM127 precursor RNA folds onto itself, forming GAM127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19918] Nucleotide sequence of GAM127 precursor RNA, designated SEQ-ID: 53, and a schematic representation of a predicted secondary folding of GAM127 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19919] An enzyme complex designated DICER COMPLEX, `dices` the GAM127 folded precursor RNA into GAM127 RNA,

herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM127 RNA is designated SEQ ID:321, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19920] GAM127 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM127 target RNA, herein designated GAM TARGET RNA. GAM127 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19921] GAM127 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM127 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM127 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM127 RNA may have a different number of target binding sites in untranslated regions of a GAM127 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19922] The complementary binding of GAM127 RNA, herein designated GAM RNA, to target binding sites on GAM127 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM127 target RNA into GAM127 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19923] It is appreciated that GAM127 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM127 target genes. The mRNA of each one of this plu-

rality of GAM127 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM127 RNA, herein designated GAM RNA, and which when bound by GAM127 RNA causes inhibition of translation of respective one or more GAM127 target proteins.

[19924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM127 gene, herein designated GAM GENE, on one or more GAM127 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19925] It is appreciated that specific functions and accordingly

utilities of GAM127 correlate with, and may be deduced from, the identity of the target genes which GAM127 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19926]

[19927]

[19928] SPK (Accession NM_004819.1) is a GAM127 target gene, herein designated TARGET GENE. SPK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SPK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPK BINDING SITE, designated SEQ ID:12856, to the nucleotide sequence of GAM127 RNA, herein designated GAM RNA, also designated SEQ ID:321.

[19929] A function of GAM127 is therefore inhibition of SPK (Accession NM_004819.1) . Accordingly, utilities of GAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPK.

[19930] Vamp (vesicle-associated membrane protein)-associated protein a, 33kda (VAPA, Accession NM_003574.2) is an-

other GAM127 target gene, herein designated TARGET GENE. VAPA BINDING SITE1 and VAPA BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by VAPA, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VAPA BINDING SITE1 and VAPA BINDING SITE2, designated SEQ ID:11936 and SEQ ID:2734 respectively, to the nucleotide sequence of GAM127 RNA, herein designated GAM RNA, also designated SEQ ID:321.

[19931] Another function of GAM127 is therefore inhibition of Vamp (vesicle-associated membrane protein)-associated protein a, 33kda (VAPA, Accession NM_003574.2), a gene which may have a role in vesicle trafficking. Accordingly, utilities of GAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAPA.

[19932] The function of VAPA has been established by previous studies. By searching an EST database for human homologs of the Aplysia 33- kD VAMP- associated protein (Vap33), Weir et al. (1998) identified a cDNA encoding VAPA, which they termed VAP33. Sequence analysis pre-

dicted that the 242- amino acid protein, which is 50% identical to the molluscan sequence, contains 8 potential phosphorylation sites, an alpha- helical coiled- coil domain, and a C- terminal transmembrane domain. Northern blot analysis of mouse tissues detected a major 1.9- kb transcript and minor 3.9- and 7.1- kb transcripts in all tissues tested, with highest expression in brain, testis, ovary, kidney and skeletal muscle. In contrast, Vap33 expression is neuron specific in Aplysia. Western blot analysis showed that VAPA interacts with VAMP1 (OMIM Ref. No. 185880) and VAMP2 (OMIM Ref. No. 185881) but not with SNAP25 (OMIM Ref. No. 600322). Nishimura et al. (1999) identified cDNAs encoding VAPA and the 60% homologous VAPB (OMIM Ref. No. 605704). Northern blot analysis detected a 1.7- kb VAPA transcript in all human tissues tested. SDS- PAGE analysis demonstrated that the transmembrane domain of recombinant VAPA interacted with VAPA and VAPB fusion proteins.

[19933]

[19934] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19935] Weir, M. L.; Klip, A.; Trimble, W. S. : Identification of a hu-

man homologue of the vesicle- associated membrane protein (VAMP)- associated protein of 33 kDa (VAP- 33): a broadly expressed protein that binds to VAMP. Biochem. J. 333: 247- 251, 1998. ; and

[19936] Nishimura, Y.; Hayashi, M.; Inada, H.; Tanaka, T. : Molecular cloning and characterization of mammalian homologues of vesicle- associated membrane protein- associated (VAMP- associated) prote.

[19937] Further studies establishing the function and utilities of VAPA are found in John Hopkins OMIM database record ID 605703, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[19938] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 128 (GAM128), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19939] GAM128 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM128 was detected is described hereinabove with reference to Figs. 8-15.

[19940] GAM128 gene, herein designated GAM GENE, and

GAM128 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19941] GAM128 gene encodes a GAM128 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM128 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM128 precursor RNA is designated SEQ ID:168, and is provided hereinbelow with reference to the sequence listing part.

[19942] GAM128 precursor RNA folds onto itself, forming GAM128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19943] GAM128 precursor RNA folds onto itself, forming GAM128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19944] Nucleotide sequence of GAM128 precursor RNA, designated SEQ-ID: 168, and a schematic representation of a predicted secondary folding of GAM128 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19945] An enzyme complex designated DICER COMPLEX, `dices` the GAM128 folded precursor RNA into GAM128 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM128 RNA is designated SEQ ID:316, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19946] GAM128 target gene, herein designated TARGET GENE,

encodes a corresponding messenger RNA, GAM128 target RNA, herein designated GAM TARGET RNA. GAM128 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19947] GAM128 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM128 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM128 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM128 RNA may have a different number of target binding sites in untranslated regions of a GAM128 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19948] The complementary binding of GAM128 RNA, herein designated GAM RNA, to target binding sites on GAM128 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM128 target RNA into GAM128 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19949] It is appreciated that GAM128 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM128 target genes. The mRNA of each one of this plurality of GAM128 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM128 RNA, herein designated GAM RNA, and which when bound by GAM128 RNA causes inhibition of translation of respective one or more GAM128 target proteins.

[19950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM128 gene, herein designated GAM GENE, on one or more GAM128 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19951] It is appreciated that specific functions and accordingly utilities of GAM128 correlate with, and may be deduced from, the identity of the target genes which GAM128 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19952]

[19953]

[19954] A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 8 (ADAMTS8, Accession NM_007037.2) is a GAM128 target gene, herein designated TARGET GENE. ADAMTS8 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by ADAMTS8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS8 BINDING SITE, designated SEQ ID:7148, to the nucleotide sequence of GAM128 RNA, herein designated GAM RNA, also designated SEQ ID:316.

[19955] A function of GAM128 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 8 (ADAMTS8, Accession NM_007037.2), a gene which has anti- angiogenic properties. Accordingly, utilities of GAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS8.

[19956] The function of ADAMTS8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.ATP6M8-9 (Accession) is another GAM128 target gene, herein designated TARGET GENE. ATP6M8-9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP6M8-9, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6M8-9 BINDING SITE, designated SEQ ID:6599, to the nucleotide sequence of GAM128 RNA, herein designated GAM RNA, also designated SEQ ID:316.

[19957] Another function of GAM128 is therefore inhibition of ATP6M8-9 (Accession) . Accordingly, utilities of GAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6M8-9.

[19958] Herv-h ltr-associating 2 (HHLA2, Accession) is another GAM128 target gene, herein designated TARGET GENE. HHLA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HHLA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HHLA2 BINDING SITE, designated SEQ ID:16378, to the nucleotide sequence of GAM128 RNA, herein designated GAM RNA, also designated SEQ ID:316.

[19959] Another function of GAM128 is therefore inhibition of Herv-h ltr-associating 2 (HHLA2, Accession) . Accordingly, utilities of GAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with HHLA2.

[19960] KIAA0515 (Accession) is another GAM128 target gene, herein designated TARGET GENE. KIAA0515 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0515, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:2335, to the nucleotide sequence of GAM128 RNA, herein designated GAM RNA, also designated SEQ ID:316.

[19961] Another function of GAM128 is therefore inhibition of KIAA0515 (Accession) . Accordingly, utilities of GAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515.

[19962]

[19963] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 129 (GAM129), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19964] GAM129 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM129 was detected is described hereinabove with reference to Figs. 8-15.

[19965] GAM129 gene, herein designated GAM GENE, and GAM129 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[19966] GAM129 gene encodes a GAM129 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM129 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM129 precursor RNA is designated SEQ ID:181, and is provided hereinbelow with reference to the sequence listing part.

[19967] GAM129 precursor RNA folds onto itself, forming GAM129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19968] GAM129 precursor RNA folds onto itself, forming GAM129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[19969] Nucleotide sequence of GAM129 precursor RNA, designated SEQ-ID: 181, and a schematic representation of a predicted secondary folding of GAM129 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[19970] An enzyme complex designated DICER COMPLEX, `dices` the GAM129 folded precursor RNA into GAM129 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM129 RNA is desig-

nated SEQ ID:213, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[19971] GAM129 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM129 target RNA, herein designated GAM TARGET RNA. GAM129 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19972] GAM129 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM129 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM129 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM129 RNA may have a different number of target

binding sites in untranslated regions of a GAM129 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19973] The complementary binding of GAM129 RNA, herein designated GAM RNA, to target binding sites on GAM129 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM129 target RNA into GAM129 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19974] It is appreciated that GAM129 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM129 target genes. The mRNA of each one of this plurality of GAM129 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM129 RNA, herein designated GAM RNA, and which when bound by GAM129 RNA causes inhibition of translation of respective one or more GAM129 target proteins.

[19975] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM129 gene, herein designated GAM GENE, on one or more GAM129 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19976] It is appreciated that specific functions and accordingly utilities of GAM129 correlate with, and may be deduced from, the identity of the target genes which GAM129 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19977]

[19978]

[19979] A disintegrin and metalloproteinase domain 19 (meltrin beta) (ADAM19, Accession NM_033274.1) is a GAM129 target gene, herein designated TARGET GENE. ADAM19 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM19 BINDING SITE, designated SEQ ID:14108, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[19980] A function of GAM129 is therefore inhibition of A disintegrin and metalloproteinase domain 19 (meltrin beta) (ADAM19, Accession NM_033274.1), a gene which participates in the proteolytic processing of beta- type neuregulin isoforms . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM19.

[19981] The function of ADAM19 has been established by previous studies. Members of the ADAM family are cell surface proteins containing a disintegrin cell adhesion domain and a metalloproteinase domain. Inoue et al. (1998) cloned full-

length cDNAs of mouse Adam19, which they referred to as meltrin- beta (see OMIM Ref. No. ADAM12, 602714). The ADAM19 gene encodes a 920- amino acid polypeptide, and Inoue et al. (1998) found that its sequence was most similar to ADAM12 and ADAM13. Northern blot analysis revealed that a major 6.5- kb transcript was expressed in all mouse tissues tested. Hirohata et al. (1998) used radiation hybrids to map ADAM19 to mouse chromosome 11 and to human chromosome 5q32- q33.

[19982]

[19983] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19984] Hirohata, S.; Seldin, M. F.; Apte, S. S. : Chromosomal assignment of two ADAM genes, TACE (ADAM17) and MLTNB (ADAM19), to human chromosomes 2 and 5, respectively, and of Mltnb to mouse chromosome 11. Genomics 54: 178- 179, 1998. ; and

[19985] Inoue, D.; Reid, M.; Lum, L.; Kratzschmar, J.; Weskamp, G.; Myung, Y. M.; Baron, R.; Blobel, C. P. : Cloning and initial characterization of mouse meltrin beta and analysis of the expre.

[19986] Further studies establishing the function and utilities of

ADAM19 are found in John Hopkins OMIM database record ID 603640, and in cited publications listed in Table 5, which are hereby incorporated by reference.A disintegrin and metalloproteinase domain 8 (ADAM8, Accession NM_001109.1) is another GAM129 target gene, herein designated TARGET GENE. ADAM8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAM8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM8 BINDING SITE, designated SEQ ID:17299, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[19987] Another function of GAM129 is therefore inhibition of A disintegrin and metalloproteinase domain 8 (ADAM8, Accession NM_001109.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM8.

[19988] Aquaporin 6, kidney specific (AQP6, Accession NM_053286.1) is another GAM129 target gene, herein designated TARGET GENE. AQP6 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by AQP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:3804, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[19989] Another function of GAM129 is therefore inhibition of Aquaporin 6, kidney specific (AQP6, Accession NM_053286.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6.

[19990] The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.Atp synthase, h+ transporting, mitochondrial f1 complex, delta subunit (ATP5D, Accession NM_001687.1) is another GAM129 target gene, herein designated TARGET GENE. ATP5D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by ATP5D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP5D BINDING SITE, designated SEQ ID:13370, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[19991] Another function of GAM129 is therefore inhibition of Atp synthase, h+ transporting, mitochondrial f1 complex, delta subunit (ATP5D, Accession NM_001687.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP5D.

[19992] Beta-site app-cleaving enzyme (BACE, Accession NM_138973.1) is another GAM129 target gene, herein designated TARGET GENE. BACE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE, designated SEQ ID:16749, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA,

also designated SEQ ID:213.

[19993] Another function of GAM129 is therefore inhibition of Beta-site app-cleaving enzyme (BACE, Accession NM_138973.1), a gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with BACE.

[19994] The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Brca1 associated protein-1 (ubiquitin carboxy-terminal hydrolase) (BAP1, Accession NM_004656.2) is another GAM129 target gene, herein designated TARGET GENE. BAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAP1 BINDING SITE, designated SEQ ID:14852, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[19995] Another function of GAM129 is therefore inhibition of Brca1 associated protein-1 (ubiquitin carboxy-terminal hydrolase) (BAP1, Accession NM_004656.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAP1.

[19996] Burkitt lymphoma receptor 1, gtp binding protein (chemokine (c-x-c motif) receptor 5) (BLR1, Accession NM_001716.2) is another GAM129 target gene, herein designated TARGET GENE. BLR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BLR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BLR1 BINDING SITE, designated SEQ ID:17913, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[19997] Another function of GAM129 is therefore inhibition of Burkitt lymphoma receptor 1, gtp binding protein (chemokine (c-x-c motif) receptor 5) (BLR1, Accession NM_001716.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with BLR1.

[19998] Chromosome 1 open reading frame 1 (C1orf1, Accession NM_001213.1) is another GAM129 target gene, herein designated TARGET GENE. C1orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf1 BINDING SITE, designated SEQ ID:1462, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[19999] Another function of GAM129 is therefore inhibition of Chromosome 1 open reading frame 1 (C1orf1, Accession NM_001213.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf1.

[20000] Chromosome 1 open reading frame 17 (C1orf17, Accession NM_015101.1) is another GAM129 target gene, herein designated TARGET GENE. C1orf17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of C1orf17 BINDING SITE, designated SEQ ID:8671, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20001] Another function of GAM129 is therefore inhibition of Chromosome 1 open reading frame 17 (C1orf17, Accession NM_015101.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf17.

[20002] Cd44 antigen (homing function and indian blood group system) (CD44, Accession NM_000610.2) is another GAM129 target gene, herein designated TARGET GENE. CD44 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CD44, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD44 BINDING SITE, designated SEQ ID:12215, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20003] Another function of GAM129 is therefore inhibition of Cd44 antigen (homing function and indian blood group system) (CD44, Accession NM_000610.2), a gene which is

main cell surface receptor for hyaluronate, and involves in matrix adhesion, lymphocyte activation and lymph node homing. and therefore may be associated with Tumor. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of Tumor, and of other diseases and clinical conditions associated with CD44.

[20004] The function of CD44 has been established by previous studies. Weber et al. (1996) noted that the CD44 gene encodes a transmembrane protein that is expressed as a family of molecular isoforms generated from alternative RNA splicing and posttranslational modifications. Certain CD44 isoforms that regulate activation and migration of lymphocytes and macrophages may also enhance local growth and metastatic spread of tumor cells. One ligand of CD44 is hyaluronic acid, binding of which to the NH2-terminal domain of CD44 enhances cellular aggregation and tumor cell growth. (Krainer et al. (1991) referred to CD44 as a 'hyaladherin' - - see 601269.) Weber et al. (1996) demonstrated that another ligand is osteopontin (OMIM Ref. No. 166490). Osteopontin induces cellular chemotaxis but not homotypic aggregation of cells, whereas the inverse is true for the interaction between CD44 and hyaluronate. The alternative responses to CD44

ligation may be exploited by tumor cells to allow OPN-mediated metastatic spread and hyaluronate- dependent growth in newly colonized tissues in the process of tumor metastasis

[20005] Animal model experiments lend further support to the function of CD44. Schmits et al. (1997) generated mice deficient in all known isoforms of Cd44 by targeting exons encoding the invariant N- terminal region of the molecule. Mice were born in mendelian ratio without any obvious developmental or neurologic deficits. Hematologic impairment was evidenced by altered tissue distribution of myeloid progenitors with increased levels of colony- forming unit- granulocyte- macrophage in bone marrow and reduced numbers in spleen. Fetal liver colony- forming unit- spleen and granulocyte colony-stimulating factor mobilization assays, together with reduced colony- forming unit- granulocyte- macrophage in peripheral blood, suggested that progenitor egress from the bone marrow was defective. Mice also developed exaggerated granuloma responses to Cryotosporidium parvum infection. Tumor studies showed that SV40-transformed Cd44- deficient fibroblasts were highly tumorigenic in nude mice, whereas reintroduction of Cd44

expression into these fibroblasts resulted in a dramatic inhibition of tumor growth.

[20006] It is appreciated that the abovementioned animal model for CD44 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[20007] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20008] Weber, G. F.; Ashkar, S.; Glimcher, M. J.; Cantor, H. : Receptor- ligand interaction between CD44 and osteopontin (Eta- 1). Science 271: 509- 512, 1996. ; and

[20009] Schmits, R.; Filmus, J.; Gerwin, N.; Senaldi, G.; Kiefer, F.; Kundig, T.; Wakeham, A.; Shahinian, A.; Catzavelos, C.; Rak, J.; Furlonger, C.; Zakarian, A.; Simard, J. J.; Ohashi, P. S.

[20010] Further studies establishing the function and utilities of CD44 are found in John Hopkins OMIM database record ID 107269, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NM_033332.1) is another GAM129 target gene, herein designated TARGET GENE. CDC14B BINDING SITE is a tar-

get binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:2869, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20011] Another function of GAM129 is therefore inhibition of Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NM_033332.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B.

[20012] DDM36 (Accession) is another GAM129 target gene, herein designated TARGET GENE. DDM36 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DDM36, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDM36 BINDING SITE, designated SEQ ID:9225, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:213.

[20013] Another function of GAM129 is therefore inhibition of DDM36 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDM36.

[20014] Dead/h (asp-glu-ala-asp/his) box polypeptide 37 (DDX37, Accession NM_032656.2) is another GAM129 target gene, herein designated TARGET GENE. DDX37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DDX37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX37 BINDING SITE, designated SEQ ID:8055, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20015] Another function of GAM129 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 37 (DDX37, Accession NM_032656.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX37.

[20016] DKFZP434P0111 (Accession XM_041116.4) is another GAM129 target gene, herein designated TARGET GENE.

DKFZP434P0111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:1216, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20017] Another function of GAM129 is therefore inhibition of DKFZP434P0111 (Accession XM_041116.4) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111.

[20018] DKFZp434P0531 (Accession XM_166410.3) is another GAM129 target gene, herein designated TARGET GENE. DKFZp434P0531 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434P0531, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434P0531 BINDING SITE, designated SEQ ID:18911, to the nucleotide sequence of

GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20019] Another function of GAM129 is therefore inhibition of DKFZp434P0531 (Accession XM_166410.3) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434P0531.

[20020] DKFZp547O146 (Accession NM_020224.1) is another GAM129 target gene, herein designated TARGET GENE. DKFZp547O146 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp547O146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547O146 BINDING SITE, designated SEQ ID:5182, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20021] Another function of GAM129 is therefore inhibition of DKFZp547O146 (Accession NM_020224.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547O146.

[20022] Deoxynucleotidyltransferase, terminal (DNTT, Accession NM_004088.2) is another GAM129 target gene, herein designated TARGET GENE. DNTT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNTT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNTT BINDING SITE, designated SEQ ID:14883, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20023] Another function of GAM129 is therefore inhibition of Deoxynucleotidyltransferase, terminal (DNTT, Accession NM_004088.2), a gene which is terminal deoxynucleotidyl transferase. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNTT.

[20024] The function of DNTT has been established by previous studies. Among other considerations, Epplen et al. (1987) discussed the role of terminal transferase in the generation of diversity of T- cell receptor genes. As in humans, the mouse Dntt protein, containing 509 amino acids and encoded by 12 exons, contributes to Ig and T cell receptor

diversity by catalyzing the addition of nontemplated nucleotides (N addition) at the junctions of gene segments. Thai et al. (2002) showed that in mouse the long form of Dntt, termed TdTL and containing 529 amino acids, is also involved in the generation of diversity by catalyzing the deletion of nucleotides at coding joins through a 3- prime- to- 5- prime exonuclease activity. Searches of private and public databases revealed that 2 long isoforms possessing conserved exonuclease core motifs of DNTT also exist in humans and cattle, suggesting that this activity may also modify joining segments in these species.

[20025]

[20026] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20027] Epplen, J. T.; Chluba, J.; Hardt, C.; Hinkkanen, A.; Steimle, V.; Stockinger, H. : Mammalian T- lymphocyte antigen receptor genes: genetic and nongenetic potential to generate variability. Hum. Genet. 75: 300- 310, 1987. ; and

[20028] Thai, T.- H.; Purugganan, M. M.; Roth, D. B.; Kearney, J. F. : Distinct and opposite diversifying activities of terminal transferase splice variants. Nature Immun. 3: 457- 462, 2002.

[20029] Further studies establishing the function and utilities of DNTT are found in John Hopkins OMIM database record ID 187410, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dedicator of cyto-kinesis 1 (DOCK1, Accession NM_001380.1) is another GAM129 target gene, herein designated TARGET GENE. DOCK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DOCK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DOCK1 BINDING SITE, designated SEQ ID:8758, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20030] Another function of GAM129 is therefore inhibition of Dedicator of cyto-kinesis 1 (DOCK1, Accession NM_001380.1), a gene which may function in the extension of cell surfaces. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK1.

[20031] The function of DOCK1 has been established by previous studies. The CRK protein (OMIM Ref. No. 164762), comprised mostly of SH2 and SH3 src- homology domains,

has an important role in signaling from focal adhesions. Along with other adaptor proteins such as GRB2 (OMIM Ref. No. 108355) and NCK (OMIM Ref. No. 600508), it receives signals through its SH2 domains from phosphotyrosine- containing peptides and transfers them to other proteins bound to its SH3 domains. Among proteins that bind to the SH3 domain of CRK are C3G (OMIM Ref. No. 600303), a guanine nucleotide exchange protein for RAP1 (OMIM Ref. No. 600278), and the 180- kD DOCK (downstream of CRK) protein. Hasegawa et al. (1996) isolated a cDNA for DOCK by screening an expression library with CRK SH3. They found a full- length cDNA that encodes a putative 1,866- amino acid polypeptide with an SH3 domain at its amino end. Northern blots showed a 7.6- kb transcript that was expressed in most tissues and most strongly in placenta, lungs, kidney, and pancreas. Wildtype DOCK180 was found in the cytoplasm and did not affect cell morphology. However, when farnesylated, the protein became associated with the cytoplasmic membrane and made spindle 3T3 cells become flattened and polygonal. Takai et al. (1996) mapped DOCK180 to 10q26.13- q26.3 by fluorescence in situ hybridization. During programmed cell death (apoptosis), cell corpses

are rapidly engulfed. This engulfment process involves the recognition and subsequent phagocytosis of cell corpses by engulfing cells. Wu and Horvitz (1998) shed light on the previously obscure mechanisms by which cell corpses are engulfed. They reported that ced- 5, a gene that is required for cell- corpse engulfment in the nematode Caenorhabditis elegans, encodes a protein that is similar to the human protein DOCK180 and the Drosophila melanogaster protein Myoblast City (MBC), both of which had been implicated in the extension of cell surfaces. C. elegans ced- 5 mutants were defective not only in the engulfment of cell corpses but also in the migrations of 2 specific gonadal cells, the distal tip cells. The expression of human DOCK180 in C. elegans rescued the cell- migration defect of a ced- 5 mutant. Wu and Horvitz (1998) presented evidence that ced- 5 functions in engulfing cells during the engulfment of cell corpses. They suggested that ced- 5 acts in the extension of the surface of an engulfing cell around a dying cell during programmed cell death. They named the new family of proteins that function in the extension of cell surfaces the CDM (for CED- 5, DOCK180, and MBC) family.

[20032]

[20033] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20034] Savill, J. : Phagocytic docking without shocking. Nature 442- 443, 1998. ; and

[20035] Takai, S.; Hasegawa, H.; Kiyokawa, E.; Yamada, K.; Kurata, T.; Matsuda, M. : Chromosomal mapping of the gene encoding DOCK180, a major Crk- binding protein, to 10q26.13- q26.3 by fluoresc.

[20036] Further studies establishing the function and utilities of DOCK1 are found in John Hopkins OMIM database record ID 601403, and in cited publications listed in Table 5, which are hereby incorporated by reference.DT1P1A10 (Accession NM_058163.1) is another GAM129 target gene, herein designated TARGET GENE. DT1P1A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DT1P1A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DT1P1A10 BINDING SITE, designated SEQ ID:19425, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20037] Another function of GAM129 is therefore inhibition of DT1P1A10 (Accession NM_058163.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DT1P1A10.

[20038] E1B-AP5 (Accession NM_144732.1) is another GAM129 target gene, herein designated TARGET GENE. E1B-AP5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by E1B-AP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of E1B-AP5 BINDING SITE, designated SEQ ID:11392, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20039] Another function of GAM129 is therefore inhibition of E1B-AP5 (Accession NM_144732.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E1B-AP5.

[20040] Fibroblast growth factor receptor 3 (achondroplasia, thanatophoric dwarfism) (FGFR3, Accession NM_000142.2)

is another GAM129 target gene, herein designated TARGET GENE. FGFR3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FGFR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGFR3 BINDING SITE, designated SEQ ID:7492, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20041] Another function of GAM129 is therefore inhibition of Fibroblast growth factor receptor 3 (achondroplasia, thanatophoric dwarfism) (FGFR3, Accession NM_000142.2). Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR3.

[20042] FLJ10204 (Accession NM_018024.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ10204 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ10204 BINDING SITE, designated SEQ ID:18329, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20043] Another function of GAM129 is therefore inhibition of FLJ10204 (Accession NM_018024.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10204.

[20044] FLJ11362 (Accession NM_021946.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ11362 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11362, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11362 BINDING SITE, designated SEQ ID:10040, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20045] Another function of GAM129 is therefore inhibition of FLJ11362 (Accession NM_021946.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11362.

[20046] FLJ12783 (Accession) is another GAM129 target gene, herein designated TARGET GENE. FLJ12783 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12783, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12783 BINDING SITE, designated SEQ ID:15286, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20047] Another function of GAM129 is therefore inhibition of FLJ12783 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12783.

[20048] FLJ14249 (Accession NM_106552.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ14249 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ14249, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14249 BINDING SITE, designated SEQ ID:7701, to the nucleotide sequence of GAM129 RNA,

herein designated GAM RNA, also designated SEQ ID:213.

[20049] Another function of GAM129 is therefore inhibition of FLJ14249 (Accession NM_106552.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249.

[20050] FLJ14594 (Accession NM_032808.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ14594 BINDING SITE1 and FLJ14594 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ14594, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14594 BINDING SITE1 and FLJ14594 BINDING SITE2, designated SEQ ID:13720 and SEQ ID:10977 respectively, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20051] Another function of GAM129 is therefore inhibition of FLJ14594 (Accession NM_032808.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14594.

[20052] FLJ21135 (Accession NM_024866.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ21135 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21135, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21135 BINDING SITE, designated SEQ ID:7521, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20053] Another function of GAM129 is therefore inhibition of FLJ21135 (Accession NM_024866.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21135.

[20054] FLJ22474 (Accession) is another GAM129 target gene, herein designated TARGET GENE. FLJ22474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22474 BINDING SITE, designated SEQ ID:20015, to the nucleotide

sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20055] Another function of GAM129 is therefore inhibition of FLJ22474 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22474.

[20056] FLJ22814 (Accession NM_024916.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ22814 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22814, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:9345, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20057] Another function of GAM129 is therefore inhibition of FLJ22814 (Accession NM_024916.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22814.

[20058] FLJ30213 (Accession NM_145008.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ30213

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ30213, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30213 BINDING SITE, designated SEQ ID:17139, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20059] Another function of GAM129 is therefore inhibition of FLJ30213 (Accession NM_145008.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30213.

[20060] FLJ32818 (Accession NM_144685.1) is another GAM129 target gene, herein designated TARGET GENE. FLJ32818 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32818, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32818 BINDING SITE, designated SEQ ID:16718, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20061] Another function of GAM129 is therefore inhibition of FLJ32818 (Accession NM_144685.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32818.

[20062] FUS1 (Accession NM_007275.1) is another GAM129 target gene, herein designated TARGET GENE. FUS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUS1 BINDING SITE, designated SEQ ID:12680, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20063] Another function of GAM129 is therefore inhibition of FUS1 (Accession NM_007275.1), a gene which may function as a tumor suppressor. and therefore may be associated with Lung cancer. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of Lung cancer., and of other diseases and clinical conditions associated with FUS1.

[20064] The function of FUS1 has been established by previous

studies. Lerman and Minna (2000) identified a FUS1 mutation in 2 nonsmall cell lung cancer (NSCLC) cell lines that resulted in a 28- bp truncation at the 3- prime end of exon 2 and a predicted protein of only 82 amino acids. Using SSCP and CpG island promoter methylation analyses, Kondo et al. (2001) failed to detect mutations, polymorphisms, or methylation of FUS1 in lung cancer specimens. Western blot analysis indicated low or no expression of FUS1 in lung cancer cell lines. Overexpression of transfected wildtype but not mutant FUS1 in NSCLCs led to the detection of an approximately 20- kD protein and a dramatic reduction in colony- forming cells. Ecdysone-induced expression of FUS1 had the same effects. Flow cytometric analysis indicated that the arrest occurred in G1 phase.

[20065]

[20066] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20067] Kondo, M.; Ji, L.; Kamibayashi, C.; Tomizawa, Y.; Randle, D.; Sekido, Y.; Yokota, J.; Kashuba, V.; Zabarovsky, E.; Kuzmin, I.; Lerman, M.; Roth, J.; Minna, J. D. : Overexpression of candidate tumor suppressor gene FUS1 isolated

from the 3p21.3 homozygous deletion region leads to G1 arrest and growth inhibition of lung cancer cells. Oncogene 20: 6258- 6262, 2001. ; and

[20068] Lerman, M. I.; Minna, J. D. : The 630- kb lung cancer homozygous deletion region on human chromosome 3p21.3: identification and evaluation of the resident candidate tumor suppressor gen.

[20069] Further studies establishing the function and utilities of FUS1 are found in John Hopkins OMIM database record ID 607052, and in cited publications listed in Table 5, which are hereby incorporated by reference.Grb2-associated binding protein 2 (GAB2, Accession NM_080491.1) is another GAM129 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:9984, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20070] Another function of GAM129 is therefore inhibition of

Grb2-associated binding protein 2 (GAB2, Accession NM_080491.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[20071] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Grb2-associated binding protein 3 (GAB3, Accession NM_080612.1) is another GAM129 target gene, herein designated TARGET GENE. GAB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:18513, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20072] Another function of GAM129 is therefore inhibition of Grb2-associated binding protein 3 (GAB3, Accession NM_080612.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GAB3.

[20073] Glucocorticoid receptor dna binding factor 1 (GRLF1, Accession NM_024342.1) is another GAM129 target gene, herein designated TARGET GENE. GRLF1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GRLF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:5059, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20074] Another function of GAM129 is therefore inhibition of Glucocorticoid receptor dna binding factor 1 (GRLF1, Accession NM_024342.1), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1.

[20075] The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM68.1.Integrin, alpha m (complement component

receptor 3, alpha; also known as cd11b (p170), macrophage antigen alpha polypeptide) (ITGAM, Accession NM_000632.2) is another GAM129 target gene, herein designated TARGET GENE. ITGAM BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ITGAM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGAM BINDING SITE, designated SEQ ID:578, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20076] Another function of GAM129 is therefore inhibition of Integrin, alpha m (complement component receptor 3, alpha; also known as cd11b (p170), macrophage antigen alpha polypeptide) (ITGAM, Accession NM_000632.2), a gene which is invovled in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement- coated particles. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAM.

[20077] The function of ITGAM and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.Potassium channel, subfamily k, member 5 (KCNK5, Accession NM_003740.2) is another GAM129 target gene, herein designated TARGET GENE. KCNK5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KCNK5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK5 BINDING SITE, designated SEQ ID:14609, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20078] Another function of GAM129 is therefore inhibition of Potassium channel, subfamily k, member 5 (KCNK5, Accession NM_003740.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK5.

[20079] KIAA0014 (Accession NM_014665.1) is another GAM129 target gene, herein designated TARGET GENE. KIAA0014 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0014, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:10733, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20080] Another function of GAM129 is therefore inhibition of KIAA0014 (Accession NM_014665.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014.

[20081] KIAA0544 (Accession) is another GAM129 target gene, herein designated TARGET GENE. KIAA0544 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0544, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:20182, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20082] Another function of GAM129 is therefore inhibition of KIAA0544 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with KIAA0544.

[20083] KIAA0682 (Accession NM_014852.1) is another GAM129 target gene, herein designated TARGET GENE. KIAA0682 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0682, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:5701, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20084] Another function of GAM129 is therefore inhibition of KIAA0682 (Accession NM_014852.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682.

[20085] KIAA1086 (Accession XM_047610.1) is another GAM129 target gene, herein designated TARGET GENE. KIAA1086 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1086, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1086 BINDING SITE, designated SEQ ID:4946, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20086] Another function of GAM129 is therefore inhibition of KIAA1086 (Accession XM_047610.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1086.

[20087] KIAA1509 (Accession XM_029353.1) is another GAM129 target gene, herein designated TARGET GENE. KIAA1509 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1509, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:16666, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20088] Another function of GAM129 is therefore inhibition of KIAA1509 (Accession XM_029353.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509.

[20089] Leucine-rich repeat lgi family, member 3 (LGI3, Accession NM_139278.1) is another GAM129 target gene, herein designated TARGET GENE. LGI3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LGI3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGI3 BINDING SITE, designated SEQ ID:1973, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20090] Another function of GAM129 is therefore inhibition of Leucine-rich repeat lgi family, member 3 (LGI3, Accession NM_139278.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI3.

[20091] Lim homeobox protein 1 (LHX1, Accession NM_005568.1) is another GAM129 target gene, herein designated TARGET GENE. LHX1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LHX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LHX1 BINDING SITE, designated SEQ

ID:20027, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20092] Another function of GAM129 is therefore inhibition of Lim homeobox protein 1 (LHX1, Accession NM_005568.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX1.

[20093] LOC123591 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC123591 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC123591, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123591 BINDING SITE, designated SEQ ID:3821, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20094] Another function of GAM129 is therefore inhibition of LOC123591 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123591.

[20095] LOC133383 (Accession) is another GAM129 target gene,

herein designated TARGET GENE. LOC133383 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC133383, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133383 BINDING SITE, designated SEQ ID:19811, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20096] Another function of GAM129 is therefore inhibition of LOC133383 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133383.

[20097] LOC135763 (Accession NM_138572.1) is another GAM129 target gene, herein designated TARGET GENE. LOC135763 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135763, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:19358, to the nucleotide sequence of GAM129 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:213.

[20098] Another function of GAM129 is therefore inhibition of LOC135763 (Accession NM_138572.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135763.

[20099] LOC139522 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC139522 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC139522, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC139522 BINDING SITE, designated SEQ ID:11437, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20100] Another function of GAM129 is therefore inhibition of LOC139522 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139522.

[20101] LOC143286 (Accession XM_096412.1) is another GAM129 target gene, herein designated TARGET GENE. LOC143286

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143286 BINDING SITE, designated SEQ ID:6932, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20102] Another function of GAM129 is therefore inhibition of LOC143286 (Accession XM_096412.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143286.

[20103] LOC144308 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC144308 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144308, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:916, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20104] Another function of GAM129 is therefore inhibition of LOC144308 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144308.

[20105] LOC145622 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC145622 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:12662, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20106] Another function of GAM129 is therefore inhibition of LOC145622 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622.

[20107] LOC146272 (Accession XM_085396.1) is another GAM129 target gene, herein designated TARGET GENE. LOC146272 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC146272, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146272 BINDING SITE, designated SEQ ID:2022, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20108] Another function of GAM129 is therefore inhibition of LOC146272 (Accession XM_085396.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146272.

[20109] LOC146861 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC146861 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146861, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146861 BINDING SITE, designated SEQ ID:4445, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20110] Another function of GAM129 is therefore inhibition of

LOC146861 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146861.

[20111] LOC147118 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC147118 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147118, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147118 BINDING SITE, designated SEQ ID:16773, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20112] Another function of GAM129 is therefore inhibition of LOC147118 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147118.

[20113] LOC147276 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC147276 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147276, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147276 BINDING SITE, designated SEQ ID:14610, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20114] Another function of GAM129 is therefore inhibition of LOC147276 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147276.

[20115] LOC148089 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC148089 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148089, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148089 BINDING SITE, designated SEQ ID:11808, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20116] Another function of GAM129 is therefore inhibition of LOC148089 (Accession) . Accordingly, utilities of

GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148089.

[20117] LOC150174 (Accession XM_086802.3) is another GAM129 target gene, herein designated TARGET GENE. LOC150174 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:14548, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20118] Another function of GAM129 is therefore inhibition of LOC150174 (Accession XM_086802.3) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174.

[20119] LOC150213 (Accession XM_059324.2) is another GAM129 target gene, herein designated TARGET GENE. LOC150213 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150213, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:16131, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20120] Another function of GAM129 is therefore inhibition of LOC150213 (Accession XM_059324.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213.

[20121] LOC150343 (Accession XM_086823.1) is another GAM129 target gene, herein designated TARGET GENE. LOC150343 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150343, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150343 BINDING SITE, designated SEQ ID:5518, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20122] Another function of GAM129 is therefore inhibition of LOC150343 (Accession XM_086823.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150343.

[20123] LOC157531 (Accession XM_098772.1) is another GAM129 target gene, herein designated TARGET GENE. LOC157531 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC157531, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157531 BINDING SITE, designated SEQ ID:2356, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20124] Another function of GAM129 is therefore inhibition of LOC157531 (Accession XM_098772.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157531.

[20125] LOC161734 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC161734 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC161734, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC161734 BINDING SITE, designated SEQ ID:8474, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20126] Another function of GAM129 is therefore inhibition of LOC161734 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161734.

[20127] LOC165741 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC165741 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC165741, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC165741 BINDING SITE, designated SEQ ID:11611, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20128] Another function of GAM129 is therefore inhibition of LOC165741 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LOC165741.

[20129] LOC205418 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC205418 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC205418, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC205418 BINDING SITE, designated SEQ ID:9598, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20130] Another function of GAM129 is therefore inhibition of LOC205418 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205418.

[20131] LOC220739 (Accession XM_167548.3) is another GAM129 target gene, herein designated TARGET GENE. LOC220739 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220739, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:1430, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20132] Another function of GAM129 is therefore inhibition of LOC220739 (Accession XM_167548.3) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220739.

[20133] LOC221092 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC221092 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221092 BINDING SITE, designated SEQ ID:6809, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20134] Another function of GAM129 is therefore inhibition of LOC221092 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221092.

[20135] LOC222057 (Accession XM_166594.4) is another GAM129 target gene, herein designated TARGET GENE. LOC222057 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222057 BINDING SITE, designated SEQ ID:14251, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20136] Another function of GAM129 is therefore inhibition of LOC222057 (Accession XM_166594.4) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222057.

[20137] LOC222161 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC222161 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC222161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC222161 BINDING SITE, designated SEQ ID:10506, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20138] Another function of GAM129 is therefore inhibition of LOC222161 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222161.

[20139] LOC254263 (Accession XM_170654.3) is another GAM129 target gene, herein designated TARGET GENE. LOC254263 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254263, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254263 BINDING SITE, designated SEQ ID:12271, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20140] Another function of GAM129 is therefore inhibition of LOC254263 (Accession XM_170654.3) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254263.

[20141] LOC254753 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC254753 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254753, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254753 BINDING SITE, designated SEQ ID:13709, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20142] Another function of GAM129 is therefore inhibition of LOC254753 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254753.

[20143] LOC254944 (Accession XM_173170.1) is another GAM129 target gene, herein designated TARGET GENE. LOC254944 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254944, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254944 BINDING SITE, designated SEQ ID:16435, to

the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20144] Another function of GAM129 is therefore inhibition of LOC254944 (Accession XM_173170.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254944.

[20145] LOC51285 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC51285 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC51285, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51285 BINDING SITE, designated SEQ ID:3543, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20146] Another function of GAM129 is therefore inhibition of LOC51285 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51285.

[20147] LOC51667 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC51667 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51667, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51667 BINDING SITE, designated SEQ ID:13920, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20148] Another function of GAM129 is therefore inhibition of LOC51667 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51667.

[20149] LOC58525 (Accession) is another GAM129 target gene, herein designated TARGET GENE. LOC58525 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC58525, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC58525 BINDING SITE, designated SEQ ID:12229, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20150] Another function of GAM129 is therefore inhibition of

LOC58525 (Accession) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58525.

[20151] Mannosidase, alpha, class 1a, member 1 (MAN1A1, Accession NM_005907.2) is another GAM129 target gene, herein designated TARGET GENE. MAN1A1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MAN1A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAN1A1 BINDING SITE, designated SEQ ID:1824, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20152] Another function of GAM129 is therefore inhibition of Mannosidase, alpha, class 1a, member 1 (MAN1A1, Accession NM_005907.2), a gene which removes 3 distinct mannose residues from peptide- bound Man(9)- GlcNAc(2) oligosaccharides. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1A1.

[20153] The function of MAN1A1 has been established by previous studies. Man(9)- mannosidase (alpha- 1,2- mannosidase

1A) catalyzes the removal of 3 distinct mannose residues from peptide- bound Man(9)- GlcNAc(2) oligosaccharides. See MAN2A1 (OMIM Ref. No. 154582) for general information. Using an oligonucleotide probe derived from a pig liver Man(9)- mannosidase- specific cDNA template, Bause et al. (1993) isolated Man(9)- mannosidase from a human kidney cDNA library. The full- length cDNA predicted a 625- amino acid protein with a calculated molecular mass of 71 kD. Man(9)- mannosidase is a type II transmembrane protein with a short cytoplasmic polypeptide tail, a single transmembrane domain acting as a noncleavable signal sequence, a large luminal catalytic domain, and 3 potential N- glycosylation sites

[20154]

[20155] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20156] Bause, E.; Bieberich, E.; Rolfs, A.; Volker, C.; Schmidt, B. : Molecular cloning and primary structure of Man(9)- mannosidase from human kidney. Eur. J. Biochem. 217: 535-540, 1993. ; and

[20157] Tremblay, L. O; Campbell Dyke, N.; Herscovics, A. : Molecular cloning, chromosomal mapping and tissue- specific

expression of a novel human alpha- 1,2- mannosidase gene involved in N- glycan.

[20158] Further studies establishing the function and utilities of MAN1A1 are found in John Hopkins OMIM database record ID 604344, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC10471 (Accession NM_030818.1) is another GAM129 target gene, herein designated TARGET GENE. MGC10471 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC10471, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10471 BINDING SITE, designated SEQ ID:3302, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20159] Another function of GAM129 is therefore inhibition of MGC10471 (Accession NM_030818.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10471.

[20160] MGC16186 (Accession NM_032372.1) is another GAM129 target gene, herein designated TARGET GENE. MGC16186

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC16186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16186 BINDING SITE, designated SEQ ID:15910, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20161] Another function of GAM129 is therefore inhibition of MGC16186 (Accession NM_032372.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16186.

[20162] MGC4368 (Accession NM_024510.2) is another GAM129 target gene, herein designated TARGET GENE. MGC4368 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC4368, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4368 BINDING SITE, designated SEQ ID:2451, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20163] Another function of GAM129 is therefore inhibition of MGC4368 (Accession NM_024510.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4368.

[20164] MGC4796 (Accession XM_029031.7) is another GAM129 target gene, herein designated TARGET GENE. MGC4796 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MGC4796, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:3662, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20165] Another function of GAM129 is therefore inhibition of MGC4796 (Accession XM_029031.7) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796.

[20166] Matrix metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM_002428.1) is another GAM129 target gene, herein designated TARGET GENE. MMP15

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MMP15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MMP15 BINDING SITE, designated SEQ ID:15972, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20167] Another function of GAM129 is therefore inhibition of Matrix metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM_002428.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP15.

[20168] Neurexophilin 3 (NXPH3, Accession NM_007225.1) is another GAM129 target gene, herein designated TARGET GENE. NXPH3 BINDING SITE1 and NXPH3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NXPH3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE1 and NXPH3 BINDING SITE2, designated SEQ ID:2877 and SEQ ID:3126 respectively, to the nucleotide sequence of

GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20169] Another function of GAM129 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession NM_007225.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3.

[20170] Ovarian cancer overexpressed 1 (OVCOV1, Accession NM_173073.1) is another GAM129 target gene, herein designated TARGET GENE. OVCOV1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by OVCOV1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OVCOV1 BINDING SITE, designated SEQ ID:15335, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20171] Another function of GAM129 is therefore inhibition of Ovarian cancer overexpressed 1 (OVCOV1, Accession NM_173073.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OVCOV1.

[20172] Phosphatidylinositol-4-phosphate 5-kinase, type i, gamma (PIP5K1C, Accession XM_047620.3) is another GAM129 target gene, herein designated TARGET GENE. PIP5K1C BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PIP5K1C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K1C BINDING SITE, designated SEQ ID:16602, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20173] Another function of GAM129 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, type i, gamma (PIP5K1C, Accession XM_047620.3) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C.

[20174] Periaxin (PRX, Accession NM_020956.1) is another GAM129 target gene, herein designated TARGET GENE. PRX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRX, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:18306, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20175] Another function of GAM129 is therefore inhibition of Periaxin (PRX, Accession NM_020956.1), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon- glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin- associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition and therefore is associated with Dejerine- sottas neuropathy, autosomal recessive. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of Dejerine- sottas neuropathy, autosomal recessive, and of other diseases and clinical conditions associated with PRX.

[20176] The function of PRX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Protein tyrosine phosphatase, receptor type,

n polypeptide 2 (PTPRN2, Accession NM_130842.1) is another GAM129 target gene, herein designated TARGET GENE. PTPRN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPRN2 BINDING SITE, designated SEQ ID:17373, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20177] Another function of GAM129 is therefore inhibition of Protein tyrosine phosphatase, receptor type, n polypeptide 2 (PTPRN2, Accession NM_130842.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN2.

[20178] Phosphorylase, glycogen; brain (PYGB, Accession NM_002862.2) is another GAM129 target gene, herein designated TARGET GENE. PYGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PYGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PYGB BINDING SITE, designated SEQ ID:19382, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20179] Another function of GAM129 is therefore inhibition of Phosphorylase, glycogen; brain (PYGB, Accession NM_002862.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGB.

[20180] Rab30, member ras oncogene family (RAB30, Accession NM_014488.2) is another GAM129 target gene, herein designated TARGET GENE. RAB30 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB30, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB30 BINDING SITE, designated SEQ ID:4058, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20181] Another function of GAM129 is therefore inhibition of Rab30, member ras oncogene family (RAB30, Accession NM_014488.2), a gene which is a GTP- binding protein.

Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB30.

[20182] The function of RAB30 has been established by previous studies. Chen et al. (1996) isolated a cDNA encoding RAB30, a small GTP- binding protein of the RAB family, from a human melanocyte cDNA library and from melanoma cells. The deduced 203- amino acid RAB30 protein shares minimal homology with previously documented GTPases. Northern blot analysis detected RAB30 transcripts ranging from 1.7 to 11 kb in most tissues tested. By somatic cell hybrid analysis, Chen et al. (1996) mapped the RAB30 gene to chromosome 11. Scott (2001) localized the RAB30 gene to 11q12- q14 based on sequence similarity between the RAB30 sequence (GenBank U57092) and chromosome 11 clones (GenBank AP000893 and AP000905).

[20183]

[20184] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20185] Chen, D.; Guo, J.; Miki, T.; Tachibana, M.; Gahl, W. A. : Molecular cloning of two novel rab genes from human

melanocytes. Gene 174: 129- 134, 1996. ; and

[20186] Scott, A. F. : Personal Communication. Baltimore, Md., 2/26/2001.

[20187] Further studies establishing the function and utilities of RAB30 are found in John Hopkins OMIM database record ID 605693, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NM_014737.1) is another GAM129 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:13010, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20188] Another function of GAM129 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NM_014737.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[20189] Rna binding motif protein, y chromosome, family 1, member a1 (RBMY1A1, Accession NM_005058.1) is another GAM129 target gene, herein designated TARGET GENE. RBMY1A1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RBMY1A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBMY1A1 BINDING SITE, designated SEQ ID:5003, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20190] Another function of GAM129 is therefore inhibition of Rna binding motif protein, y chromosome, family 1, member a1 (RBMY1A1, Accession NM_005058.1), a gene which is needed to organize a concentration gradient of a dorsalizing morphogen (dm) and is essential in somatic tissues. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBMY1A1.

[20191] The function of RBMY1A1 has been established by previous studies. Delbridge et al. (1997) reviewed the literature on the RBM1 gene family. Expression of the human RBM1 gene family is confined to the spermatogonia and early

primary spermatocytes in the lining of the seminiferous tubules in adults, but expression of the RBM1 gene family has also been demonstrated in the testis of 2- year- old and prepubertal boys, indicating that the RBM1 gene family may have an additional role in germ cell development. RBM1 is present as multiple copies in all eutherian species examined, including primates, rabbit, pig, cattle, sheep, and mouse. The RBM1 genes encode RNA- binding proteins containing a single N- terminal RNA- binding motif and a C- terminal auxiliary domain with 4 repeated segments with a high proportion of glycine, serine, and arginine residues, typical of many RNA- binding proteins. Two other genes that map to the same small region of the long arm of the human Y chromosome and are often deleted in azoospermic men are DAZ (OMIM Ref. No. 400003) and TSPY (OMIM Ref. No. 480100). Venables et al. (2000) used a yeast 2- hybrid system to show that RBM, the RBMX gene product hnRNP G (OMIM Ref. No. 300119), and a novel testis- specific relative (termed hnRNP G- T) interact with Tra2- beta (OMIM Ref. No. 602719), an activator of pre- mRNA splicing that is ubiquitous but highly expressed in testis. RBM and Tra2- beta colocalize in 2 major domains in human spermatocyte nuclei. Incubation

with the protein interaction domain of RBM inhibited splicing in vitro of a specific pre- mRNA substrate containing an essential enhancer bound by Tra2- beta. The RNA- binding domain of RBM affected 5- prime splice site selection. The authors concluded that the hnRNP G family of proteins is involved in pre- mRNA splicing and hypothesized that RBM may be involved in Tra2- beta- dependent splicing in spermatocytes.

[20192]

[20193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20194] Delbridge, M. L.; Harry, J. L.; Toder, R.; Waugh O'Neill, R. J.; Ma, K.; Chandley, A. C.; Marshall Graves, J. A. : A human candidate spermatogenesis gene, RBM1, is conserved and amplified on the marsupial Y chromosome. Nature Genet. 15: 131- 136, 1997. ; and

[20195] Venables, J. P.; Elliott, D. J.; Makarova, O. V.; Makarov, E. M.; Cooke, H.J.; Eperon, I. C. : RBMY, a probable human spermatogenesis factor, and other hnRNP G proteins interact with Tra.

[20196] Further studies establishing the function and utilities of RBMY1A1 are found in John Hopkins OMIM database

record ID 400006, and in cited publications listed in Table 5, which are hereby incorporated by reference.Arginine-glutamic acid dipeptide (re) repeats (RERE, Accession NM_012102.2) is another GAM129 target gene, herein designated TARGET GENE. RERE BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RERE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:1394, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20197] Another function of GAM129 is therefore inhibition of Arginine-glutamic acid dipeptide (re) repeats (RERE, Accession NM_012102.2), a gene which binds DRPLA and locates in the nucleus and therefore may be associated with Dentatorubral- pallidoluysian atrophy. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of Dentatorubral- pallidoluysian atrophy, and of other diseases and clinical conditions associated with RERE.

[20198] The function of RERE and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.RFT1 (Accession NM_052859.1) is another GAM129 target gene, herein designated TARGET GENE. RFT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RFT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RFT1 BINDING SITE, designated SEQ ID:9266, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20199] Another function of GAM129 is therefore inhibition of RFT1 (Accession NM_052859.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFT1.

[20200] Regulator of g-protein signalling 19 interacting protein 1 (RGS19IP1, Accession NM_005716.1) is another GAM129 target gene, herein designated TARGET GENE. RGS19IP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGS19IP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of RGS19IP1 BINDING SITE, designated SEQ ID:2755, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20201] Another function of GAM129 is therefore inhibition of Regulator of g-protein signalling 19 interacting protein 1 (RGS19IP1, Accession NM_005716.1), a gene which is involved in g protein- linked signaling. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS19IP1.

[20202] The function of RGS19IP1 has been established by previous studies. Northern blot analysis detected a 1.8- kb C19ORF3 transcript in all tissues tested, with strongest expression in pancreas, followed by skeletal muscle, brain, kidney, placenta, lung, liver, and lowest expression in heart. Expression levels did not correlate with those of GAIP. Immunoblot analysis demonstrated the presence of C19ORF3 primarily in cytosolic fractions but also in membrane fractions. Immunofluorescence analysis showed expression of endogenous C19ORF3 in both a diffuse and a punctate staining pattern throughout the cytoplasm. Using a yeast 2- hybrid system, Bunn et al. (1999) isolated a

cDNA encoding C19ORF3, which they called GLUT1CBP (GLUT1 (SLC2A1; 138140) C- terminus- binding protein). SDS- PAGE and Western blot analyses determined that C19ORF3 is expressed as a 39- kD protein in all tissues tested except small intestine. Yeast 2- hybrid analysis showed that C19ORF3 binds SLC2A1 through its PDZ domain. Northern blot analysis revealed similar expression patterns for C19ORF3 and SLC2A1, with both being expressed most strongly in brain. Using a yeast 2- hybrid screen for brain- interacting proteins, the authors determined that only SLC2A1, KIF1B, and alpha actinin- 1 (ACTN1; 102575) bind C19ORF3 through its PDZ domain; myosin VI (MYO6; 600970) was shown to interact with C19ORF3 but not via the PDZ domain.

[20203]

[20204] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20205] Bunn, R. C.; Jensen, M. A.; Reed, B. C. : Protein interactions with the glucose transporter binding protein GLUT1CBP that provide a link between GLUT1 and the cytoskeleton. Molec. Biol. Cell 10: 819- 832, 1999. ; and

[20206] Von Kap- Herr, C.; Kandala, G.; Mann, S. S.; Hart, T. C.;

Pettenati, M. J.; Setaluri, V. : Assignment of PDZ domain-containing protein GIPC gene (C19orf3) to human chromosome band 19p13.1 b.

[20207] Further studies establishing the function and utilities of RGS19IP1 are found in John Hopkins OMIM database record ID 605072, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ras and rab interactor 3 (RIN3, Accession NM_024892.1) is another GAM129 target gene, herein designated TARGET GENE. RIN3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RIN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:17667, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20208] Another function of GAM129 is therefore inhibition of Ras and rab interactor 3 (RIN3, Accession NM_024892.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3.

[20209] Ring finger protein 20 (RNF20, Accession NM_019592.4)

is another GAM129 target gene, herein designated TARGET GENE. RNF20 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF20, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF20 BINDING SITE, designated SEQ ID:18452, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20210] Another function of GAM129 is therefore inhibition of Ring finger protein 20 (RNF20, Accession NM_019592.4) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF20.

[20211] RNTRE (Accession NM_014688.1) is another GAM129 target gene, herein designated TARGET GENE. RNTRE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNTRE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNTRE BINDING SITE, designated SEQ ID:12347, to the nucleotide

sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20212] Another function of GAM129 is therefore inhibition of RNTRE (Accession NM_014688.1), a gene which may be involved in cell proliferation. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNTRE.

[20213] The function of RNTRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.RPP14 (Accession NM_007042.1) is another GAM129 target gene, herein designated TARGET GENE. RPP14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPP14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPP14 BINDING SITE, designated SEQ ID:4118, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20214] Another function of GAM129 is therefore inhibition of RPP14 (Accession NM_007042.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with RPP14.

[20215] RRP22 (Accession NM_006477.1) is another GAM129 target gene, herein designated TARGET GENE. RRP22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RRP22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RRP22 BINDING SITE, designated SEQ ID:5851, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20216] Another function of GAM129 is therefore inhibition of RRP22 (Accession NM_006477.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRP22.

[20217] SELB (Accession NM_021937.1) is another GAM129 target gene, herein designated TARGET GENE. SELB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SELB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SELB BINDING SITE, designated SEQ ID:14956, to the nucleotide se-

quence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20218] Another function of GAM129 is therefore inhibition of SELB (Accession NM_021937.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELB.

[20219] Sema domain, immunoglobulin domain (ig), and gpi membrane anchor, (semaphorin) 7a (SEMA7A, Accession NM_003612.1) is another GAM129 target gene, herein designated TARGET GENE. SEMA7A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEMA7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEMA7A BINDING SITE, designated SEQ ID:13896, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20220] Another function of GAM129 is therefore inhibition of Sema domain, immunoglobulin domain (ig), and gpi membrane anchor, (semaphorin) 7a (SEMA7A, Accession NM_003612.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SEMA7A.

[20221] Small glutamine-rich tetratricopeptide repeat (tpr)-containing (SGT, Accession NM_003021.2) is another GAM129 target gene, herein designated TARGET GENE. SGT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SGT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SGT BINDING SITE, designated SEQ ID:2232, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20222] Another function of GAM129 is therefore inhibition of Small glutamine-rich tetratricopeptide repeat (tpr)-containing (SGT, Accession NM_003021.2) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGT.

[20223] Solute carrier family 12 (potassium/chloride transporters), member 4 (SLC12A4, Accession NM_005072.2) is another GAM129 target gene, herein designated TARGET GENE. SLC12A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC12A4,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC12A4 BINDING SITE, designated SEQ ID:8109, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20224] Another function of GAM129 is therefore inhibition of Solute carrier family 12 (potassium/chloride transporters), member 4 (SLC12A4, Accession NM_005072.2), a gene which is a potassium- chloride cotransporter. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A4.

[20225] The function of SLC12A4 has been established by previous studies. Potassium- chloride cotransporters mediate the coupled movement of potassium and chloride ions across the plasma membrane. Gillen et al. (1996) cloned human potassium- chloride cotransporter- 1 based on the identification of ESTs with moderate homology to NKCC1 (OMIM Ref. No. 600840). The full- length sequence was obtained from EST clones and by RT- PCR of HEK293 cell RNA. The 1,085- amino acid KCC1 protein is 24 to 25% identical to NKCC1 and SLC12A3 (OMIM Ref.

No. 600968) and shares 97% identity with rabbit KCC1. The overall structure of KCC1 is similar to that of other cation- chloride cotransporters, with 12 predicted transmembrane regions, a large extracellular loop with potential N- linked glycosylation sites, and cytoplasmic N- and C- terminal domains. Northern blot analysis revealed that KCC1 is expressed ubiquitously. Gillen et al. (1996) demonstrated that KCC1 exhibits the functional properties of the red cell K- Cl cotransporter, including stimulation by swelling and N- ethylmaleimide, and low affinities for rubidium, chloride, and bumetanide. Pellegrino et al. (1998) demonstrated that levels of erythroid- KCC1 mRNA are upregulated during early stages of erythroid differentiation and fall to very low levels in later stages. They found no full- length KCC1 transcripts in human or mouse circulating reticulocytes. They suggested that erythroid-KCC1 may play a role in early erythroid maturation events.

[20226]

[20227] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20228] Gillen, C. M.; Brill, S.; Payne, J. A.; Forbush, B., III : Molecular cloning and functional expression of the K- Cl co-

transporter from rabbit, rat, and human: a new member of the cation- chloride cotransporter family. J. Biol. Chem. 271: 16237- 16244, 1996. ; and

[20229] Pellegrino, C. M.; Rybicki, A. C.; Musto, S.; Nagel, R. L.; Schwartz, R. S. : Molecular identification and expression of erythroid K:Cl cotransporter in human and mouse erythroleukemic cell.

[20230] Further studies establishing the function and utilities of SLC12A4 are found in John Hopkins OMIM database record ID 604119, and in cited publications listed in Table 5, which are hereby incorporated by reference.Steroid-5-alpha-reductase, alpha polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM_001047.1) is another GAM129 target gene, herein designated TARGET GENE. SRD5A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRD5A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRD5A1 BINDING SITE, designated SEQ ID:11202, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20231] Another function of GAM129 is therefore inhibition of Steroid-5-alpha-reductase, alpha polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM_001047.1), a gene which catalyzes the conversion of testosterone into 5- alpha- dihydrotestosterone and progesterone . and therefore may be associated with Polycystic ovary syndrome (pcos). Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of Polycystic ovary syndrome (pcos), and of other diseases and clinical conditions associated with SRD5A1.

[20232] The function of SRD5A1 has been established by previous studies. Harris et al. (1992) concluded that SRD5A1 is a minor component of the reductase activity in prostate although the gene was originally cloned from prostate. On the other hand, SRD5A1 appears to be the predominant isozyme of steroid 5- alpha- reductase in the scalp and elsewhere in the skin. The possibility of scalp- selective inhibitors being useful in the treatment of male pattern baldness, acne, and hirsutism, all 'disorders' that appear to be dihydrotestosterone dependent, was raised. Jenkins et al. (1992) used RFLPs of the SRD5A1 gene to exclude the gene as the site of the mutation in classic 5- alpha-

reductase deficiency (pseudovaginal perineoscrotal hypospadias; 264600). They further showed that in contrast to the major steroid 5- alpha- reductase in the prostate and cultured skin fibroblasts, which was designated SRD5A2, the cDNA- encoded enzyme, representing SRD5A1, exhibited a neutral to basic pH optimum and was much less sensitive to inhibition by the 4- aza steroid finasteride.

[20233]

[20234] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20235] Harris, G.; Azzolina, B.; Baginsky, W.; Cimis, G.; Rasmusson, G. H.; Tolman, R. L.; Raetz, C. R. H.; Ellsworth, K. : Identification and selective inhibition of an isozyme of steroid 5- alpha- reductase in human scalp. Proc. Nat. Acad. Sci. 89: 10787- 10791, 1992. ; and

[20236] Jenkins, E. P.; Andersson, S.; Imperato- McGinley, J.; Wilson, J. D.; Russell, D. W. : Genetic and pharmacological evidence for more than one human steroid 5- alpha- reductase. J. Clin. Invest.

[20237] Further studies establishing the function and utilities of SRD5A1 are found in John Hopkins OMIM database record

ID 184753, and in cited publications listed in Table 5, which are hereby incorporated by reference.Suppressor of ty 6 homolog (s. cerevisiae) (SUPT6H, Accession NM_003170.2) is another GAM129 target gene, herein designated TARGET GENE. SUPT6H BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SUPT6H, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUPT6H BINDING SITE, designated SEQ ID:14488, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20238] Another function of GAM129 is therefore inhibition of Suppressor of ty 6 homolog (s. cerevisiae) (SUPT6H, Accession NM_003170.2), a gene which may normally act to repress transcription at a variety of loci, and also plays a role in chromatin structure or assembly. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUPT6H.

[20239] The function of SUPT6H has been established by previous studies. Chiang et al. (1996) isolated and sequenced

SUPT6H and Supt6h, the human and murine homologs of the Saccharomyces cerevisiae and Caenorhabditis elegans genes SPT6 and emb- 5, respectively. The human and murine SPT6 homologs are virtually identical, as they share more than 98% identity and more than 99% similarity at the protein level. The derived amino acid sequences of these 2 genes predicted a 1,603- amino acid polypeptide in human and a 1,726- amino acid polypeptide in mouse, respectively. The proteins have a highly acidic 5-prime region, a degenerate SH2 domain, and a leucine zipper, features consistent with a nuclear protein that regulates transcription. Northern blotting revealed a 7.0-kb transcript that was expressed constitutively in both mouse and human. Chiang et al. (1996) commented that SUPT6H appears to be functionally analogous to SPT6 and emb- 5 and may therefore regulate transcription through establishment or maintenance of chromatin structure. By PCR- based analysis of somatic cell hybrids and by fluorescence in situ hybridization, Chiang et al. (1996) mapped the human homolog to 17q11.2. Segre et al. (1995) detected a cDNA fragment from the Supt6h gene on a mouse YAC that also contained the 'nude' locus. Their data placed Supt6h approximately 100 kb from whn

(OMIM Ref. No. 600838), which is located on mouse chromosome 11. Thus, the Supt6h gene was mapped to mouse chromosome 11B1, which exhibits extensive homology of synteny with proximal human 17q.

[20240]

[20241] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20242] Chiang, P.- W.; Wang, S.; Smithivas, P.; Song, W.- J.; Ramamoorthy, S.; Hillman, J.; Puett, S.; Van Keuren, M. L.; Crombez, E.; Kumar, A.; Glover, T. W.; Miller, D. E.; Tsai, C.- H.; Blackburn, C. C.; Chen, X.- N.; Sun, Z.; Cheng, J.- F.; Korenberg, J. R.; Kurnit, D. M. : Identification and analysis of the human and murine putative chromatin structure regulator SUPT6H and Supt6h. Genomics 34: 328-333, 1996. ; and

[20243] Segre, J. A.; Nemhauser, J. L.; Taylor, B. A.; Nadeau, J. H.; Lander, E. S. : Positional cloning of the nude locus: genetic, physical and transcription maps of the region and mutations.

[20244] Further studies establishing the function and utilities of SUPT6H are found in John Hopkins OMIM database record ID 601333, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Tea domain family member 2 (TEAD2, Accession NM_003598.1) is another GAM129 target gene, herein designated TARGET GENE. TEAD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TEAD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TEAD2 BINDING SITE, designated SEQ ID:18248, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20245] Another function of GAM129 is therefore inhibition of Tea domain family member 2 (TEAD2, Accession NM_003598.1), a gene which is a putative transcription factor that may be involved in the gene regulation of neural development. Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEAD2.

[20246] The function of TEAD2 has been established by previous studies. Jacquemin et al. (1996) cloned the mouse and human homologs of TEF4, a member of the TEA/ATTS transcription factor family. They found that a partial TEF4

cDNA encodes a protein that is 67% identical to TEF1 (OMIM Ref. No. 189967). Additionally, they observed that TEF4 can cooperatively bind the GT- IIC and Sph(I+II) enhansons of the SV40 enhancer. Jacquemin et al. (1996) determined by RT- PCR that human TEF4 is strongly expressed in a human ovarian carcinoma cell line, and they determined by in situ hybridization that tef4 is differentially expressed during mouse embryonic development. By fluorescence in situ hybridization and radiation hybrid analysis, Jacquemin et al. (1999) mapped the TEAD2 gene to 19q13.3.

[20247]

[20248] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20249] Jacquemin, P.; Depetris, D.; Mattei, M.- G.; Martial, J. A.; Davidson, I. : Localization of human transcription factor TEF- 4 and TEF- 5 (TEAD2, TEAD3) genes to chromosomes 19q13.3 and 6p21.2 using fluorescence in situ hybridization and radiation hybrid analysis. Genomics 55: 127- 129, 1999. ; and

[20250] Jacquemin, P.; Hwang, J.- J.; Martial, J. A.; Dolle, P.; Davidson, I. : A novel family of developmentally regulated

mammalian transcription factors containing the TEA/ATTS DNA binding do.

[20251] Further studies establishing the function and utilities of TEAD2 are found in John Hopkins OMIM database record ID 601729, and in cited publications listed in Table 5, which are hereby incorporated by reference.Zinc finger, dhhc domain containing 7 (ZDHHC7, Accession NM_017740.1) is another GAM129 target gene, herein designated TARGET GENE. ZDHHC7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZDHHC7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZDHHC7 BINDING SITE, designated SEQ ID:3493, to the nucleotide sequence of GAM129 RNA, herein designated GAM RNA, also designated SEQ ID:213.

[20252] Another function of GAM129 is therefore inhibition of Zinc finger, dhhc domain containing 7 (ZDHHC7, Accession NM_017740.1) . Accordingly, utilities of GAM129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC7.

[20253]

[20254] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 130 (GAM130), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20255] GAM130 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM130 was detected is described hereinabove with reference to Figs. 8-15.

[20256] GAM130 gene, herein designated GAM GENE, and GAM130 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[20257] GAM130 gene encodes a GAM130 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM130 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM130 precursor RNA is designated SEQ ID:127, and is provided hereinbelow with reference to the sequence listing part.

[20258] GAM130 precursor RNA folds onto itself, forming GAM130 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20259] GAM130 precursor RNA folds onto itself, forming GAM130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[20260] Nucleotide sequence of GAM130 precursor RNA, designated SEQ-ID: 127, and a schematic representation of a predicted secondary folding of GAM130 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[20261] An enzyme complex designated DICER COMPLEX, `dices` the GAM130 folded precursor RNA into GAM130 RNA,

herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM130 RNA is designated SEQ ID:331, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[20262] GAM130 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM130 target RNA, herein designated GAM TARGET RNA. GAM130 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20263] GAM130 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM130 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM130 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM130 RNA may have a different number of target binding sites in untranslated regions of a GAM130 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20264] The complementary binding of GAM130 RNA, herein designated GAM RNA, to target binding sites on GAM130 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM130 target RNA into GAM130 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20265] It is appreciated that GAM130 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM130 target genes. The mRNA of each one of this plu-

rality of GAM130 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM130 RNA, herein designated GAM RNA, and which when bound by GAM130 RNA causes inhibition of translation of respective one or more GAM130 target proteins.

[20266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM130 gene, herein designated GAM GENE, on one or more GAM130 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20267] It is appreciated that specific functions and accordingly

utilities of GAM130 correlate with, and may be deduced from, the identity of the target genes which GAM130 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20268]

[20269]

[20270] Alpha-1-b glycoprotein (A1BG, Accession NP_570602.2) is a GAM130 target gene, herein designated TARGET GENE. A1BG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by A1BG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE, designated SEQ ID:6105, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20271] A function of GAM130 is therefore inhibition of Alpha-1-b glycoprotein (A1BG, Accession NP_570602.2), a gene which a plasma protein of unknown function. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A1BG.

[20272] The function of A1BG has been established by previous studies. The complete amino acid sequence of alpha- 1B- glycoprotein, a plasma protein of unknown function, was determined by Ishioka et al. (1986). Sequence homology to immunoglobulins was recognized. Alpha- 1B- glycoprotein is present in normal adult plasma at an average concentration of 22 mg/dl. Gahne et al. (1987) observed genetic polymorphism of A1B using one- dimensional horizontal polyacrylamide gel electrophoresis followed by Western blotting with specific antiserum. Three different phenotypes, designated 1- 1, 1- 2, and 2- 2, were observed. Family data supported the hypothesis that the three phenotypes are determined by 2 codominant alleles at an autosomal locus. In pigs the homologous locus is linked to malignant hyperthermia (OMIM Ref. No. 145600). Several other linkages in pigs and in horses suggest that human chromosomes 19, 6, and 1 are 'candidate chromosomes' for bearing the human A1B. Juneja et al. (1988) found a higher degree of A1B polymorphism in American blacks than in Caucasian populations. They described new alleles. Eiberg et al. (1989) reported exclusion data for localization of the alpha- 1B- glycoprotein gene polymorphism. Eiberg et al. (1989) found linkage between

A1BG and Lutheran blood group (OMIM Ref. No. 111150); lod = 3.06 at theta = 0.05 in males, and lod = 1.42 at theta = 0.10 in females. They suggested that the most likely order of genes on chromosome 19 is C3- - SE- - LU- - A1BG.

[20273]

[20274] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20275] Ishioka, N.; Takahashi, N.; Putnam, F. W. : Amino acid sequence of human plasma alpha- 1B- glycoprotein: homology to the immunoglobulin supergene family. Proc. Nat. Acad. Sci. 83: 2363- 2367, 1986. ; and

[20276] Eiberg, H.; Bisgaard, M. L.; Mohr, J. : Linkage between alpha- 1- B- glycoprotein (A1BG) and Lutheran (LU) red blood group system: assignment to chromosome 19: new genetic variants of A1BG.

[20277] Further studies establishing the function and utilities of A1BG are found in John Hopkins OMIM database record ID 138670, and in cited publications listed in Table 5, which are hereby incorporated by reference.AAK1 (Accession NP_055726.2) is another GAM130 target gene, herein designated TARGET GENE. AAK1 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by AAK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AAK1 BINDING SITE, designated SEQ ID:7111, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20278] Another function of GAM130 is therefore inhibition of AAK1 (Accession NP_055726.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAK1.

[20279] AD7C-NTP (Accession NP_055301.1) is another GAM130 target gene, herein designated TARGET GENE. AD7C-NTP BINDING SITE1 and AD7C-NTP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by AD7C-NTP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AD7C-NTP BINDING SITE1 and AD7C-NTP BINDING SITE2, designated SEQ ID:18860 and SEQ ID:9687 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20280] Another function of GAM130 is therefore inhibition of AD7C-NTP (Accession NP_055301.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD7C-NTP.

[20281] Apc11 anaphase promoting complex subunit 11 homolog (yeast) (ANAPC11, Accession NP_057560.8) is another GAM130 target gene, herein designated TARGET GENE. ANAPC11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ANAPC11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANAPC11 BINDING SITE, designated SEQ ID:10495, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20282] Another function of GAM130 is therefore inhibition of Apc11 anaphase promoting complex subunit 11 homolog (yeast) (ANAPC11, Accession NP_057560.8) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANAPC11.

[20283] Adaptor-related protein complex 1, mu 1 subunit (AP1M1, Accession NP_115882.1) is another GAM130 target gene, herein designated TARGET GENE. AP1M1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AP1M1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1M1 BINDING SITE, designated SEQ ID:4671, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20284] Another function of GAM130 is therefore inhibition of Adaptor-related protein complex 1, mu 1 subunit (AP1M1, Accession NP_115882.1), a gene which promotes the formation of clathrin- coated pits and vesicles. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1M1.

[20285] The function of AP1M1 has been established by previous studies. Heterotetrameric adaptor complexes promote the formation of clathrin- coated pits and vesicles. The AP- 1 adaptor, localized at the trans- Golgi network, is composed of 2 approximately 100- kD subunits, beta- prime

adaptin (OMIM Ref. No. 600157) and gamma- adaptin (OMIM Ref. No. 603533); a medium subunit, AP47; and a small subunit, AP19 (OMIM Ref. No. 603531). Nakayama et al. (1991) isolated a mouse brain cDNA encoding AP47. [20286]

[20287] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20288] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP- 1 in packaging MPRs at the trans- Golgi network. Science 297: 1700- 1703, 2002. ; and

[20289] Nakayama, Y.; Goebl, M.; O'Brine Greco, B.; Lemmon, S.; Pingchang Chow, E.; Kirchhausen, T. : The medium chains of the mammalian clathrin- associated proteins have a homolog in yeast. E.

[20290] Further studies establishing the function and utilities of AP1M1 are found in John Hopkins OMIM database record ID 603535, and in cited publications listed in Table 5, which are hereby incorporated by reference.APM1 (Accession NP_004788.1) is another GAM130 target gene, herein designated TARGET GENE. APM1 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by APM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:4972, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20291] Another function of GAM130 is therefore inhibition of APM1 (Accession NP_004788.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[20292] Apolipoprotein a-v (APOA5, Accession NP_443200.1) is another GAM130 target gene, herein designated TARGET GENE. APOA5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APOA5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOA5 BINDING SITE, designated SEQ ID:9130, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20293] Another function of GAM130 is therefore inhibition of Apolipoprotein a-v (APOA5, Accession NP_443200.1) .

Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOA5.

[20294] Amyloid beta precursor protein (cytoplasmic tail) binding protein 2 (APPBP2, Accession NP_006371.2) is another GAM130 target gene, herein designated TARGET GENE. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:6678, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20295] Another function of GAM130 is therefore inhibition of Amyloid beta precursor protein (cytoplasmic tail) binding protein 2 (APPBP2, Accession NP_006371.2), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore may be associated with Alzheimer's disease. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Alzheimer's disease, and of other diseases and clinical conditions associated with APPBP2.

[20296] The function of APPBP2 has been established by previous studies. Epithelial cell surfaces are divided into apical and basolateral domains. The basolateral sorting of cell surface proteins depends on the presence of peptide- based basolateral sorting signals (BaSS) in the cytoplasmic domains of proteins. Amyloid precursor protein (APP; 104760), a basolateral protein implicated in the pathogenesis of Alzheimer disease (AD; 104300), contains a tyrosine- based BaSS. Mutation of the tyrosine results in nonpolarized transport of APP. Using APP- BaSS as bait in a yeast 2- hybrid screen of a HeLa cell cDNA library, followed by negative selection with a tyr- ala mutant APP-BaSS as bait and 5- prime RACE, Zheng et al. (1998) isolated a cDNA encoding amyloid beta precursor protein-binding protein- 2 (OMIM Ref. No. APPBP2), which they called PAT1 (protein interacting with APP tail- 1). The deduced 585- amino acid hydrophilic APPBP2 protein, which is identical to the uncharacterized KIAA0228 protein identified by Nagase et al. (1996), lacks signal or transmembrane sequences but contains N- and C- terminal globular structures, a coiled coil domain, several protein kinase C phosphorylation sites, and 4 imperfect C- terminal tandem repeats. Binding analysis determined that APPBP2

binds specifically to the tyrosine- containing APP- BaSS and to to the complete cytoplasmic domain of APP; it does not bind to mutant APP- BaSS. Western blot analysis showed that APPBP2 is present as a 70- kD protein in both cytosolic and, together with APP, membrane- associated cell fractions. Immunofluorescence microscopy demonstrated that APPBP2 is present in the Golgi region and that its distribution overlaps that of APP. SDS- PAGE and immunoblotting showed that APPBP2 interacts with microtubules and is functionally associated with APP transport and/or processing. By Northern blot analysis, Nagase et al. (1996) detected ubiquitous expression of KIAA0228 as an approximately 6.5- kb transcript.

[20297]

[20298] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20299] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201- KIAA0280) deduced by analysis of cDNA clones from cell line KG- 1 and brain. DNA Res. 3:

321- 329, 1996. ; and

[20300] Zheng, P.; Eastman, J.; Vande Pol, S.; Pimplikar, S. W. : PAT1, a microtubule- interacting protein, recognizes the basolateral sorting signal of amyloid precursor protein. Proc. Nat. Aca.

[20301] Further studies establishing the function and utilities of APPBP2 are found in John Hopkins OMIM database record ID 605324, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ankyrin repeat and socs box-containing 9 (ASB9, Accession NP_076992.1) is another GAM130 target gene, herein designated TARGET GENE. ASB9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ASB9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB9 BINDING SITE, designated SEQ ID:6639, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20302] Another function of GAM130 is therefore inhibition of Ankyrin repeat and socs box-containing 9 (ASB9, Accession NP_076992.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with ASB9.

[20303] Atpase, na+/k+ transporting, beta 2 polypeptide (ATP1B2, Accession NP_001669.1) is another GAM130 target gene, herein designated TARGET GENE. ATP1B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:6894, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20304] Another function of GAM130 is therefore inhibition of Atpase, na+/k+ transporting, beta 2 polypeptide (ATP1B2, Accession NP_001669.1), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na +/K+ ions across the plasma membrane. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2.

[20305] The function of ATP1B2 has been established by previous studies. In the mouse, Malo et al. (1990) mapped the beta- 2 subunit of sodium- potassium- ATPase to chromosome 11 in a segment that is conserved on the peri-

centromeric region of human chromosome 17. Thus, Malo et al. (1990) speculated that the human ATP1B2 gene is on the proximal short arm or pericentric area of chromosome 17. By somatic cell hybrid analysis, Hsieh et al. (1990) demonstrated that the gene is indeed located on human chromosome 17 and confirmed the assignment to mouse chromosome 11, They referred to the gene as AMOG (adhesion molecule on glia). The adhesion molecule on glia is an integral membrane glycoprotein of MW 45- 50 K that is expressed by glial cells and mediates granule neuron migration along Bergmann glial cells in the developing cerebellum. The cDNA sequence of the mouse gene (Pagliusi et al., 1989) shows structural similarity to the beta subunit of Na,K- ATPase (ATP1B1; 182330). This enzyme consists of 2 subunits: a catalytic alpha subunit and a beta subunit of unknown function. Like ATP1B1, AMOG is molecularly associated with the alpha subunit and influences its catalytic activity. AMOG may be the same as what is referred to here as ATP1B2. Another beta- isoform gene expressed primarily in brain was isolated by Martin- Vasallo et al. (1989); its sequence is 97% identical to that for AMOG (Gloor et al., 1990). By study of recombinant inbred strains, Hsieh et al. (1990)

placed the Amog locus close to the genes for zinc finger protein- 3 (OMIM Ref. No. 194480) and the asialoglyco-protein receptor (108360, 108361) in a region of mouse chromosome 11 that is homologous to human 17p.

[20306]

[20307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20308] Gloor, S.; Antonicek, H.; Sweadner, K. J.; Pagliusi, S.; Frank, R.; Moos, M.; Schachner, M. : The adhesion molecule on glia (AMOG) is a homologue of the beta sub-unit of the Na,K- ATPase. J. Cell Biol. 110: 165- 174, 1990. ; and

[20309] Martin- Vasallo, P.; Dackowski, P.; Emanuel, J. R.; Leven-son, R. : Identification of a putative isoform of the Na,K-ATPase beta subunit: primary structure and tissue- spe-cific expression.

[20310] Further studies establishing the function and utilities of ATP1B2 are found in John Hopkins OMIM database record ID 182331, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atpase, (na+)/k+ transporting, beta 4 polypeptide (ATP1B4, Ac-cession NP_036201.1) is another GAM130 target gene,

herein designated TARGET GENE. ATP1B4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1B4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:16642, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20311] Another function of GAM130 is therefore inhibition of Atpase, (na+)/k+ transporting, beta 4 polypeptide (ATP1B4, Accession NP_036201.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4.

[20312] BA108L7.2 (Accession NP_112233.2) is another GAM130 target gene, herein designated TARGET GENE. BA108L7.2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BA108L7.2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:2887, to the nucleotide sequence of GAM130 RNA, herein designated

GAM RNA, also designated SEQ ID:331.

[20313] Another function of GAM130 is therefore inhibition of BA108L7.2 (Accession NP_112233.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2.

[20314] Bcl2-associated athanogene 5 (BAG5, Accession NP_004864.1) is another GAM130 target gene, herein designated TARGET GENE. BAG5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAG5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:770, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20315] Another function of GAM130 is therefore inhibition of Bcl2-associated athanogene 5 (BAG5, Accession NP_004864.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5.

[20316] B melanoma antigen (BAGE, Accession NP_001178.1) is another GAM130 target gene, herein designated TARGET

GENE. BAGE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAGE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAGE BINDING SITE, designated SEQ ID:15169, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20317] Another function of GAM130 is therefore inhibition of B melanoma antigen (BAGE, Accession NP_001178.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAGE.

[20318] BHD (Accession NP_659434.2) is another GAM130 target gene, herein designated TARGET GENE. BHD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BHD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BHD BINDING SITE, designated SEQ ID:19933, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20319] Another function of GAM130 is therefore inhibition of BHD (Accession NP_659434.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHD.

[20320] C14orf102 (Accession NP_060440.1) is another GAM130 target gene, herein designated TARGET GENE. C14orf102 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf102, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf102 BINDING SITE, designated SEQ ID:11571, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20321] Another function of GAM130 is therefore inhibition of C14orf102 (Accession NP_060440.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf102.

[20322] C14orf113 (Accession NP_060100.1) is another GAM130 target gene, herein designated TARGET GENE. C14orf113 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf113, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf113 BINDING SITE, designated SEQ ID:19332, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20323] Another function of GAM130 is therefore inhibition of C14orf113 (Accession NP_060100.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf113.

[20324] Chromosome 21 open reading frame 51 (C21orf51, Accession NP_478062.1) is another GAM130 target gene, herein designated TARGET GENE. C21orf51 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf51, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf51 BINDING SITE, designated SEQ ID:17801, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20325] Another function of GAM130 is therefore inhibition of

Chromosome 21 open reading frame 51 (C21orf51, Accession NP_478062.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf51.

[20326] C4orf9 (Accession XP_035572.1) is another GAM130 target gene, herein designated TARGET GENE. C4orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C4orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C4orf9 BINDING SITE, designated SEQ ID:6895, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20327] Another function of GAM130 is therefore inhibition of C4orf9 (Accession XP_035572.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4orf9.

[20328] Chromosome 9 open reading frame 9 (C9orf9, Accession NP_061829.2) is another GAM130 target gene, herein designated TARGET GENE. C9orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C9orf9, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:20130, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20329] Another function of GAM130 is therefore inhibition of Chromosome 9 open reading frame 9 (C9orf9, Accession NP_061829.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9.

[20330] Calcium modulating ligand (CAMLG, Accession NP_001736.1) is another GAM130 target gene, herein designated TARGET GENE. CAMLG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAMLG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMLG BINDING SITE, designated SEQ ID:16032, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20331] Another function of GAM130 is therefore inhibition of

Calcium modulating ligand (CAMLG, Accession NP_001736.1), a gene which is likely involved in the mobilization of calcium as a result of the tcr/cd3 complex interaction. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMLG.

[20332] The function of CAMLG has been established by previous studies. Calcium- modulating cyclophilin ligand was discovered by Bram and Crabtree (1994) in a 2- hybrid screen for signaling molecules that interact with cyclophilin B (OMIM Ref. No. 123841). It appears to be involved in the regulation of calcium signaling to T lymphocytes and other cells. The murine gene, symbolized Caml, was localized by interspecific backcross analysis of the middle of chromosome 13. By fluorescence in situ hybridization, Bram et al. (1996) localized the human CAMLG gene to chromosome 5q23, a region known to be syntenic to mouse chromosome 13.

[20333]

[20334] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20335] Bram, R. J.; Crabtree, G. R. : Calcium signalling in T cells

stimulated by a cyclophilin B- binding protein. Nature 371: 355- 358, 1994. ; and

[20336] Bram, R. J.; Valentine, V.; Shapiro, D. N.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G. : The gene for calcium-modulating cyclophilin ligand (CAMLG) is located on human chromosome 5.

[20337] Further studies establishing the function and utilities of CAMLG are found in John Hopkins OMIM database record ID 601118, and in cited publications listed in Table 5, which are hereby incorporated by reference.Caspase recruitment domain family, member 6 (CARD6, Accession NP_115976.2) is another GAM130 target gene, herein designated TARGET GENE. CARD6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CARD6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CARD6 BINDING SITE, designated SEQ ID:2870, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20338] Another function of GAM130 is therefore inhibition of Caspase recruitment domain family, member 6 (CARD6, Accession NP_115976.2) . Accordingly, utilities of

GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD6.

[20339] Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1) is another GAM130 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:3576, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20340] Another function of GAM130 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[20341] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM55.1.Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1) is another GAM130 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:3576, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20342] Another function of GAM130 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[20343] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM55.1.Chemokine (c-c motif) ligand 22 (CCL22, Accession NP_002981.2) is another GAM130 target gene, herein designated TARGET GENE. CCL22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCL22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL22 BINDING SITE, designated SEQ ID:18224, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20344] Another function of GAM130 is therefore inhibition of Chemokine (c-c motif) ligand 22 (CCL22, Accession NP_002981.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCL22.

[20345] Cyclin f (CCNF, Accession NP_001752.1) is another GAM130 target gene, herein designated TARGET GENE. CCNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

CCNF BINDING SITE, designated SEQ ID:3240, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20346] Another function of GAM130 is therefore inhibition of Cyclin f (CCNF, Accession NP_001752.1), a gene which likely to be involved in the control of the cell cycle during s phase and g2. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNF.

[20347] The function of CCNF has been established by previous studies. While searching in the 16p13.3 region for candidate genes for autosomal dominant polycystic kidney disease (PKD1; 173900), Kraus et al. (1994) identified a new member of the cyclin family. They characterized the transcript by sequencing, determination of exon/intron boundaries, and Northern blot analysis. Cyclin F is related to cyclins A (CCNA; 123835) and B (CCNB; 123836) by sequence, but its function is unknown. Cyclin F is the largest known human cyclin. Obermayr et al. (1995) mapped the gene to mouse chromosome 17 by analysis of hamster/mouse or human/mouse somatic cell hybrids containing Robertsonian translocations. For more accurate mapping, they used the BXD recombinant inbred strain system. Bai

et al. (1996) determined that SKP1 (OMIM Ref. No. 601434) binds to CCNF, SKP2 (OMIM Ref. No. 601436), and potentially to other regulatory proteins that may be involved in ubiquitin proteolysis. Binding occurs through a novel motif, termed the F box. The F box contains about 40 residues and, in approximately half of the F- box proteins identified by Bai et al. (1996), it was associated with leucine- rich regions (LRRs), as in SKP2, or with WD40 repeats, as in BTRC (OMIM Ref. No. 603482). The F- box only proteins, including CCNF, contain no other recognizable motifs.

[20348]

[20349] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20350] Kraus, B.; Pohlschmidt, M.; Leung, A. L. S.; Germino, G. G.; Snarey, A.; Schneider, M. C.; Reeders, S. T.; Frischauf, A.-M. : A novel cyclin gene (CCNF) in the region of the polycystic kidney disease gene (PKD1). Genomics 24: 27- 33, 1994. ; and

[20351] Bai, C.; Sen, P.; Hofmann, K.; Ma, L.; Goebl, M.; Harper, J. W.; Elledge, S. J. : SKP1 connects cell cycle regulators to the ubiquitin proteolysis machinery through a novel motif,

the F- .

[20352] Further studies establishing the function and utilities of CCNF are found in John Hopkins OMIM database record ID 600227, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd209 antigen (CD209, Accession NP_066978.1) is another GAM130 target gene, herein designated TARGET GENE. CD209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD209, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD209 BINDING SITE, designated SEQ ID:7192, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20353] Another function of GAM130 is therefore inhibition of Cd209 antigen (CD209, Accession NP_066978.1), a gene which may play an important role in the CD4- independent association of HIV with cells. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD209.

[20354] The function of CD209 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM96.1.Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_201589.1) is another GAM130 target gene, herein designated TARGET GENE. CDC14B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:2262, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20355] Another function of GAM130 is therefore inhibition of Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_201589.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B.

[20356] CDKAL1 (Accession NP_060244.1) is another GAM130 target gene, herein designated TARGET GENE. CDKAL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDKAL1, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDKAL1 BINDING SITE, designated SEQ ID:2168, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20357] Another function of GAM130 is therefore inhibition of CDKAL1 (Accession NP_060244.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKAL1.

[20358] Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_059120.2) is another GAM130 target gene, herein designated TARGET GENE. CECR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CECR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ ID:15627, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20359] Another function of GAM130 is therefore inhibition of Cat

eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_059120.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1.

[20360] Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_803124.1) is another GAM130 target gene, herein designated TARGET GENE. CECR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CECR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ ID:15627, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20361] Another function of GAM130 is therefore inhibition of Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_803124.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1.

[20362] Centromere protein h (CENPH, Accession NP_075060.1) is another GAM130 target gene, herein designated TARGET

GENE. CENPH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CENPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENPH BINDING SITE, designated SEQ ID:14626, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20363] Another function of GAM130 is therefore inhibition of Centromere protein h (CENPH, Accession NP_075060.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPH.

[20364] CGI-18 (Accession NP_057031.1) is another GAM130 target gene, herein designated TARGET GENE. CGI-18 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CGI-18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-18 BINDING SITE, designated SEQ ID:8151, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA,

also designated SEQ ID:331.

[20365] Another function of GAM130 is therefore inhibition of CGI-18 (Accession NP_057031.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-18.

[20366] C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2) is another GAM130 target gene, herein designated TARGET GENE. CLECSF12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLECSF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE, designated SEQ ID:16032, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20367] Another function of GAM130 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2), a gene which is a pattern- recognition receptor . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with CLECSF12.

[20368] The function of CLECSF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Cox15 homolog, cytochrome c oxidase assembly protein (yeast) (COX15, Accession NP_510870.1) is another GAM130 target gene, herein designated TARGET GENE. COX15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:2870, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20369] Another function of GAM130 is therefore inhibition of Cox15 homolog, cytochrome c oxidase assembly protein (yeast) (COX15, Accession NP_510870.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15.

[20370] Carboxypeptidase a4 (CPA4, Accession NP_057436.1) is

another GAM130 target gene, herein designated TARGET GENE. CPA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPA4 BINDING SITE, designated SEQ ID:14507, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20371] Another function of GAM130 is therefore inhibition of Carboxypeptidase a4 (CPA4, Accession NP_057436.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPA4.

[20372] Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XP_029311.2) is another GAM130 target gene, herein designated TARGET GENE. CPSF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE, designated SEQ ID:7534, to the nucleotide

sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20373] Another function of GAM130 is therefore inhibition of Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XP_029311.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2.

[20374] CYCS (Accession NP_061820.1) is another GAM130 target gene, herein designated TARGET GENE. CYCS BINDING SITE1 and CYCS BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CYCS, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYCS BINDING SITE1 and CYCS BINDING SITE2, designated SEQ ID:5106 and SEQ ID:18712 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20375] Another function of GAM130 is therefore inhibition of CYCS (Accession NP_061820.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYCS.

[20376] Debranching enzyme homolog 1 (s. cerevisiae) (DBR1, Ac-

cession NP_057300.1) is another GAM130 target gene, herein designated TARGET GENE. DBR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DBR1 BINDING SITE, designated SEQ ID:1786, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20377] Another function of GAM130 is therefore inhibition of Debranching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NP_057300.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBR1.

[20378] DCTN6 (Accession NP_006562.1) is another GAM130 target gene, herein designated TARGET GENE. DCTN6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCTN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCTN6 BINDING SITE, designated SEQ ID:807, to the nucleotide

sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20379] Another function of GAM130 is therefore inhibition of DCTN6 (Accession NP_006562.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN6.

[20380] Dead/h (asp-glu-ala-asp/his) box polypeptide 11 (chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_085913.1) is another GAM130 target gene, herein designated TARGET GENE. DDX11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DDX11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE, designated SEQ ID:14693, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20381] Another function of GAM130 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 11 (chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_085913.1), a gene which could be an ATP- dependent DNA- binding helicase and may intervene in cell

cycle regulation. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11.

[20382] The function of DDX11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Dna fragmentation factor, 40kda, beta polypeptide (caspase-activated dnase) (DFFB, Accession NP_004393.1) is another GAM130 target gene, herein designated TARGET GENE. DFFB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DFFB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:11120, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20383] Another function of GAM130 is therefore inhibition of Dna fragmentation factor, 40kda, beta polypeptide (caspase-activated dnase) (DFFB, Accession NP_004393.1), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accord-

ingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB.

[20384] The function of DFFB has been established by previous studies. Binding of the Fas ligand (FASL; 134638), also known as apoptosis antigen ligand- 1 (APT1LG1), a member of the tumor necrosis factor family, to its receptor Fas (OMIM Ref. No. 134637), also known as apoptosis antigen 1 (APT1), causes trimerization of the receptor. The trimerized receptor recruits caspase- 8 (CASP8; 601763), also known as apoptosis- related cysteine protease, through the adaptor molecule FADD (OMIM Ref. No. 602457), which stands for 'Fas- associating protein with death domain;' the trimerized receptor activates CASP8 at the plasma membrane by forming the death- inducing signaling complex. Activated CASP8 sequentially activates other members of the caspase family, such as CASP3 and CASP6 (OMIM Ref. No. 601532), which act downstream in the caspase cascade. The activated caspases then cleave various cellular substrates to cause the morphologic cellular changes observed during apoptosis. Mukae et al. (1998) cloned and characterized a DNase that can be activated by CASP3 and is involved in the degradation of chromosomal

DNA into nucleosomal units during apoptosis. The cDNA of human caspase- activated DNase (CAD) was found to be expressed in cells that easily undergo DNA fragmentation in response to apoptotic stimuli, but not in those that do not show apoptotic DNA fragmentation. Introduction of a CAD expression vector resulted in enhanced DNA fragmentation. By FISH, Mukae et al. (1998) localized the functional CAD gene to 1p36.3. The CAD mRNA was expressed in a limited number of human tissues, including pancreas, spleen, prostate, and ovary. By FISH, Judson et al. (2000) showed that DFFB lies distal to DFFA. They also mapped a processed DFFB pseudogene to chromosome 9. DFFB itself contains 7 coding exons spanning 10 kb. Exhaustive mutation screening of 41 neuroblastomas and other tumors in which a 1p36 tumor suppressor gene had been implicated showed no tumor- specific mutations. A coding region polymorphism was used to demonstrate uniformly biallelic expression in human fetal DFFB transcripts. Since the putative neuroblastoma tumor suppressor gene in distal 1p36 is predicted to be maternally expressed, the lack of imprinting and absence of somatic mutations in DFFB indicate that it probably is not the neuroblastoma tumor suppressor gene.

[20385]

[20386] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20387] Judson, H.; van Roy, N.; Strain, L.; Vandesompele, J.; Van Gele, M.; Speleman, F.; Bonthron, D. T. : Structure and mutation analysis of the gene encoding DNA fragmentation factor 40 (caspase- activated nuclease), a candidate neuroblastoma tumour suppressor gene. Hum. Genet. 106: 406- 413, 2000. ; and

[20388] Liu, X.; Zou, H.; Slaughter, C.; Wang, X. : DFF, a heterodimeric protein that functions downstream of caspase-3 to trigger DNA fragmentation during apoptosis. Cell 89: 175- 184, 1997.

[20389] Further studies establishing the function and utilities of DFFB are found in John Hopkins OMIM database record ID 601883, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dihydrofolate reductase (DHFR, Accession NP_000782.1) is another GAM130 target gene, herein designated TARGET GENE. DHFR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:18204, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20390] Another function of GAM130 is therefore inhibition of Dihydrofolate reductase (DHFR, Accession NP_000782.1), a gene which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHFR.

[20391] The function of DHFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM64.1.DKFZP564G092 (Accession NP_056416.1) is another GAM130 target gene, herein designated TARGET GENE. DKFZP564G092 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP564G092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:1337, to the nucleotide sequence of

GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20392] Another function of GAM130 is therefore inhibition of DKFZP564G092 (Accession NP_056416.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092.

[20393] DKFZp667B1218 (Accession NP_808881.1) is another GAM130 target gene, herein designated TARGET GENE. DKFZp667B1218 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp667B1218, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667B1218 BINDING SITE, designated SEQ ID:14527, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20394] Another function of GAM130 is therefore inhibition of DKFZp667B1218 (Accession NP_808881.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667B1218.

[20395] DKFZp761J139 (Accession NP_115656.1) is another GAM130 target gene, herein designated TARGET GENE. DKFZp761J139 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761J139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:6176, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20396] Another function of GAM130 is therefore inhibition of DKFZp761J139 (Accession NP_115656.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139.

[20397] DKFZp761O0113 (Accession NP_060879.1) is another GAM130 target gene, herein designated TARGET GENE. DKFZp761O0113 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761O0113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of DKFZp761O0113 BINDING SITE, designated SEQ ID:6894, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20398] Another function of GAM130 is therefore inhibition of DKFZp761O0113 (Accession NP_060879.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O0113.

[20399] DKFZp762I137 (Accession NP_689624.1) is another GAM130 target gene, herein designated TARGET GENE. DKFZp762I137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp762I137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp762I137 BINDING SITE, designated SEQ ID:2536, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20400] Another function of GAM130 is therefore inhibition of DKFZp762I137 (Accession NP_689624.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DKFZp762I137.

[20401] Down syndrome critical region gene 6 (DSCR6, Accession NP_061835.1) is another GAM130 target gene, herein designated TARGET GENE. DSCR6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:10753, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20402] Another function of GAM130 is therefore inhibition of Down syndrome critical region gene 6 (DSCR6, Accession NP_061835.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR6.

[20403] Dual specificity phosphatase 19 (DUSP19, Accession NP_543152.1) is another GAM130 target gene, herein designated TARGET GENE. DUSP19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DUSP19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of DUSP19 BINDING SITE, designated SEQ ID:11650, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20404] Another function of GAM130 is therefore inhibition of Dual specificity phosphatase 19 (DUSP19, Accession NP_543152.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP19.

[20405] Ecotropic viral integration site 5 (EVI5, Accession NP_005656.2) is another GAM130 target gene, herein designated TARGET GENE. EVI5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:1296, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20406] Another function of GAM130 is therefore inhibition of Ecotropic viral integration site 5 (EVI5, Accession NP_005656.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with EVI5.

[20407] Fanconi anemia, complementation group f (FANCF, Accession NP_073562.1) is another GAM130 target gene, herein designated TARGET GENE. FANCF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FANCF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:14481, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20408] Another function of GAM130 is therefore inhibition of Fanconi anemia, complementation group f (FANCF, Accession NP_073562.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF.

[20409] FLJ10713 (Accession NP_060659.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ10713 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10713, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:10891, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20410] Another function of GAM130 is therefore inhibition of FLJ10713 (Accession NP_060659.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713.

[20411] FLJ10902 (Accession NP_060736.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ10902 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10902, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10902 BINDING SITE, designated SEQ ID:13320, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20412] Another function of GAM130 is therefore inhibition of FLJ10902 (Accession NP_060736.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10902.

[20413] FLJ10922 (Accession NP_060743.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ10922 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:5661, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20414] Another function of GAM130 is therefore inhibition of FLJ10922 (Accession NP_060743.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922.

[20415] FLJ11235 (Accession NP_061906.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ11235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ11235 BINDING SITE, designated SEQ ID:3449, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20416] Another function of GAM130 is therefore inhibition of FLJ11235 (Accession NP_061906.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11235.

[20417] FLJ11323 (Accession NP_060860.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ11323 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ11323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11323 BINDING SITE, designated SEQ ID:4059, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20418] Another function of GAM130 is therefore inhibition of FLJ11323 (Accession NP_060860.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11323.

[20419] FLJ12586 (Accession NP_078896.2) is another GAM130 target gene, herein designated TARGET GENE. FLJ12586 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12586, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12586 BINDING SITE, designated SEQ ID:1864, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20420] Another function of GAM130 is therefore inhibition of FLJ12586 (Accession NP_078896.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12586.

[20421] FLJ12747 (Accession XP_290972.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ12747 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12747, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12747 BINDING SITE, designated SEQ ID:11006, to the

nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20422] Another function of GAM130 is therefore inhibition of FLJ12747 (Accession XP_290972.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12747.

[20423] FLJ12903 (Accession NP_073590.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ12903 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12903, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:6673, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20424] Another function of GAM130 is therefore inhibition of FLJ12903 (Accession NP_073590.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903.

[20425] FLJ12973 (Accession NP_079184.1) is another GAM130

target gene, herein designated TARGET GENE. FLJ12973 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12973 BINDING SITE, designated SEQ ID:2871, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20426] Another function of GAM130 is therefore inhibition of FLJ12973 (Accession NP_079184.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12973.

[20427] FLJ12975 (Accession NP_079085.2) is another GAM130 target gene, herein designated TARGET GENE. FLJ12975 BINDING SITE1 and FLJ12975 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ12975, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12975 BINDING SITE1 and FLJ12975 BINDING SITE2, designated SEQ ID:2871 and

SEQ ID:16538 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20428] Another function of GAM130 is therefore inhibition of FLJ12975 (Accession NP_079085.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12975.

[20429] FLJ13114 (Accession NP_078817.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ13114 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:9782, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20430] Another function of GAM130 is therefore inhibition of FLJ13114 (Accession NP_078817.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114.

[20431] FLJ14957 (Accession NP_116255.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ14957 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14957, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:11158, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20432] Another function of GAM130 is therefore inhibition of FLJ14957 (Accession NP_116255.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957.

[20433] FLJ20079 (Accession NP_060126.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ20079 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20079, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:10863, to the

nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20434] Another function of GAM130 is therefore inhibition of FLJ20079 (Accession NP_060126.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079.

[20435] FLJ20245 (Accession NP_060193.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ20245 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20245, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20245 BINDING SITE, designated SEQ ID:7716, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20436] Another function of GAM130 is therefore inhibition of FLJ20245 (Accession NP_060193.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20245.

[20437] FLJ23074 (Accession NP_079328.1) is another GAM130

target gene, herein designated TARGET GENE. FLJ23074 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ23074, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23074 BINDING SITE, designated SEQ ID:9888, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20438] Another function of GAM130 is therefore inhibition of FLJ23074 (Accession NP_079328.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23074.

[20439] FLJ23233 (Accession NP_078967.2) is another GAM130 target gene, herein designated TARGET GENE. FLJ23233 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23233, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23233 BINDING SITE, designated SEQ ID:14644, to the nucleotide sequence of GAM130 RNA, herein designated

GAM RNA, also designated SEQ ID:331.

[20440] Another function of GAM130 is therefore inhibition of FLJ23233 (Accession NP_078967.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23233.

[20441] FLJ23556 (Accession NP_079156.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ23556 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23556, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:9031, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20442] Another function of GAM130 is therefore inhibition of FLJ23556 (Accession NP_079156.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23556.

[20443] FLJ23563 (Accession XP_041701.4) is another GAM130 target gene, herein designated TARGET GENE. FLJ23563

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23563, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:7932, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20444] Another function of GAM130 is therefore inhibition of FLJ23563 (Accession XP_041701.4) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563.

[20445] FLJ30532 (Accession NP_653325.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ30532 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30532, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:6894, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20446] Another function of GAM130 is therefore inhibition of FLJ30532 (Accession NP_653325.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532.

[20447] FLJ31139 (Accession NP_775928.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ31139 BINDING SITE1 and FLJ31139 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ31139, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31139 BINDING SITE1 and FLJ31139 BINDING SITE2, designated SEQ ID:7990 and SEQ ID:19702 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20448] Another function of GAM130 is therefore inhibition of FLJ31139 (Accession NP_775928.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31139.

[20449] FLJ31166 (Accession NP_694567.1) is another GAM130

target gene, herein designated TARGET GENE. FLJ31166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31166 BINDING SITE, designated SEQ ID:11889, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20450] Another function of GAM130 is therefore inhibition of FLJ31166 (Accession NP_694567.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31166.

[20451] FLJ31338 (Accession NP_689682.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ31338 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31338, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31338 BINDING SITE, designated SEQ ID:5852, to the nucleotide sequence of GAM130 RNA, herein designated

GAM RNA, also designated SEQ ID:331.

[20452] Another function of GAM130 is therefore inhibition of FLJ31338 (Accession NP_689682.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31338.

[20453] FLJ31393 (Accession NP_694569.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ31393 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31393, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31393 BINDING SITE, designated SEQ ID:18530, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20454] Another function of GAM130 is therefore inhibition of FLJ31393 (Accession NP_694569.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31393.

[20455] FLJ32096 (Accession NP_776156.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ32096

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32096, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32096 BINDING SITE, designated SEQ ID:2283, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20456] Another function of GAM130 is therefore inhibition of FLJ32096 (Accession NP_776156.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32096.

[20457] FLJ32130 (Accession NP_689671.2) is another GAM130 target gene, herein designated TARGET GENE. FLJ32130 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32130, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32130 BINDING SITE, designated SEQ ID:6894, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20458] Another function of GAM130 is therefore inhibition of FLJ32130 (Accession NP_689671.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32130.

[20459] FLJ32865 (Accession NP_653214.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ32865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:3876, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20460] Another function of GAM130 is therefore inhibition of FLJ32865 (Accession NP_653214.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865.

[20461] FLJ34503 (Accession NP_775944.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ34503 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by FLJ34503, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34503 BINDING SITE, designated SEQ ID:17842, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20462] Another function of GAM130 is therefore inhibition of FLJ34503 (Accession NP_775944.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34503.

[20463] FLJ34969 (Accession XP_114353.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ34969 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34969, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34969 BINDING SITE, designated SEQ ID:2871, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20464] Another function of GAM130 is therefore inhibition of

FLJ34969 (Accession XP_114353.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34969.

[20465] FLJ37543 (Accession NP_775938.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ37543 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37543, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37543 BINDING SITE, designated SEQ ID:4619, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20466] Another function of GAM130 is therefore inhibition of FLJ37543 (Accession NP_775938.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37543.

[20467] FLJ38944 (Accession NP_689574.1) is another GAM130 target gene, herein designated TARGET GENE. FLJ38944 BINDING SITE1 and FLJ38944 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by FLJ38944, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38944 BINDING SITE1 and FLJ38944 BINDING SITE2, designated SEQ ID:2995 and SEQ ID:16294 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20468] Another function of GAM130 is therefore inhibition of FLJ38944 (Accession NP_689574.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38944.

[20469] GPP34R (Accession NP_060648.2) is another GAM130 target gene, herein designated TARGET GENE. GPP34R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPP34R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPP34R BINDING SITE, designated SEQ ID:8899, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20470] Another function of GAM130 is therefore inhibition of GPP34R (Accession NP_060648.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPP34R.

[20471] G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) is another GAM130 target gene, herein designated TARGET GENE. GPR26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR26 BINDING SITE, designated SEQ ID:2669, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20472] Another function of GAM130 is therefore inhibition of G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR26.

[20473] G1 to s phase transition 2 (GSPT2, Accession NP_060564.1) is another GAM130 target gene, herein designated TARGET GENE. GSPT2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA

encoded by GSPT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSPT2 BINDING SITE, designated SEQ ID:18829, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20474] Another function of GAM130 is therefore inhibition of G1 to s phase transition 2 (GSPT2, Accession NP_060564.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSPT2.

[20475] HATH6 (Accession NP_116216.1) is another GAM130 target gene, herein designated TARGET GENE. HATH6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HATH6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HATH6 BINDING SITE, designated SEQ ID:15485, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20476] Another function of GAM130 is therefore inhibition of

HATH6 (Accession NP_116216.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HATH6.

[20477] Interleukin 12 receptor, beta 1 (IL12RB1, Accession NP_714912.1) is another GAM130 target gene, herein designated TARGET GENE. IL12RB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL12RB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL12RB1 BINDING SITE, designated SEQ ID:1878, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20478] Another function of GAM130 is therefore inhibition of Interleukin 12 receptor, beta 1 (IL12RB1, Accession NP_714912.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL12RB1.

[20479] Interleukin 19 (IL19, Accession NP_037503.2) is another GAM130 target gene, herein designated TARGET GENE. IL19 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA en-

coded by IL19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL19 BINDING SITE, designated SEQ ID:8423, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20480] Another function of GAM130 is therefore inhibition of Interleukin 19 (IL19, Accession NP_037503.2), a gene which may play a role in B- cell activation and autoantibody production. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL19.

[20481] The function of IL19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Interleukin 1 receptor accessory protein-like 2 (IL1RAPL2, Accession NP_059112.1) is another GAM130 target gene, herein designated TARGET GENE. IL1RAPL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL1RAPL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

IL1RAPL2 BINDING SITE, designated SEQ ID:17936, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20482] Another function of GAM130 is therefore inhibition of Interleukin 1 receptor accessory protein-like 2 (IL1RAPL2, Accession NP_059112.1), a gene which may act in the development or function of the central nervous system. and therefore may be associated with Nonspecific mental retardation. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Nonspecific mental retardation, and of other diseases and clinical conditions associated with IL1RAPL2.

[20483] The function of IL1RAPL2 has been established by previous studies. The IL1 receptor family is composed of bona fide receptors (e.g., IL1R (OMIM Ref. No. 147810) and IL18R (OMIM Ref. No. 604494)), decoy receptors (e.g., IL1R2; 147811), signaling accessory receptors (e.g., IL1RAP (OMIM Ref. No. 602626) and IL18RAP (OMIM Ref. No. 604509)), and structurally homologous orphan receptors. During searches of genomic databases with the IL1RAPL1 (OMIM Ref. No. 300206) cDNA sequence, Jin et al. (2000) identified a close homolog, which they designated IL1RAPL2, located on Xq22. They obtained a partial

IL1RAPL2 cDNA by screening a human brain cDNA library. The cDNA encodes a deduced 658- amino acid protein that shares 65% identity with the IL1RAPL1 protein. Both proteins have novel C- terminal sequences not present in other members of the IL1 receptor family. The IL1RAPL2 gene is transcribed in a centromere- to- telomere direction. By searching genomic databases for sequences homologous to the Toll homology domain (THD), Sana et al. (2000) identified a cDNA encoding IL1RAPL2, which they termed IL1R9. Sequence analysis predicted that the 307- amino acid cytoplasmic tail of the 686- amino acid IL1RAPL2 protein contains an additional 120 to 130 residues beyond the THD, like IL1R8 (IL1RAPL1) but unlike other IL1Rs. Northern blot analysis revealed expression of a 5.5- kb transcript in fetal brain. Functional analysis determined that neither IL1RAPL1 nor IL1RAPL2 activate nuclear factor kappa- B (NFKB; OMIM Ref. No. 164011) except in the presence of bona fide receptors but not orphan receptors. Evolutionary sequence analysis suggested that these orphan receptors probably form a functionally distinct subset of the IL1R superfamily. Jin et al. (2000) and Sana et al. (2000) suggested that, like IL1RAPL1, IL1RAPL2 may be the site of mutations causing nonspe-

cific mental retardation.

[20484]

[20485] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20486] Jin, H.; Gardner, R. J.; Viswesvaraiah, R.; Muntoni, F.; Roberts, R. G. : Two novel members of the interleukin- 1 receptor gene family, one deleted in Xp22.1- Xp21.3 mental retardation. Europ. J. Hum. Genet. 8: 87- 94, 2000. ; and

[20487] Sana, T. R.; Debets, R.; Timans, J. C.; Bazan, J. F.; Kastelein, R. A. : Computational identification, cloning, and characterization of IL1R9, a novel interleukin- 1 receptor- like gene e.

[20488] Further studies establishing the function and utilities of IL1RAPL2 are found in John Hopkins OMIM database record ID 300277, and in cited publications listed in Table 5, which are hereby incorporated by reference.Indolethylamine n-methyltransferase (INMT, Accession NP_006765.3) is another GAM130 target gene, herein designated TARGET GENE. INMT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INMT, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INMT BINDING SITE, designated SEQ ID:2284, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20489] Another function of GAM130 is therefore inhibition of Indolethylamine n-methyltransferase (INMT, Accession NP_006765.3) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INMT.

[20490] KIAA0063 (Accession NP_055691.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA0063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:11890, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20491] Another function of GAM130 is therefore inhibition of KIAA0063 (Accession NP_055691.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0063.

[20492] KIAA0117 (Accession XP_290939.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA0117 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0117 BINDING SITE, designated SEQ ID:10770, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20493] Another function of GAM130 is therefore inhibition of KIAA0117 (Accession XP_290939.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0117.

[20494] KIAA0513 (Accession NP_055547.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA0513 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:6082, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20495] Another function of GAM130 is therefore inhibition of KIAA0513 (Accession NP_055547.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513.

[20496] KIAA0527 (Accession XP_171054.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA0527 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0527, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:10779, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20497] Another function of GAM130 is therefore inhibition of KIAA0527 (Accession XP_171054.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0527.

[20498] KIAA0563 (Accession NP_055649.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA0563 BINDING SITE1 and KIAA0563 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0563, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE1 and KIAA0563 BINDING SITE2, designated SEQ ID:6206 and SEQ ID:3624 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20499] Another function of GAM130 is therefore inhibition of KIAA0563 (Accession NP_055649.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563.

[20500] KIAA0962 (Accession XP_290942.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA0962 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0962, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0962 BINDING SITE, designated SEQ ID:2870, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20501] Another function of GAM130 is therefore inhibition of KIAA0962 (Accession XP_290942.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0962.

[20502] KIAA1002 (Accession XP_290584.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA1002 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1002 BINDING SITE, designated SEQ ID:1603, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20503] Another function of GAM130 is therefore inhibition of KIAA1002 (Accession XP_290584.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1002.

[20504] KIAA1054 (Accession XP_043493.5) is another GAM130 target gene, herein designated TARGET GENE. KIAA1054 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1054, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:5630, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20505] Another function of GAM130 is therefore inhibition of KIAA1054 (Accession XP_043493.5) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054.

[20506] KIAA1170 (Accession XP_045907.2) is another GAM130 target gene, herein designated TARGET GENE. KIAA1170 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:9008, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20507] Another function of GAM130 is therefore inhibition of KIAA1170 (Accession XP_045907.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170.

[20508] KIAA1203 (Accession XP_049683.4) is another GAM130 target gene, herein designated TARGET GENE. KIAA1203 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1203, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:14482, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20509] Another function of GAM130 is therefore inhibition of KIAA1203 (Accession XP_049683.4) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1203.

[20510] KIAA1257 (Accession XP_031577.2) is another GAM130 target gene, herein designated TARGET GENE. KIAA1257 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:6895, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20511] Another function of GAM130 is therefore inhibition of KIAA1257 (Accession XP_031577.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257.

[20512] KIAA1268 (Accession XP_291055.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA1268 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1268 BINDING SITE, designated SEQ ID:14527, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20513] Another function of GAM130 is therefore inhibition of KIAA1268 (Accession XP_291055.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1268.

[20514] KIAA1615 (Accession NP_066002.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA1615 BINDING SITE1 and KIAA1615 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1615, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE1 and KIAA1615 BINDING SITE2, designated SEQ ID:19161 and SEQ ID:19857 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20515] Another function of GAM130 is therefore inhibition of KIAA1615 (Accession NP_066002.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1615.

[20516] KIAA1712 (Accession XP_041497.2) is another GAM130 target gene, herein designated TARGET GENE. KIAA1712 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA1712, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:16424, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20517] Another function of GAM130 is therefore inhibition of KIAA1712 (Accession XP_041497.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712.

[20518] KIAA1712 (Accession NP_085136.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA1712 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA1712, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:16424, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20519] Another function of GAM130 is therefore inhibition of KIAA1712 (Accession NP_085136.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712.

[20520] KIAA1737 (Accession NP_219494.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA1737 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:6894, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20521] Another function of GAM130 is therefore inhibition of KIAA1737 (Accession NP_219494.1) . Accordingly, utilities

of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737.

[20522] KIAA1922 (Accession XP_057040.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA1922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:6286, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20523] Another function of GAM130 is therefore inhibition of KIAA1922 (Accession XP_057040.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922.

[20524] KIAA1987 (Accession XP_113870.1) is another GAM130 target gene, herein designated TARGET GENE. KIAA1987 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1987, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:14709, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20525] Another function of GAM130 is therefore inhibition of KIAA1987 (Accession XP_113870.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987.

[20526] Lysosomal-associated membrane protein 3 (LAMP3, Accession NP_055213.1) is another GAM130 target gene, herein designated TARGET GENE. LAMP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAMP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAMP3 BINDING SITE, designated SEQ ID:3877, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20527] Another function of GAM130 is therefore inhibition of Lysosomal-associated membrane protein 3 (LAMP3, Ac-

cession NP_055213.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP3.

[20528] LNK (Accession NP_005466.1) is another GAM130 target gene, herein designated TARGET GENE. LNK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LNK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:8277, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20529] Another function of GAM130 is therefore inhibition of LNK (Accession NP_005466.1), a gene which links T- cell receptor activation signal to phospholipase c- gamma- 1, grb- 2 and phosphatidylinositol 3- kinase (by similarity). Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK.

[20530] The function of LNK has been established by previous studies. .By PCR using primers based on the rat Lnk sequence and by screening a Jurkat cDNA library, Li et al.

(2000) obtained a cDNA encoding human LNK. Sequence analysis predicted that the 575- amino acid LNK protein contains an N- terminal proline- rich region, a pleckstrin homology (PH) domain, and an Src homology 2 (SH2) domain; the PH and SH2 domains are similar to those of the APS protein. Northern blot analysis detected low expression of a 6.8- kb LNK transcript in various lymphoid cell lines. Confocal fluorescence microscopy showed that the majority of LNK is located in the juxtanuclear region with some found near the plasma membrane. Immunoprecipitation analysis demonstrated that LNK is phosphorylated by LCK (OMIM Ref. No. 153390) but not by SYK (OMIM Ref. No. 600085) and that LNK binds to the tyrosine- phosphorylated TCR zeta chain via its SH2 domain. Functional analysis indicated that LNK inhibits the activation of NFAT (see OMIM Ref. No. 600489) in stimulated T cells

[20531] Animal model experiments lend further support to the function of LNK. Takaki et al. (2000) generated Lnk- deficient mice and found that although they had unimpaired T- cell development in thymus, pre- B and immature B cells accumulated in enlarged spleens. In bone marrow, there was also an increase in B- lineage cells, reflecting enhanced production of B- cell progenitors due in part to

hypersensitivity to SCF (KITLG; 184745) in the presence or absence of IL7 (OMIM Ref. No. 146660). Western blot analysis showed that mouse Lnk is actually a 68- kD protein

[20532] It is appreciated that the abovementioned animal model for LNK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[20533] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20534] Li, Y.; He, X.; Schembri- King, J.; Jakes, S.; Hayashi, J. : Cloning and characterization of human Lnk, an adaptor protein with pleckstrin homology and Src homology 2 domains that can inhibit T cell activation. J. Immun. 164: 5199- 5206, 2000. ; and

[20535] Takaki, S.; Sauer, K.; Iritani, B. M.; Chien, S.; Ebihara, Y.; Tsuji, K.; Takatsu, K.; Perlmutter, R. M. : Control of B cell production by the adaptor protein Lnk: definition of a conserve.

[20536] Further studies establishing the function and utilities of LNK are found in John Hopkins OMIM database record ID 605093, and in cited publications listed in Table 5, which

are hereby incorporated by reference.LOC119392 (Accession NP_660290.1) is another GAM130 target gene, herein designated TARGET GENE. LOC119392 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC119392, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC119392 BINDING SITE, designated SEQ ID:11220, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20537] Another function of GAM130 is therefore inhibition of LOC119392 (Accession NP_660290.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119392.

[20538] LOC128387 (Accession XP_059243.2) is another GAM130 target gene, herein designated TARGET GENE. LOC128387 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC128387, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC128387 BINDING SITE, designated SEQ ID:13503, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20539] Another function of GAM130 is therefore inhibition of LOC128387 (Accession XP_059243.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128387.

[20540] LOC135818 (Accession XP_059804.4) is another GAM130 target gene, herein designated TARGET GENE. LOC135818 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135818, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135818 BINDING SITE, designated SEQ ID:9805, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20541] Another function of GAM130 is therefore inhibition of LOC135818 (Accession XP_059804.4) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818.

[20542] LOC137886 (Accession XP_059929.3) is another GAM130 target gene, herein designated TARGET GENE. LOC137886 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC137886, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC137886 BINDING SITE, designated SEQ ID:16853, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20543] Another function of GAM130 is therefore inhibition of LOC137886 (Accession XP_059929.3) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137886.

[20544] LOC143241 (Accession NP_620167.1) is another GAM130 target gene, herein designated TARGET GENE. LOC143241 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143241, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143241 BINDING SITE, designated SEQ ID:4120, to

the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20545] Another function of GAM130 is therefore inhibition of LOC143241 (Accession NP_620167.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143241.

[20546] LOC145053 (Accession XP_096714.1) is another GAM130 target gene, herein designated TARGET GENE. LOC145053 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145053, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145053 BINDING SITE, designated SEQ ID:6594, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20547] Another function of GAM130 is therefore inhibition of LOC145053 (Accession XP_096714.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145053.

[20548] LOC146177 (Accession NP_778229.1) is another GAM130

target gene, herein designated TARGET GENE. LOC146177 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146177 BINDING SITE, designated SEQ ID:2870, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20549] Another function of GAM130 is therefore inhibition of LOC146177 (Accession NP_778229.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146177.

[20550] LOC146229 (Accession XP_085387.1) is another GAM130 target gene, herein designated TARGET GENE. LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC146229, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2, designated SEQ ID:8717

and SEQ ID:3994 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20551] Another function of GAM130 is therefore inhibition of LOC146229 (Accession XP_085387.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229.

[20552] LOC146784 (Accession XP_085588.1) is another GAM130 target gene, herein designated TARGET GENE. LOC146784 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146784 BINDING SITE, designated SEQ ID:14527, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20553] Another function of GAM130 is therefore inhibition of LOC146784 (Accession XP_085588.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784.

[20554] LOC147071 (Accession XP_054031.5) is another GAM130 target gene, herein designated TARGET GENE. LOC147071 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:6206, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20555] Another function of GAM130 is therefore inhibition of LOC147071 (Accession XP_054031.5) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071.

[20556] LOC147841 (Accession XP_085924.2) is another GAM130 target gene, herein designated TARGET GENE. LOC147841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147841 BINDING SITE, designated SEQ ID:739, to

the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20557] Another function of GAM130 is therefore inhibition of LOC147841 (Accession XP_085924.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147841.

[20558] LOC148137 (Accession NP_653293.1) is another GAM130 target gene, herein designated TARGET GENE. LOC148137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:2081, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20559] Another function of GAM130 is therefore inhibition of LOC148137 (Accession NP_653293.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137.

[20560] LOC148203 (Accession XP_086095.1) is another GAM130

target gene, herein designated TARGET GENE. LOC148203 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148203, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148203 BINDING SITE, designated SEQ ID:10581, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20561] Another function of GAM130 is therefore inhibition of LOC148203 (Accession XP_086095.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148203.

[20562] LOC148709 (Accession XP_086281.1) is another GAM130 target gene, herein designated TARGET GENE. LOC148709 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148709, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:13543, to the nucleotide sequence of GAM130 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:331.

[20563] Another function of GAM130 is therefore inhibition of LOC148709 (Accession XP_086281.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709.

[20564] LOC149149 (Accession XP_097598.1) is another GAM130 target gene, herein designated TARGET GENE. LOC149149 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149149 BINDING SITE, designated SEQ ID:18540, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20565] Another function of GAM130 is therefore inhibition of LOC149149 (Accession XP_097598.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149149.

[20566] LOC149506 (Accession XP_097661.1) is another GAM130 target gene, herein designated TARGET GENE. LOC149506

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:7438, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20567] Another function of GAM130 is therefore inhibition of LOC149506 (Accession XP_097661.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506.

[20568] LOC150587 (Accession XP_097917.1) is another GAM130 target gene, herein designated TARGET GENE. LOC150587 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150587, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150587 BINDING SITE, designated SEQ ID:14454, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20569] Another function of GAM130 is therefore inhibition of LOC150587 (Accession XP_097917.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150587.

[20570] LOC152687 (Accession XP_087503.1) is another GAM130 target gene, herein designated TARGET GENE. LOC152687 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152687, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152687 BINDING SITE, designated SEQ ID:17776, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20571] Another function of GAM130 is therefore inhibition of LOC152687 (Accession XP_087503.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152687.

[20572] LOC153346 (Accession XP_098364.1) is another GAM130 target gene, herein designated TARGET GENE. LOC153346 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC153346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153346 BINDING SITE, designated SEQ ID:1484, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20573] Another function of GAM130 is therefore inhibition of LOC153346 (Accession XP_098364.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153346.

[20574] LOC153811 (Accession XP_087779.2) is another GAM130 target gene, herein designated TARGET GENE. LOC153811 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153811, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:4924, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20575] Another function of GAM130 is therefore inhibition of

LOC153811 (Accession XP_087779.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153811.

[20576] LOC157623 (Accession XP_088346.6) is another GAM130 target gene, herein designated TARGET GENE. LOC157623 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157623, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157623 BINDING SITE, designated SEQ ID:18434, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20577] Another function of GAM130 is therefore inhibition of LOC157623 (Accession XP_088346.6) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157623.

[20578] LOC157918 (Accession XP_098842.1) is another GAM130 target gene, herein designated TARGET GENE. LOC157918 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157918, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:1338, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20579] Another function of GAM130 is therefore inhibition of LOC157918 (Accession XP_098842.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918.

[20580] LOC162427 (Accession NP_835227.1) is another GAM130 target gene, herein designated TARGET GENE. LOC162427 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC162427, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162427 BINDING SITE, designated SEQ ID:14028, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20581] Another function of GAM130 is therefore inhibition of

LOC162427 (Accession NP_835227.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162427.

[20582] LOC162427 (Accession XP_091549.3) is another GAM130 target gene, herein designated TARGET GENE. LOC162427 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC162427, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162427 BINDING SITE, designated SEQ ID:14028, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20583] Another function of GAM130 is therefore inhibition of LOC162427 (Accession XP_091549.3) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162427.

[20584] LOC163227 (Accession NP_775802.1) is another GAM130 target gene, herein designated TARGET GENE. LOC163227 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC163227, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC163227 BINDING SITE, designated SEQ ID:799, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20585] Another function of GAM130 is therefore inhibition of LOC163227 (Accession NP_775802.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163227.

[20586] LOC164091 (Accession XP_089356.1) is another GAM130 target gene, herein designated TARGET GENE. LOC164091 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC164091, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC164091 BINDING SITE, designated SEQ ID:20153, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20587] Another function of GAM130 is therefore inhibition of

LOC164091 (Accession XP_089356.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164091.

[20588] LOC169611 (Accession XP_095809.4) is another GAM130 target gene, herein designated TARGET GENE. LOC169611 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC169611, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:13298, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20589] Another function of GAM130 is therefore inhibition of LOC169611 (Accession XP_095809.4) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169611.

[20590] LOC197358 (Accession XP_113872.2) is another GAM130 target gene, herein designated TARGET GENE. LOC197358 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197358, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:15866, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20591] Another function of GAM130 is therefore inhibition of LOC197358 (Accession XP_113872.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358.

[20592] LOC200860 (Accession XP_117289.1) is another GAM130 target gene, herein designated TARGET GENE. LOC200860 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200860, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:8785, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20593] Another function of GAM130 is therefore inhibition of LOC200860 (Accession XP_117289.1) . Accordingly, utili-

ties of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860.

[20594] LOC200895 (Accession NP_789785.1) is another GAM130 target gene, herein designated TARGET GENE. LOC200895 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200895, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200895 BINDING SITE, designated SEQ ID:6736, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20595] Another function of GAM130 is therefore inhibition of LOC200895 (Accession NP_789785.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200895.

[20596] LOC219731 (Accession XP_167596.1) is another GAM130 target gene, herein designated TARGET GENE. LOC219731 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219731, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:1485, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20597] Another function of GAM130 is therefore inhibition of LOC219731 (Accession XP_167596.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219731.

[20598] LOC282890 (Accession XP_212581.1) is another GAM130 target gene, herein designated TARGET GENE. LOC282890 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282890, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282890 BINDING SITE, designated SEQ ID:14621, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20599] Another function of GAM130 is therefore inhibition of LOC282890 (Accession XP_212581.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC282890.

[20600] LOC282927 (Accession XP_212629.1) is another GAM130 target gene, herein designated TARGET GENE. LOC282927 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282927 BINDING SITE, designated SEQ ID:14621, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20601] Another function of GAM130 is therefore inhibition of LOC282927 (Accession XP_212629.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282927.

[20602] LOC283177 (Accession XP_210903.1) is another GAM130 target gene, herein designated TARGET GENE. LOC283177 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC283177 BINDING SITE, designated SEQ ID:4745, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20603] Another function of GAM130 is therefore inhibition of LOC283177 (Accession XP_210903.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283177.

[20604] LOC283262 (Accession XP_210952.1) is another GAM130 target gene, herein designated TARGET GENE. LOC283262 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283262, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283262 BINDING SITE, designated SEQ ID:18890, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20605] Another function of GAM130 is therefore inhibition of LOC283262 (Accession XP_210952.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC283262.

[20606] LOC283278 (Accession XP_210961.1) is another GAM130 target gene, herein designated TARGET GENE. LOC283278 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283278, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283278 BINDING SITE, designated SEQ ID:14527, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20607] Another function of GAM130 is therefore inhibition of LOC283278 (Accession XP_210961.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283278.

[20608] LOC283323 (Accession XP_210973.1) is another GAM130 target gene, herein designated TARGET GENE. LOC283323 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283323 BINDING SITE, designated SEQ ID:8110, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20609] Another function of GAM130 is therefore inhibition of LOC283323 (Accession XP_210973.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283323.

[20610] LOC283387 (Accession XP_211007.1) is another GAM130 target gene, herein designated TARGET GENE. LOC283387 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283387, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283387 BINDING SITE, designated SEQ ID:15080, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20611] Another function of GAM130 is therefore inhibition of LOC283387 (Accession XP_211007.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283387.

[20612] LOC283863 (Accession XP_208875.1) is another GAM130 target gene, herein designated TARGET GENE. LOC283863 BINDING SITE1 and LOC283863 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC283863, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283863 BINDING SITE1 and LOC283863 BINDING SITE2, designated SEQ ID:7323 and SEQ ID:10774 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20613] Another function of GAM130 is therefore inhibition of LOC283863 (Accession XP_208875.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283863.

[20614] LOC283928 (Accession XP_208909.1) is another GAM130 target gene, herein designated TARGET GENE. LOC283928 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283928, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC283928 BINDING SITE, designated SEQ ID:17017, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20615] Another function of GAM130 is therefore inhibition of LOC283928 (Accession XP_208909.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283928.

[20616] LOC284016 (Accession XP_211298.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284016 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284016, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284016 BINDING SITE, designated SEQ ID:9226, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20617] Another function of GAM130 is therefore inhibition of LOC284016 (Accession XP_211298.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284016.

[20618] LOC284019 (Accession XP_211302.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284019 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284019, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284019 BINDING SITE, designated SEQ ID:13475, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20619] Another function of GAM130 is therefore inhibition of LOC284019 (Accession XP_211302.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284019.

[20620] LOC284102 (Accession XP_211327.3) is another GAM130 target gene, herein designated TARGET GENE. LOC284102 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284102, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC284102 BINDING SITE, designated SEQ ID:17387, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20621] Another function of GAM130 is therefore inhibition of LOC284102 (Accession XP_211327.3) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284102.

[20622] LOC284108 (Accession XP_211328.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284108 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284108, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284108 BINDING SITE, designated SEQ ID:16225, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20623] Another function of GAM130 is therefore inhibition of LOC284108 (Accession XP_211328.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284108.

[20624] LOC284145 (Accession XP_211353.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284145 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284145, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284145 BINDING SITE, designated SEQ ID:15416, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20625] Another function of GAM130 is therefore inhibition of LOC284145 (Accession XP_211353.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284145.

[20626] LOC284183 (Accession XP_209059.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284183 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284183, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284183 BINDING SITE, designated SEQ ID:8830, to

the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20627] Another function of GAM130 is therefore inhibition of LOC284183 (Accession XP_209059.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284183.

[20628] LOC284289 (Accession XP_209105.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284289 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284289, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284289 BINDING SITE, designated SEQ ID:19045, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20629] Another function of GAM130 is therefore inhibition of LOC284289 (Accession XP_209105.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284289.

[20630] LOC284304 (Accession XP_211426.1) is another GAM130

target gene, herein designated TARGET GENE. LOC284304 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284304, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284304 BINDING SITE, designated SEQ ID:16485, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20631] Another function of GAM130 is therefore inhibition of LOC284304 (Accession XP_211426.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284304.

[20632] LOC284362 (Accession XP_211435.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284362 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284362, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284362 BINDING SITE, designated SEQ ID:12705, to the nucleotide sequence of GAM130 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:331.

[20633] Another function of GAM130 is therefore inhibition of LOC284362 (Accession XP_211435.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284362.

[20634] LOC284375 (Accession XP_209154.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284375 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284375, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284375 BINDING SITE, designated SEQ ID:1561, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20635] Another function of GAM130 is therefore inhibition of LOC284375 (Accession XP_209154.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284375.

[20636] LOC284376 (Accession XP_209157.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284376

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284376 BINDING SITE, designated SEQ ID:9009, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20637] Another function of GAM130 is therefore inhibition of LOC284376 (Accession XP_209157.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284376.

[20638] LOC284405 (Accession XP_209183.2) is another GAM130 target gene, herein designated TARGET GENE. LOC284405 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284405, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284405 BINDING SITE, designated SEQ ID:4905, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20639] Another function of GAM130 is therefore inhibition of LOC284405 (Accession XP_209183.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284405.

[20640] LOC284408 (Accession XP_211443.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284408 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284408 BINDING SITE, designated SEQ ID:13699, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20641] Another function of GAM130 is therefore inhibition of LOC284408 (Accession XP_211443.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284408.

[20642] LOC284675 (Accession XP_209319.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284675 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC284675, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284675 BINDING SITE, designated SEQ ID:1879, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20643] Another function of GAM130 is therefore inhibition of LOC284675 (Accession XP_209319.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284675.

[20644] LOC284723 (Accession XP_211602.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284723 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284723, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284723 BINDING SITE, designated SEQ ID:18764, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20645] Another function of GAM130 is therefore inhibition of

LOC284723 (Accession XP_211602.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284723.

[20646] LOC284805 (Accession XP_209371.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284805 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284805 BINDING SITE, designated SEQ ID:11995, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20647] Another function of GAM130 is therefore inhibition of LOC284805 (Accession XP_209371.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284805.

[20648] LOC284839 (Accession XP_211661.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284839 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284839, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284839 BINDING SITE, designated SEQ ID:2803, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20649] Another function of GAM130 is therefore inhibition of LOC284839 (Accession XP_211661.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284839.

[20650] LOC284934 (Accession XP_211696.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284934 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284934, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284934 BINDING SITE, designated SEQ ID:5893, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20651] Another function of GAM130 is therefore inhibition of LOC284934 (Accession XP_211696.1) . Accordingly, utili-

ties of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284934.

[20652] LOC284982 (Accession XP_211721.1) is another GAM130 target gene, herein designated TARGET GENE. LOC284982 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284982, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284982 BINDING SITE, designated SEQ ID:1947, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20653] Another function of GAM130 is therefore inhibition of LOC284982 (Accession XP_211721.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284982.

[20654] LOC285058 (Accession XP_211753.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285058 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285058, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285058 BINDING SITE, designated SEQ ID:5847, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20655] Another function of GAM130 is therefore inhibition of LOC285058 (Accession XP_211753.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285058.

[20656] LOC285088 (Accession XP_209465.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285088 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285088, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285088 BINDING SITE, designated SEQ ID:2058, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20657] Another function of GAM130 is therefore inhibition of LOC285088 (Accession XP_209465.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285088.

[20658] LOC285169 (Accession XP_211797.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285169 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285169 BINDING SITE, designated SEQ ID:14805, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20659] Another function of GAM130 is therefore inhibition of LOC285169 (Accession XP_211797.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285169.

[20660] LOC285221 (Accession XP_209521.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285221 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285221, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285221 BINDING SITE, designated SEQ ID:8332, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20661] Another function of GAM130 is therefore inhibition of LOC285221 (Accession XP_209521.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285221.

[20662] LOC285281 (Accession XP_211829.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285281 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285281, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285281 BINDING SITE, designated SEQ ID:8457, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20663] Another function of GAM130 is therefore inhibition of LOC285281 (Accession XP_211829.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285281.

[20664] LOC285530 (Accession XP_209649.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285530 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285530, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285530 BINDING SITE, designated SEQ ID:2078, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20665] Another function of GAM130 is therefore inhibition of LOC285530 (Accession XP_209649.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285530.

[20666] LOC285813 (Accession XP_212036.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285813 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285813 BINDING SITE, designated SEQ ID:2870, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20667] Another function of GAM130 is therefore inhibition of LOC285813 (Accession XP_212036.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285813.

[20668] LOC285868 (Accession XP_209788.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285868 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285868, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285868 BINDING SITE, designated SEQ ID:9981, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20669] Another function of GAM130 is therefore inhibition of LOC285868 (Accession XP_209788.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285868.

[20670] LOC285924 (Accession XP_209816.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285924 BINDING SITE, designated SEQ ID:6287, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20671] Another function of GAM130 is therefore inhibition of LOC285924 (Accession XP_209816.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285924.

[20672] LOC285972 (Accession XP_212105.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285972 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285972, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285972 BINDING SITE, designated SEQ ID:9180, to

the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20673] Another function of GAM130 is therefore inhibition of LOC285972 (Accession XP_212105.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285972.

[20674] LOC285989 (Accession XP_212111.1) is another GAM130 target gene, herein designated TARGET GENE. LOC285989 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285989, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285989 BINDING SITE, designated SEQ ID:16032, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20675] Another function of GAM130 is therefore inhibition of LOC285989 (Accession XP_212111.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285989.

[20676] LOC286002 (Accession XP_212132.1) is another GAM130

target gene, herein designated TARGET GENE. LOC286002 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286002 BINDING SITE, designated SEQ ID:10926, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20677] Another function of GAM130 is therefore inhibition of LOC286002 (Accession XP_212132.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286002.

[20678] LOC286032 (Accession XP_209867.2) is another GAM130 target gene, herein designated TARGET GENE. LOC286032 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286032, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286032 BINDING SITE, designated SEQ ID:16758, to the nucleotide sequence of GAM130 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:331.

[20679] Another function of GAM130 is therefore inhibition of LOC286032 (Accession XP_209867.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286032.

[20680] LOC286039 (Accession XP_209873.1) is another GAM130 target gene, herein designated TARGET GENE. LOC286039 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286039, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286039 BINDING SITE, designated SEQ ID:9783, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20681] Another function of GAM130 is therefore inhibition of LOC286039 (Accession XP_209873.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286039.

[20682] LOC286078 (Accession XP_212163.1) is another GAM130 target gene, herein designated TARGET GENE. LOC286078

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286078 BINDING SITE, designated SEQ ID:13192, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20683] Another function of GAM130 is therefore inhibition of LOC286078 (Accession XP_212163.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286078.

[20684] LOC286341 (Accession XP_212278.1) is another GAM130 target gene, herein designated TARGET GENE. LOC286341 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286341, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286341 BINDING SITE, designated SEQ ID:6947, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20685] Another function of GAM130 is therefore inhibition of LOC286341 (Accession XP_212278.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286341.

[20686] LOC286401 (Accession XP_212310.1) is another GAM130 target gene, herein designated TARGET GENE. LOC286401 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286401, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286401 BINDING SITE, designated SEQ ID:15744, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20687] Another function of GAM130 is therefore inhibition of LOC286401 (Accession XP_212310.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286401.

[20688] LOC286467 (Accession XP_210063.1) is another GAM130 target gene, herein designated TARGET GENE. LOC286467 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC286467, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286467 BINDING SITE, designated SEQ ID:6673, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20689] Another function of GAM130 is therefore inhibition of LOC286467 (Accession XP_210063.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286467.

[20690] LOC286520 (Accession XP_212330.2) is another GAM130 target gene, herein designated TARGET GENE. LOC286520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286520 BINDING SITE, designated SEQ ID:4789, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20691] Another function of GAM130 is therefore inhibition of

LOC286520 (Accession XP_212330.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286520.

[20692] LOC338565 (Accession XP_294653.1) is another GAM130 target gene, herein designated TARGET GENE. LOC338565 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338565, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338565 BINDING SITE, designated SEQ ID:9751, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20693] Another function of GAM130 is therefore inhibition of LOC338565 (Accession XP_294653.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338565.

[20694] LOC338923 (Accession XP_294742.1) is another GAM130 target gene, herein designated TARGET GENE. LOC338923 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338923, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338923 BINDING SITE, designated SEQ ID:1240, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20695] Another function of GAM130 is therefore inhibition of LOC338923 (Accession XP_294742.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338923.

[20696] LOC339077 (Accession XP_294802.2) is another GAM130 target gene, herein designated TARGET GENE. LOC339077 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339077 BINDING SITE, designated SEQ ID:4115, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20697] Another function of GAM130 is therefore inhibition of LOC339077 (Accession XP_294802.2) . Accordingly, utili-

ties of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339077.

[20698] LOC339324 (Accession XP_290838.1) is another GAM130 target gene, herein designated TARGET GENE. LOC339324 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339324, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339324 BINDING SITE, designated SEQ ID:14109, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20699] Another function of GAM130 is therefore inhibition of LOC339324 (Accession XP_290838.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339324.

[20700] LOC339373 (Accession XP_294921.1) is another GAM130 target gene, herein designated TARGET GENE. LOC339373 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339373, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339373 BINDING SITE, designated SEQ ID:1840, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20701] Another function of GAM130 is therefore inhibition of LOC339373 (Accession XP_294921.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339373.

[20702] LOC339492 (Accession XP_290919.1) is another GAM130 target gene, herein designated TARGET GENE. LOC339492 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339492, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339492 BINDING SITE, designated SEQ ID:14527, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20703] Another function of GAM130 is therefore inhibition of LOC339492 (Accession XP_290919.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC339492.

[20704] LOC339833 (Accession XP_291031.1) is another GAM130 target gene, herein designated TARGET GENE. LOC339833 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339833, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339833 BINDING SITE, designated SEQ ID:3269, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20705] Another function of GAM130 is therefore inhibition of LOC339833 (Accession XP_291031.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339833.

[20706] LOC339874 (Accession XP_295090.1) is another GAM130 target gene, herein designated TARGET GENE. LOC339874 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339874, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC339874 BINDING SITE, designated SEQ ID:19270, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20707] Another function of GAM130 is therefore inhibition of LOC339874 (Accession XP_295090.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339874.

[20708] LOC340037 (Accession XP_295137.1) is another GAM130 target gene, herein designated TARGET GENE. LOC340037 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340037, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340037 BINDING SITE, designated SEQ ID:13921, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20709] Another function of GAM130 is therefore inhibition of LOC340037 (Accession XP_295137.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC340037.

[20710] LOC340390 (Accession XP_291269.1) is another GAM130 target gene, herein designated TARGET GENE. LOC340390 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340390, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340390 BINDING SITE, designated SEQ ID:5604, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20711] Another function of GAM130 is therefore inhibition of LOC340390 (Accession XP_291269.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340390.

[20712] LOC340408 (Accession XP_291274.1) is another GAM130 target gene, herein designated TARGET GENE. LOC340408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC340408 BINDING SITE, designated SEQ ID:9783, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20713] Another function of GAM130 is therefore inhibition of LOC340408 (Accession XP_291274.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340408.

[20714] LOC347644 (Accession XP_300206.1) is another GAM130 target gene, herein designated TARGET GENE. LOC347644 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347644, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347644 BINDING SITE, designated SEQ ID:14621, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20715] Another function of GAM130 is therefore inhibition of LOC347644 (Accession XP_300206.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347644.

[20716] LOC347905 (Accession XP_302624.1) is another GAM130 target gene, herein designated TARGET GENE. LOC347905 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347905, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347905 BINDING SITE, designated SEQ ID:8346, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20717] Another function of GAM130 is therefore inhibition of LOC347905 (Accession XP_302624.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347905.

[20718] LOC348115 (Accession XP_300626.1) is another GAM130 target gene, herein designated TARGET GENE. LOC348115 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348115 BINDING SITE, designated SEQ ID:16032, to

the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20719] Another function of GAM130 is therefore inhibition of LOC348115 (Accession XP_300626.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348115.

[20720] LOC348402 (Accession XP_300730.1) is another GAM130 target gene, herein designated TARGET GENE. LOC348402 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348402, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348402 BINDING SITE, designated SEQ ID:14527, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20721] Another function of GAM130 is therefore inhibition of LOC348402 (Accession XP_300730.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348402.

[20722] LOC348492 (Accession XP_300758.1) is another GAM130

target gene, herein designated TARGET GENE. LOC348492 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348492, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348492 BINDING SITE, designated SEQ ID:688, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20723] Another function of GAM130 is therefore inhibition of LOC348492 (Accession XP_300758.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348492.

[20724] LOC348528 (Accession XP_302814.1) is another GAM130 target gene, herein designated TARGET GENE. LOC348528 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348528, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348528 BINDING SITE, designated SEQ ID:19934, to the nucleotide sequence of GAM130 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:331.

[20725] Another function of GAM130 is therefore inhibition of LOC348528 (Accession XP_302814.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348528.

[20726] LOC348790 (Accession XP_300843.1) is another GAM130 target gene, herein designated TARGET GENE. LOC348790 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348790, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348790 BINDING SITE, designated SEQ ID:1047, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20727] Another function of GAM130 is therefore inhibition of LOC348790 (Accession XP_300843.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348790.

[20728] LOC348798 (Accession XP_300845.1) is another GAM130 target gene, herein designated TARGET GENE. LOC348798

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348798 BINDING SITE, designated SEQ ID:5380, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20729] Another function of GAM130 is therefore inhibition of LOC348798 (Accession XP_300845.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348798.

[20730] LOC349024 (Accession XP_300250.1) is another GAM130 target gene, herein designated TARGET GENE. LOC349024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349024 BINDING SITE, designated SEQ ID:3876, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20731] Another function of GAM130 is therefore inhibition of LOC349024 (Accession XP_300250.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349024.

[20732] LOC349251 (Accession XP_300251.1) is another GAM130 target gene, herein designated TARGET GENE. LOC349251 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349251, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349251 BINDING SITE, designated SEQ ID:19162, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20733] Another function of GAM130 is therefore inhibition of LOC349251 (Accession XP_300251.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349251.

[20734] LOC57107 (Accession NP_065114.2) is another GAM130 target gene, herein designated TARGET GENE. LOC57107 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC57107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:7276, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20735] Another function of GAM130 is therefore inhibition of LOC57107 (Accession NP_065114.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107.

[20736] LOC57146 (Accession NP_065155.2) is another GAM130 target gene, herein designated TARGET GENE. LOC57146 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57146 BINDING SITE, designated SEQ ID:1157, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20737] Another function of GAM130 is therefore inhibition of

LOC57146 (Accession NP_065155.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57146.

[20738] LOC85026 (Accession NP_116326.1) is another GAM130 target gene, herein designated TARGET GENE. LOC85026 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC85026, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC85026 BINDING SITE, designated SEQ ID:5403, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20739] Another function of GAM130 is therefore inhibition of LOC85026 (Accession NP_116326.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85026.

[20740] LOC90408 (Accession XP_031517.1) is another GAM130 target gene, herein designated TARGET GENE. LOC90408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90408, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:6139, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20741] Another function of GAM130 is therefore inhibition of LOC90408 (Accession XP_031517.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408.

[20742] LOC91115 (Accession XP_036218.1) is another GAM130 target gene, herein designated TARGET GENE. LOC91115 BINDING SITE1 and LOC91115 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC91115, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE1 and LOC91115 BINDING SITE2, designated SEQ ID:6171 and SEQ ID:17551 respectively, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20743] Another function of GAM130 is therefore inhibition of LOC91115 (Accession XP_036218.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115.

[20744] LOC91373 (Accession XP_038063.5) is another GAM130 target gene, herein designated TARGET GENE. LOC91373 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91373, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91373 BINDING SITE, designated SEQ ID:2713, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20745] Another function of GAM130 is therefore inhibition of LOC91373 (Accession XP_038063.5) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91373.

[20746] LOC93206 (Accession XP_049838.1) is another GAM130 target gene, herein designated TARGET GENE. LOC93206 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC93206, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93206 BINDING SITE, designated SEQ ID:6707, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20747] Another function of GAM130 is therefore inhibition of LOC93206 (Accession XP_049838.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93206.

[20748] Leucine zipper, putative tumor suppressor 1 (LZTS1, Accession NP_066300.1) is another GAM130 target gene, herein designated TARGET GENE. LZTS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LZTS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:3087, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20749] Another function of GAM130 is therefore inhibition of Leucine zipper, putative tumor suppressor 1 (LZTS1, Accession NP_066300.1), a gene which is an essential component of the nucleoskeleton. potential role in crosslinking filaments or anchoring other molecules. it is essential for growth. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1.

[20750] The function of LZTS1 has been established by previous studies. Ishii et al. (1999) positionally cloned and characterized the FEZ1/LZTS1 (leucine zipper, putative tumor suppressor- 1) gene at 8p22, a region that is lost in many tumors, including prostate, breast, head and neck, esophageal, and urinary bladder carcinomas. The predicted FEZ1 protein contained a leucine- zipper region with similarity to the DNA- binding domain of the cAMP-responsive activating transcription factor- 5 (OMIM Ref. No. 606398). Northern blot analysis revealed that FEZ2 is expressed almost ubiquitously in normal tissues, although expression is most abundant in testes. FEZ1 expression was undetectable in more than 60% of epithelial tumors, but FEZ1 mutations were found in primary esophageal cancers and in a prostate cancer cell line. Transcript anal-

ysis from several FEZ1- expressing tumors revealed truncated mRNAs, including a frameshift. Alteration and inactivation of the FEZ1 gene may play a role in various human tumors. Ishii et al. (2001) showed that introduction of FEZ1/LZTS1 into FEZ1/LZTS1- negative cancer cells resulted in suppression of tumorigenicity and reduced cell growth with accumulation of cells at late S- G2/M stage of the cell cycle. Their data showed that FEZ1/LZTS1 inhibits cancer cell growth through regulation of mitosis, and that its alterations result in abnormal cell growth

[20751]

[20752] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20753] Ishii, H.; Baffa, R.; Numata, S.- I.; Murakumo, Y.; Rattan, S.; Inoue, H.; Mori, M.; Fidanza, V.; Alder, H.; Croce, C. M. : The FEZ1 gene at chromosome 8p22 encodes a leucine-zipper protein, and its expression is altered in multiple human tumors. Proc. Nat. Acad. Sci. 96: 3928- 3933, 1999. ; and

[20754] Ishii, H.; Vecchione, A.; Murakumo, Y.; Baldassarre, G.; Numata, S.; Trapasso, F.; Alder, H.; Baffa, R.; Croce, C. M. : FEZ1/LZTS1 gene at 8p22 suppresses cancer cell growth

and regulat.

[20755] Further studies establishing the function and utilities of LZTS1 are found in John Hopkins OMIM database record ID 606551, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mads box transcription enhancer factor 2, polypeptide a (myocyte enhancer factor 2a) (MEF2A, Accession NP_005578.1) is another GAM130 target gene, herein designated TARGET GENE. MEF2A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MEF2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEF2A BINDING SITE, designated SEQ ID:10779, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20756] Another function of GAM130 is therefore inhibition of Mads box transcription enhancer factor 2, polypeptide a (myocyte enhancer factor 2a) (MEF2A, Accession NP_005578.1), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2A.

[20757] The function of MEF2A has been established by previous studies. The process of differentiation from mesodermal precursor cells to myoblasts has led to the discovery of a variety of tissue- specific factors that regulate muscle gene expression. The myogenic basic helix- loop- helix proteins, including myoD (OMIM Ref. No. 159970), myogenin (OMIM Ref. No. 159980), MYF5 (OMIM Ref. No. 159990), and MRF4 (OMIM Ref. No. 159991) are 1 class of identified factors. A second family of DNA binding regulatory proteins is the myocyte- specific enhancer factor- 2 (MEF2) family. Each of these proteins binds to the MEF2 target DNA sequence present in the regulatory regions of many, if not all, muscle- specific genes. The MEF2 genes are members of the MADS gene family (named for the yeast mating type- specific transcription factor MCM1, the plant homeotic genes 'agamous' and 'deficiens' and the human serum response factor SRF (OMIM Ref. No. 600589)), a family that also includes several homeotic genes and other transcription factors, all of which share a conserved DNA- binding domain. Pollock and Treisman (1991) cloned a cDNA for MEF2A, which they designated as a member of the RSRF (related to serum response factor) family. They also described the protein's DNA binding

properties and its potential role in regulation of growth factor- inducible and muscle specific sequences. MEF2A cDNAs were also obtained by Yu et al. (1992), who screened an expression library of primary human skeletal myocytes from vastus lateralis with a DNA probe containing multiple copies of the MEF2 binding sequence. The mRNA is ubiquitously expressed, with highest levels found in skeletal muscle, heart, and brain. Several alternative splice variants of MEF2A were identified that were predicted to encode different protein products. Using immunofluorescence, MEF2A protein was detected in the nuclei of skeletal and cardiac muscle cells. Hobson et al. (1995) mapped the MEF2A gene using somatic cell hybrid panel DNAs including deletion or derivative chromosome cell lines and regionalized it to 15q26 by fluorescence in situ hybridization (FISH) with a YAC shown to contain MEF2A. Mouse Mef2A was mapped by Martin et al. (1994) to chromosome 7. Suzuki et al. (1996) mapped the MEF2A gene to 15q26 by FISH. They isolated and mapped a partially processed pseudogene (OMIM Ref. No. MEF2AP) to 1q24- q25 by FISH.

[20758] Animal model experiments lend further support to the function of MEF2A. Naya et al. (2002) generated mice de-

ficient in Mef2a, the predominant Mef2 gene expressed in postnatal cardiac muscle. Most mice lacking Mef2a died suddenly within the first week of life and exhibited pronounced dilation of the right ventricle, myofibrillar fragmentation, mitochondrial disorganization, and activation of a fetal cardiac gene program. The few Mef2a null mice that survived to adulthood also showed a deficiency of cardiac mitochondria and susceptibility to sudden death.

[20759] It is appreciated that the abovementioned animal model for MEF2A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[20760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20761] Pollock, R.; Treisman, R. : Human SRF- related proteins: DNA- binding properties and potential regulatory targets. Genes Dev. 5: 2327- 2341, 1991. ; and

[20762] Suzuki, E.; Lowry, J.; Sonoda, G.; Testa, J. R.; Walsh, K. : Structures and chromosome locations of the human MEF2A gene and a pseudogene MEF2AP. Cytogenet. Cell Genet. 73: 244- 249, 1996.

[20763] Further studies establishing the function and utilities of

MEF2A are found in John Hopkins OMIM database record ID 600660, and in cited publications listed in Table 5, which are hereby incorporated by reference.MEGF11 (Accession NP_115821.1) is another GAM130 target gene, herein designated TARGET GENE. MEGF11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEGF11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEGF11 BINDING SITE, designated SEQ ID:19297, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20764] Another function of GAM130 is therefore inhibition of MEGF11 (Accession NP_115821.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF11.

[20765] MGC13138 (Accession NP_219363.1) is another GAM130 target gene, herein designated TARGET GENE. MGC13138 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13138, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:19675, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20766] Another function of GAM130 is therefore inhibition of MGC13138 (Accession NP_219363.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13138.

[20767] MGC19556 (Accession NP_291029.1) is another GAM130 target gene, herein designated TARGET GENE. MGC19556 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC19556, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:11634, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20768] Another function of GAM130 is therefore inhibition of MGC19556 (Accession NP_291029.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC19556.

[20769] MGC21675 (Accession NP_443093.1) is another GAM130 target gene, herein designated TARGET GENE. MGC21675 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC21675, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC21675 BINDING SITE, designated SEQ ID:16032, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20770] Another function of GAM130 is therefore inhibition of MGC21675 (Accession NP_443093.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21675.

[20771] MGC2474 (Accession NP_076420.1) is another GAM130 target gene, herein designated TARGET GENE. MGC2474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:6895, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20772] Another function of GAM130 is therefore inhibition of MGC2474 (Accession NP_076420.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474.

[20773] MGC26706 (Accession NP_689794.1) is another GAM130 target gene, herein designated TARGET GENE. MGC26706 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC26706, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC26706 BINDING SITE, designated SEQ ID:12477, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20774] Another function of GAM130 is therefore inhibition of MGC26706 (Accession NP_689794.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC26706.

[20775] MGC27345 (Accession XP_300964.1) is another GAM130 target gene, herein designated TARGET GENE. MGC27345 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MGC27345, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC27345 BINDING SITE, designated SEQ ID:18775, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20776] Another function of GAM130 is therefore inhibition of MGC27345 (Accession XP_300964.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27345.

[20777] MGC3329 (Accession NP_076991.2) is another GAM130 target gene, herein designated TARGET GENE. MGC3329 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3329, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC3329 BINDING SITE, designated SEQ ID:16011, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20778] Another function of GAM130 is therefore inhibition of MGC3329 (Accession NP_076991.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3329.

[20779] MGC35468 (Accession NP_694976.1) is another GAM130 target gene, herein designated TARGET GENE. MGC35468 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC35468, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35468 BINDING SITE, designated SEQ ID:2083, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20780] Another function of GAM130 is therefore inhibition of MGC35468 (Accession NP_694976.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC35468.

[20781] MGC3771 (Accession NP_112232.1) is another GAM130 target gene, herein designated TARGET GENE. MGC3771 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC3771, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3771 BINDING SITE, designated SEQ ID:17353, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20782] Another function of GAM130 is therefore inhibition of MGC3771 (Accession NP_112232.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3771.

[20783] MGC40579 (Accession NP_689989.1) is another GAM130 target gene, herein designated TARGET GENE. MGC40579 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC40579, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC40579 BINDING SITE, designated SEQ ID:16272, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20784] Another function of GAM130 is therefore inhibition of MGC40579 (Accession NP_689989.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40579.

[20785] MGC50452 (Accession NP_775733.1) is another GAM130 target gene, herein designated TARGET GENE. MGC50452 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC50452, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC50452 BINDING SITE, designated SEQ ID:1368, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20786] Another function of GAM130 is therefore inhibition of MGC50452 (Accession NP_775733.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC50452.

[20787] MGRN1 (Accession XP_048119.4) is another GAM130 target gene, herein designated TARGET GENE. MGRN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGRN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGRN1 BINDING SITE, designated SEQ ID:16033, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20788] Another function of GAM130 is therefore inhibition of MGRN1 (Accession XP_048119.4) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGRN1.

[20789] Melan-a (MLANA, Accession NP_005502.1) is another GAM130 target gene, herein designated TARGET GENE. MLANA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MLANA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLANA BINDING SITE, designated SEQ ID:10945, to the nucleotide sequence of GAM130 RNA, herein designated

GAM RNA, also designated SEQ ID:331.

[20790] Another function of GAM130 is therefore inhibition of Melan-a (MLANA, Accession NP_005502.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLANA.

[20791] Myeloid leukemia factor 1 (MLF1, Accession NP_071888.1) is another GAM130 target gene, herein designated TARGET GENE. MLF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MLF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLF1 BINDING SITE, designated SEQ ID:15324, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20792] Another function of GAM130 is therefore inhibition of Myeloid leukemia factor 1 (MLF1, Accession NP_071888.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLF1.

[20793] NAP4 (Accession XP_294897.2) is another GAM130 target gene, herein designated TARGET GENE. NAP4 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NAP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAP4 BINDING SITE, designated SEQ ID:6341, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20794] Another function of GAM130 is therefore inhibition of NAP4 (Accession XP_294897.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP4.

[20795] NCAG1 (Accession NP_115536.1) is another GAM130 target gene, herein designated TARGET GENE. NCAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCAG1 BINDING SITE, designated SEQ ID:11087, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20796] Another function of GAM130 is therefore inhibition of

NCAG1 (Accession NP_115536.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCAG1.

[20797] Ndrg family member 3 (NDRG3, Accession NP_114402.1) is another GAM130 target gene, herein designated TARGET GENE. NDRG3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NDRG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE, designated SEQ ID:10779, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20798] Another function of GAM130 is therefore inhibition of Ndrg family member 3 (NDRG3, Accession NP_114402.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3.

[20799] NOSIP (Accession NP_057037.1) is another GAM130 target gene, herein designated TARGET GENE. NOSIP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NOSIP, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NOSIP BINDING SITE, designated SEQ ID:6878, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20800] Another function of GAM130 is therefore inhibition of NOSIP (Accession NP_057037.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOSIP.

[20801] 5'-nucleotidase, cytosolic ii (NT5C2, Accession NP_036361.1) is another GAM130 target gene, herein designated TARGET GENE. NT5C2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NT5C2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NT5C2 BINDING SITE, designated SEQ ID:20125, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20802] Another function of GAM130 is therefore inhibition of 5'-nucleotidase, cytosolic ii (NT5C2, Accession

NP_036361.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C2.

[20803] NUP43 (Accession NP_078923.2) is another GAM130 target gene, herein designated TARGET GENE. NUP43 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUP43, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP43 BINDING SITE, designated SEQ ID:14929, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20804] Another function of GAM130 is therefore inhibition of NUP43 (Accession NP_078923.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP43.

[20805] Oxysterol binding protein-like 2 (OSBPL2, Accession NP_055650.1) is another GAM130 target gene, herein designated TARGET GENE. OSBPL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL2, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE, designated SEQ ID:16028, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20806] Another function of GAM130 is therefore inhibition of Oxysterol binding protein-like 2 (OSBPL2, Accession NP_055650.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2.

[20807] Oxysterol binding protein-like 2 (OSBPL2, Accession NP_653081.1) is another GAM130 target gene, herein designated TARGET GENE. OSBPL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE, designated SEQ ID:16028, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20808] Another function of GAM130 is therefore inhibition of Oxysterol binding protein-like 2 (OSBPL2, Accession

NP_653081.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2.

[20809] Pas domain containing serine/threonine kinase (PASK, Accession NP_055963.1) is another GAM130 target gene, herein designated TARGET GENE. PASK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PASK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PASK BINDING SITE, designated SEQ ID:12272, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20810] Another function of GAM130 is therefore inhibition of Pas domain containing serine/threonine kinase (PASK, Accession NP_055963.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PASK.

[20811] Protocadherin beta 14 (PCDHB14, Accession NP_061757.1) is another GAM130 target gene, herein designated TARGET GENE. PCDHB14 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by PCDHB14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHB14 BINDING SITE, designated SEQ ID:2918, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20812] Another function of GAM130 is therefore inhibition of Protocadherin beta 14 (PCDHB14, Accession NP_061757.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB14.

[20813] Period homolog 2 (drosophila) (PER2, Accession NP_073728.1) is another GAM130 target gene, herein designated TARGET GENE. PER2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PER2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:2668, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20814] Another function of GAM130 is therefore inhibition of Period homolog 2 (drosophila) (PER2, Accession NP_073728.1), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain and therefore may be associated with Familial advanced sleep- phase syndrome. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Familial advanced sleep- phase syndrome, and of other diseases and clinical conditions associated with PER2.

[20815] The function of PER2 has been established by previous studies. To investigate the biologic role of NPAS2 (OMIM Ref. No. 603347), Reick et al. (2001) prepared a neuroblastoma cell line capable of conditional induction of the NPAS2:BMAL1 (OMIM Ref. No. 602550) heterodimer and identified putative target genes by representational difference analysis, DNA microarrays, and Northern blotting. Coinduction of NPAS2 and BMAL1 activated transcription of the endogenous Per1, Per2, and Cry1 (OMIM Ref. No. 601933) genes, which encode negatively activating components of the circadian regulatory apparatus, and repressed transcription of the endogenous BMAL1 gene. Analysis of the frontal cortex of wildtype mice kept in a 24- hour light- dark cycle revealed that Per1, Per2, and

Cry1 mRNA levels were elevated during darkness and reduced during light, whereas BMAL1 mRNA displayed the opposite pattern. In situ hybridization assays of mice kept in constant darkness revealed that Per2 mRNA abundance did not oscillate as a function of circadian cycle in NPAS2-deficient mice. Thus, NPAS2 likely functions as part of a molecular clock operative in the mammalian forebrain.

[20816] Animal model experiments lend further support to the function of PER2. Shearman et al. (2000) demonstrated that in the mouse, the core mechanism for the master circadian clock consists of interacting positive and negative transcription and translation feedback loops. Analysis of Clock/Clock (OMIM Ref. No. 601851) mutant mice, homozygous Per2 mutants, and Cry- deficient mice revealed substantially altered Bmal1 (OMIM Ref. No. 602550) rhythms, consistent with a dominant role of Per2 in the positive regulation of the Bmal1 loop. In vitro analysis of Cry inhibition of Clock:Bmal1- mediated transcription shows that the inhibition is through direct protein- protein interactions, independent of the Per and Tim (OMIM Ref. No. 603887) proteins. Per2 is a positive regulator of the Bmal1 loop, and Cry1 and Cry2 are the negative regulators of the Period and Cryptochrome cycles.

[20817] It is appreciated that the abovementioned animal model for PER2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[20818] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20819] Shearman, L. P.; Sriram, S.; Weaver, D. R.; Maywood, E. S.; Chaves, I.; Zheng, B.; Kume, K.; Lee, C. C.; van der Horst, G. T. J.; Hastings, M. H.; Reppert, S. M. : Interacting molecular loops in the mammalian circadian clock. Science 288: 1013- 1019, 2000. ; and

[20820] Shearman, L. P.; Zylka, M. J.; Weaver, D. R.; Kolakowski, L. F., Jr.; Reppert, S. M. : Two period homologs: circadian expression and photic regulation in the suprachiasmatic nuclei. Neu.

[20821] Further studies establishing the function and utilities of PER2 are found in John Hopkins OMIM database record ID 603426, and in cited publications listed in Table 5, which are hereby incorporated by reference.PEX5R (Accession NP_057643.1) is another GAM130 target gene, herein designated TARGET GENE. PEX5R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by PEX5R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEX5R BINDING SITE, designated SEQ ID:4446, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20822] Another function of GAM130 is therefore inhibition of PEX5R (Accession NP_057643.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX5R.

[20823] Pbx/knotted 1 homeobox 1 (PKNOX1, Accession NP_004562.2) is another GAM130 target gene, herein designated TARGET GENE. PKNOX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKNOX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKNOX1 BINDING SITE, designated SEQ ID:14526, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20824] Another function of GAM130 is therefore inhibition of Pbx/knotted 1 homeobox 1 (PKNOX1, Accession

NP_004562.2), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX1.

[20825] The function of PKNOX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.Protein phosphatase, ef hand calcium-binding domain 2 (PPEF2, Accession NP_006230.2) is another GAM130 target gene, herein designated TARGET GENE. PPEF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPEF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPEF2 BINDING SITE, designated SEQ ID:6206, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20826] Another function of GAM130 is therefore inhibition of Protein phosphatase, ef hand calcium-binding domain 2 (PPEF2, Accession NP_006230.2), a gene which is a homolog of Drosophila rdgC. Accordingly, utilities of

GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPEF2.

[20827] The function of PPEF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Protein phosphatase, ef hand calcium-binding domain 2 (PPEF2, Accession NP_690911.1) is another GAM130 target gene, herein designated TARGET GENE. PPEF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPEF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPEF2 BINDING SITE, designated SEQ ID:6206, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20828] Another function of GAM130 is therefore inhibition of Protein phosphatase, ef hand calcium-binding domain 2 (PPEF2, Accession NP_690911.1), a gene which is a homolog of Drosophila rdgC. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPEF2.

[20829] The function of PPEF2 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Protein phosphatase, ef hand calcium-binding domain 2 (PPEF2, Accession NP_690910.1) is another GAM130 target gene, herein designated TARGET GENE. PPEF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPEF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPEF2 BINDING SITE, designated SEQ ID:6206, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20830] Another function of GAM130 is therefore inhibition of Protein phosphatase, ef hand calcium-binding domain 2 (PPEF2, Accession NP_690910.1), a gene which is a homolog of Drosophila rdgC. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPEF2.

[20831] The function of PPEF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Protein kinase, y-linked (PRKY, Accession

NP_002751.1) is another GAM130 target gene, herein designated TARGET GENE. PRKY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKY BINDING SITE, designated SEQ ID:9776, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20832] Another function of GAM130 is therefore inhibition of Protein kinase, y-linked (PRKY, Accession NP_002751.1), a gene which is a putative protein kinase. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKY.

[20833] The function of PRKY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Prion protein 2 (dublet) (PRND, Accession NP_036541.1) is another GAM130 target gene, herein designated TARGET GENE. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRND BINDING SITE, designated SEQ ID:2712, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20834] Another function of GAM130 is therefore inhibition of Prion protein 2 (dublet) (PRND, Accession NP_036541.1), a gene which is similar to prion protein PRNP. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRND.

[20835] The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM116.1.Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession NP_000952.1) is another GAM130 target gene, herein designated TARGET GENE. PTGIS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGIS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:15449, to the nucleotide se-

quence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20836] Another function of GAM130 is therefore inhibition of Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession NP_000952.1), a gene which catalyzes the isomerization of prostaglandin h2 to prostacyclin (= prostaglandin i2). Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGIS.

[20837] The function of PTGIS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NP_542158.1) is another GAM130 target gene, herein designated TARGET GENE. PTGS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTGS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE, designated SEQ ID:10350, to the nucleotide sequence of GAM130 RNA, herein designated

GAM RNA, also designated SEQ ID:331.

[20838] Another function of GAM130 is therefore inhibition of Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NP_542158.1), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1.

[20839] The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NP_000953.2) is another GAM130 target gene, herein designated TARGET GENE. PTGS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTGS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE, designated SEQ ID:10350, to the nucleotide sequence of GAM130 RNA, herein designated

GAM RNA, also designated SEQ ID:331.

[20840] Another function of GAM130 is therefore inhibition of Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NP_000953.2), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1.

[20841] The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Protein tyrosine phosphatase, receptor type, k (PTPRK, Accession NP_002835.2) is another GAM130 target gene, herein designated TARGET GENE. PTPRK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTPRK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPRK BINDING SITE, designated SEQ ID:3473, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20842] Another function of GAM130 is therefore inhibition of Protein tyrosine phosphatase, receptor type, k (PTPRK, Accession NP_002835.2), a gene which regulates of processes involving cell contact and adhesion. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRK.

[20843] The function of PTPRK has been established by previous studies. For general information about receptor- type protein- tyrosine phosphatases (PTPs), see PTPRA (OMIM Ref. No. 176884). Yang et al. (1997) used degenerate PCR to identify novel receptor PTPs in a human keratinocyte cDNA library. One of the genes identified was the human homolog of mouse PTPR- kappa. Human PTPR- kappa encodes a 1,440- amino acid polypeptide that is 98% identical to mouse PTPR- kappa. Northern blotting revealed that PTPR- kappa is expressed as a 7.0- kb transcript in a variety of tissues. Fuchs et al. (1996) also used degenerate PCR to clone human PTPR- kappa. Northern blotting revealed expression of PTPR- kappa in mammary carcinoma cell lines as well as in various tissues. Fuchs et al. (1996) noted that PTPR- kappa has several structural features, such as a MAM domain, an Ig- like domain, and fi-

bronectin repeats, suggesting that it could be involved in cell adhesion. They showed that PTPR- kappa forms a complex with beta- catenin (OMIM Ref. No. 116806) and gamma- catenin/plakoglobin (OMIM Ref. No. 173325). They also showed that PTPR- kappa expression is dependent on cell density and that it colocalizes with catenins at adherens junctions. These findings suggest that PTPR-kappa may have a role in the regulation of processes involving cell contact and adhesion.

[20844]

[20845] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20846] Fuchs, M.; Muller, T.; Lerch, M. M.; Ullrich, A. : Association of human protein- tyrosine phosphatase kappa with members of the armadillo family. J. Biol. Chem. 271: 16712- 16719, 1996. ; and

[20847] Yang, Y.; Gil, M. C.; Choi, E. Y.; Park, S. H.; Pyun, K. H.; Ha, H. : Molecular cloning and chromosomal localization of a human gene homologous to the murine R- PTP- kappa, a receptor- type.

[20848] Further studies establishing the function and utilities of PTPRK are found in John Hopkins OMIM database record

ID 602545, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rab36, member ras oncogene family (RAB36, Accession NP_004905.1) is another GAM130 target gene, herein designated TARGET GENE. RAB36 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB36, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB36 BINDING SITE, designated SEQ ID:2081, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20849] Another function of GAM130 is therefore inhibition of Rab36, member ras oncogene family (RAB36, Accession NP_004905.1), a gene which is involved in protein transport. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB36.

[20850] The function of RAB36 has been established by previous studies. Homozygous deletions at chromosome 22q11.2 are a recurrent cytogenetic characteristic of malignant rhabdoid tumors (MRTs), suggesting the presence of a tumor suppressor gene in this region. Mori et al. (1999)

constructed a deletion map of the relevant part of 22q11.2 from a panel of 7 MRT cell lines, and isolated a novel gene from the center of the region. The gene, designated RAB36, spans approximately 19 kb of genomic DNA and contains 11 exons. It encodes a deduced 333-amino acid protein that contains 3 phosphate/magnesium- binding motifs, 3 guanine- binding motifs, a tyrosine kinase phosphorylation site, and a C- terminal isoprenylation signal. It shares high amino acid sequence identity with mouse Rab23 (OMIM Ref. No. 606144) and human RAB13 (OMIM Ref. No. 602672). Northern blot analysis revealed 4.0- and 2.2- kb mRNAs in all human tissues examined. The larger transcript contains a longer 3- prime noncoding sequence. RT- PCR analysis revealed expression of RAB36 mRNAs in 1 MRT cell line and overexpression in 2 others. Direct sequencing of cDNA from these 3 cell lines showed neither nonsense nor frameshift mutations. Moreover, a colony- formation assay indicated that RAB36 is not concerned with cell proliferation or cell death. The authors thus concluded that RAB36 does not have a tumor suppressor function. Immunofluorescence studies localized RAB36 at the Golgi body, suggesting that RAB36, like some other Rab family proteins, is involved in

vesicular transport around the Golgi apparatus. By use of exon trapping and large- scale genomic sequence analysis of 2 BAC clones, Zhou et al. (2000) also isolated RAB36, as well as another gene, RTDR1 (OMIM Ref. No. 605663), in the 22q11.2 region. They determined that RAB36 contains 11 exons. They also found no RAB36 mutations in rhab- doid tumor samples.

[20851]

[20852] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20853] Mori, T.; Fukuda, Y.; Kuroda, H.; Matsumura, T.; Ota, S.; Sugimoto, T.; Nakamura, Y.; Inazawa, J. : Cloning and characterization of a novel Rab- family gene, Rab36, within the region at 22q11.2 that is homozygously deleted in malignant rhabdoid tumors. Biochem. Biophys. Res. Commun. 254: 594- 600, 1999. ; and

[20855] Further studies establishing the function and utilities of RAB36 are found in John Hopkins OMIM database record

ID 605662, and in cited publications listed in Table 5, which are hereby incorporated by reference.RNF144 (Accession NP_055561.1) is another GAM130 target gene, herein designated TARGET GENE. RNF144 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF144, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF144 BINDING SITE, designated SEQ ID:4275, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20856] Another function of GAM130 is therefore inhibition of RNF144 (Accession NP_055561.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF144.

[20857] Retinitis pigmentosa 2 (x-linked recessive) (RP2, Accession NP_008846.1) is another GAM130 target gene, herein designated TARGET GENE. RP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:14528, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20858] Another function of GAM130 is therefore inhibition of Retinitis pigmentosa 2 (x-linked recessive) (RP2, Accession NP_008846.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2.

[20859] Sex comb on midleg-like 2 (drosophila) (SCML2, Accession NP_006080.1) is another GAM130 target gene, herein designated TARGET GENE. SCML2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCML2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCML2 BINDING SITE, designated SEQ ID:15934, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20860] Another function of GAM130 is therefore inhibition of Sex comb on midleg-like 2 (drosophila) (SCML2, Accession

NP_006080.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML2.

[20861] Spondyloepiphyseal dysplasia, late (SEDL, Accession NP_055378.1) is another GAM130 target gene, herein designated TARGET GENE. SEDL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEDL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE, designated SEQ ID:5004, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20862] Another function of GAM130 is therefore inhibition of Spondyloepiphyseal dysplasia, late (SEDL, Accession NP_055378.1), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. and therefore may be associated with Spondyloepiphyseal dysplasia. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Spondyloepiphyseal dysplasia, and of other diseases and clinical conditions associated with SEDL.

[20863] The function of SEDL and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Tal1 (scl) interrupting locus (SIL, Accession NP_003026.1) is another GAM130 target gene, herein designated TARGET GENE. SIL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIL BINDING SITE, designated SEQ ID:7982, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20864] Another function of GAM130 is therefore inhibition of Tal1 (scl) interrupting locus (SIL, Accession NP_003026.1), a gene which may be required for axial development and left- right specification and therefore may be associated with Prominent midline neural tube defects, abnormal left- right development. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Prominent midline neural tube defects, abnormal left- right development, and of other diseases and clinical conditions associated with SIL.

[20865] The function of SIL and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Signal-regulatory protein beta 1 (SIRPB1, Accession NP_006056.1) is another GAM130 target gene, herein designated TARGET GENE. SIRPB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:2065, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20866] Another function of GAM130 is therefore inhibition of Signal-regulatory protein beta 1 (SIRPB1, Accession NP_006056.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1.

[20867] Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NP_005064.1) is another GAM130 target gene, herein designated TARGET GENE. SLC15A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC15A1,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:2082, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20868] Another function of GAM130 is therefore inhibition of Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NP_005064.1), a gene which is a H(+)- coupled peptide transporter. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC15A1.

[20869] The function of SLC15A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Solute carrier family 24 (sodium/potassium/calcium exchanger), member 1 (SLC24A1, Accession NP_004718.1) is another GAM130 target gene, herein designated TARGET GENE. SLC24A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC24A1, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC24A1 BINDING SITE, designated SEQ ID:19932, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20870] Another function of GAM130 is therefore inhibition of Solute carrier family 24 (sodium/potassium/calcium exchanger), member 1 (SLC24A1, Accession NP_004718.1), a gene which is a critical component of the visual transduction cascade, controlling the calcium concentration of outer segments during light and darkness. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC24A1.

[20871] The function of SLC24A1 has been established by previous studies. By screening a human retinal cDNA library using the entire bovine rod sodium/potassium/calcium (Na- Ca+K) exchanger cDNA as a probe, Tucker et al. (1998) cloned the human NCKX1 gene. Human NCKX1 codes for a protein of 1,081 amino acids that shows 64% overall identity with the bovine protein. The 2 sets of putative transmembrane domains and their short connecting loops showed 94% identity, while the extracellular loop at

the amino terminus was only 59% identical. Tucker et al. (1998) determined the genomic structure of the NCKX1 gene and found 1 intron in the 5- prime untranslated region and 8 within the coding region. Exon length varies from 54 to 2,037 bp Using fluorescence in situ hybridization and analysis of a radiation hybrid panel, Tucker et al. (1998) mapped the NCKX1 gene to chromosome 15q22

[20872]

[20873] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20874] Tucker, J. E.; Winkfein, R. J.; Cooper, C. B.; Schnetkamp, P. P. : cDNA cloning of the human retinal rod Na- Ca + K exchanger: comparison with a revised bovine sequence. Invest. Ophthal. Vis. Sci. 39: 435- 440, 1998. ; and

[20875] Tucker, J. E.; Winkfein, R. J.; Murthy, S. K.; Friedman, J. S.; Walter, M. A.; Demetrick, D. J.; Schnetkamp, P. P. M. : Chromosomal localization and genomic organization of the human retina.

[20876] Further studies establishing the function and utilities of SLC24A1 are found in John Hopkins OMIM database record ID 603617, and in cited publications listed in Table 5, which are hereby incorporated by reference.SLC35E2

(Accession XP_049733.6) is another GAM130 target gene, herein designated TARGET GENE. SLC35E2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC35E2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC35E2 BINDING SITE, designated SEQ ID:13221, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20877] Another function of GAM130 is therefore inhibition of SLC35E2 (Accession XP_049733.6) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC35E2.

[20878] Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_620710.1) is another GAM130 target gene, herein designated TARGET GENE. SMARCD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE, designated SEQ ID:3343, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20879] Another function of GAM130 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_620710.1), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1.

[20880] The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM42.1.Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_003067.2) is another GAM130 target gene, herein designated TARGET GENE. SMARCD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of SMARCD1 BINDING SITE, designated SEQ ID:3343, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20881] Another function of GAM130 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_003067.2), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1.

[20882] The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM42.1.SNARK (Accession NP_112214.1) is another GAM130 target gene, herein designated TARGET GENE. SNARK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNARK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNARK BINDING SITE, designated SEQ ID:15170, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20883] Another function of GAM130 is therefore inhibition of SNARK (Accession NP_112214.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNARK.

[20884] SNX22 (Accession NP_079074.1) is another GAM130 target gene, herein designated TARGET GENE. SNX22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNX22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX22 BINDING SITE, designated SEQ ID:15559, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20885] Another function of GAM130 is therefore inhibition of SNX22 (Accession NP_079074.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX22.

[20886] Sialophorin (gpl115, leukosialin, cd43) (SPN, Accession NP_003114.1) is another GAM130 target gene, herein designated TARGET GENE. SPN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPN, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPN BINDING SITE, designated SEQ ID:7729, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20887] Another function of GAM130 is therefore inhibition of Sialophorin (gpl115, leukosialin, cd43) (SPN, Accession NP_003114.1), a gene which plays a role in the physico-chemical properties of the t- cell surface and in lectin binding. presents carbohydrate ligands to selectins. . and therefore may be associated with Wiskott- aldrich syndrome. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Wiskott- aldrich syndrome, and of other diseases and clinical conditions associated with SPN.

[20888] The function of SPN has been established by previous studies. Sialophorin is defective in lymphocytes of patients with Wiskott- Aldrich syndrome (OMIM Ref. No. 301000). Since the Wiskott- Aldrich syndrome is X- linked, its primary cause must reside in a defect of a gene other than the structural gene for sialophorin. (The existence of an autosomal form of Wiskott- Aldrich syndrome has been suggested (OMIM Ref. No. 277970).) Specific interaction of

CD43 with a ligand on the surface of T cells appears to contribute to T- cell activation. Rosenstein et al. (1991) presented evidence that intercellular adhesion molecule-1 (ICAM1, or CD54; 147840) is a ligand for CD43. Rosenstein et al. (1991) suggested that the defect in T- cell function in Wiskott- Aldrich syndrome may result from defective CD43/ICAM1 interaction. Many patients with HIV infection have circulating anti- CD43 antibodies; these autoantibodies may contribute to the severe immunodeficiency found in AIDS patients. The immunologic synapse is the T cell- APC (antigen- presenting cell) contact site where T- cell receptors (TCRs), coreceptors, signaling molecules, and adhesion receptors polarize upon antigen recognition. The formation of the immunologic synapse is thought to be important for receptor signal transduction and full T- lymphocyte activation. CD43 is a large sialoprotein diffusely expressed in unactivated T cells. Using antigen- activated T cells and confocal microscopy, Delon et al. (2001) demonstrated that moesin (OMIM Ref. No. 309845) is excluded from the region of T cell- APC contact and colocalizes with CD43. Western blot and immunocytochemical analyses showed that moesin is rapidly dephosphorylated upon antigen recognition and then

rephosphorylated on threonine residues. Only phosphorylated moesin was able to bind CD43. Delon et al. (2001) concluded that T- cell activation requires the removal of CD43 from the immunologic synapse to allow efficient engagement of the TCR with molecules on the APC.

[20889]

[20890] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20891] Rosenstein, Y.; Park, J. K.; Hahn, W. C.; Rosen, F. S.; Bierer, B. E.; Burakoff, S. J. : CD43, a molecule defective in Wiskott- Aldrich syndrome, binds ICAM- 1. Nature 354: 233- 235, 1991. ; and

[20892] Delon, J.; Kaibuchi, K.; Germain, R. N. : Exclusion of CD43 from the immunological synapse is mediated by phosphorylation- regulated relocation of the cytoskeletal adaptor moesin. Immunity 1.

[20893] Further studies establishing the function and utilities of SPN are found in John Hopkins OMIM database record ID 182160, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synovial sarcoma translocation, chromosome 18 (SS18, Accession NP_005628.1) is another GAM130 target gene, herein

designated TARGET GENE. SS18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SS18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SS18 BINDING SITE, designated SEQ ID:16460, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20894] Another function of GAM130 is therefore inhibition of Synovial sarcoma translocation, chromosome 18 (SS18, Accession NP_005628.1), a gene which is a putative transcriptional activator. and therefore is associated with Human synovial sarcomas. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Human synovial sarcomas., and of other diseases and clinical conditions associated with SS18.

[20895] The function of SS18 has been established by previous studies. Human synovial sarcomas contain a recurrent and specific chromosomal translocation t(X;18)(p11.2;q11.2). By screening a synovial sarcoma cDNA library with a YAC spanning the X chromosome breakpoint, Clark et al. (1994) identified a hybrid transcript that contained 5-

prime sequences mapping to chromosome 18 and 3-prime sequences mapping to the X chromosome (see OMIM Ref. No. SSX1; 312820). A probe from the chromosome 18 gene sequence, symbolized SS18, detected genomic rearrangements in 10 of 13 synovial sarcomas. The chromosome 18 gene was symbolized SYT by Clark et al. (1994), but that symbol had already been used for synaptotagmin (OMIM Ref. No. 185605). Sequencing of cDNA clones showed that the normal SS18 gene encodes a protein rich in glutamine, proline, and glycine, and that in synovial sarcoma, rearrangement of the SS18 gene results in the formation of a fusion protein. Both the chromosome 18 and the X chromosome components failed to exhibit significant homology to known gene sequences. The SYT protein appears to act as a transcriptional coactivator and the SSX proteins as corepressors. Thaete et al. (1999) investigated the functional domains of the proteins. The SYT protein was found to contain a novel conserved 54- amino acid domain at the N terminus of the protein (the SNH domain) that is found in proteins from a wide variety of species, and a C- terminal domain, rich in glutamine, proline, glycine, and tyrosine (the QPGY domain), which contains the transcriptional activator sequences. Deletion of

the SNH domain resulted in a more active transcriptional activator, suggesting that this domain acts as an inhibitor of the activation domain. The C- terminal SSX domain present in the SYT- SSX translocation protein contributes a transcriptional repressor domain to the protein. Thus, the fusion protein has transcriptional activating and repressing domains. Thaete et al. (1999) demonstrated that the human homolog of the SNF2/Brahma protein BRM (SMARCA2; 600014) colocalizes with SYT and SYT- SSX in nuclear speckles, and also interacts with SYT and SYT-SSX proteins in vitro. They suggested that this interaction may provide an explanation of how the SYT protein activates gene transcription.

[20896]

[20897] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20898] Clark, J.; Rocques, P. J.; Crew, A. J.; Gill, S.; Shipley, J.; Chan, A. M.- L.; Gusterson, B. A.; Cooper, C. S. : Identification of novel genes, SYT and SSX, involved in the t(X;18)(p11.2;q11.2) translocation found in human synovial sarcoma. Nature Genet. 7: 502- 508, 1994. ; and

[20899] Thaete, C.; Brett, D.; Monaghan, P.; Whitehouse, S.; Ren-

nie, G.; Rayner, E.; Cooper, C. S.; Goodwin, G. : Functional domains of the SYT and SYT- SSX synovial sarcoma translocation prote.

[20900] Further studies establishing the function and utilities of SS18 are found in John Hopkins OMIM database record ID 600192, and in cited publications listed in Table 5, which are hereby incorporated by reference.Suppression of tumorigenicity 5 (ST5, Accession NP_631896.1) is another GAM130 target gene, herein designated TARGET GENE. ST5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ST5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST5 BINDING SITE, designated SEQ ID:6346, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20901] Another function of GAM130 is therefore inhibition of Suppression of tumorigenicity 5 (ST5, Accession NP_631896.1), a gene which preferentially binds to the SH3 domain of c- Abl kinase, and acts as a regulator of MAPK1/ERK2 kinase. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with ST5.

[20902] The function of ST5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Suppression of tumorigenicity 5 (ST5, Accession NP_005409.2) is another GAM130 target gene, herein designated TARGET GENE. ST5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ST5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST5 BINDING SITE, designated SEQ ID:6346, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20903] Another function of GAM130 is therefore inhibition of Suppression of tumorigenicity 5 (ST5, Accession NP_005409.2), a gene which preferentially binds to the SH3 domain of c- Abl kinase, and acts as a regulator of MAPK1/ERK2 kinase. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST5.

[20904] The function of ST5 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Start domain containing 7 (STARD7, Accession NP_644672.1) is another GAM130 target gene, herein designated TARGET GENE. STARD7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STARD7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING SITE, designated SEQ ID:20092, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20905] Another function of GAM130 is therefore inhibition of Start domain containing 7 (STARD7, Accession NP_644672.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7.

[20906] Start domain containing 7 (STARD7, Accession NP_064536.1) is another GAM130 target gene, herein designated TARGET GENE. STARD7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STARD7, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING SITE, designated SEQ ID:20092, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20907] Another function of GAM130 is therefore inhibition of Start domain containing 7 (STARD7, Accession NP_064536.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7.

[20908] Staufen, rna binding protein (drosophila) (STAU, Accession NP_004593.1) is another GAM130 target gene, herein designated TARGET GENE. STAU BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by STAU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAU BINDING SITE, designated SEQ ID:7149, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20909] Another function of GAM130 is therefore inhibition of

Staufen, rna binding protein (drosophila) (STAU, Accession NP_004593.1), a gene which may play a role in specific positioning of mrnas at given sites in the cell and in stimulating their translation at the site. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU.

[20910] The function of STAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM37.1.Stomatin (STOM, Accession NP_004090.3) is another GAM130 target gene, herein designated TARGET GENE. STOM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STOM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STOM BINDING SITE, designated SEQ ID:11080, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20911] Another function of GAM130 is therefore inhibition of Stomatin (STOM, Accession NP_004090.3) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with STOM.

[20912] Synaptotagmin xi (SYT11, Accession NP_689493.2) is another GAM130 target gene, herein designated TARGET GENE. SYT11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYT11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYT11 BINDING SITE, designated SEQ ID:11259, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20913] Another function of GAM130 is therefore inhibition of Synaptotagmin xi (SYT11, Accession NP_689493.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT11.

[20914] Synaptotagmin xiii (SYT13, Accession NP_065877.1) is another GAM130 target gene, herein designated TARGET GENE. SYT13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYT13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of SYT13 BINDING SITE, designated SEQ ID:1756, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20915] Another function of GAM130 is therefore inhibition of Synaptotagmin xiii (SYT13, Accession NP_065877.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13.

[20916] Taf11 rna polymerase ii, tata box binding protein (tbp)-associated factor, 28kda (TAF11, Accession NP_005634.1) is another GAM130 target gene, herein designated TARGET GENE. TAF11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TAF11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAF11 BINDING SITE, designated SEQ ID:7353, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20917] Another function of GAM130 is therefore inhibition of Taf11 rna polymerase ii, tata box binding protein (tbp)-associated factor, 28kda (TAF11, Accession NP_005634.1), a gene which plays a central role in medi-

ating promoter responses to various activators and repressors. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF11.

[20918] The function of TAF11 has been established by previous studies. Mengus et al. (1995) immunopurified TFIID, separated the components by SDS- PAGE and transferred the bands to PVDF membrane for tryptic digestion, purified the resulting TAF peptides by reverse phase chromatography and subsequently obtained partial peptide sequence data. Degenerate oligomers of TAF2I (also referred to as TAFII28) were then used to screen a HeLa cell cDNA library. The TAFII28 cDNA encodes a 211- amino acid protein containing the expected tryptic peptides. It is about 50% identical to the Drosophila TAFII30- beta protein. The authors demonstrated that different domains of TAFII28 interact with TAFII18 (TAF2K; 600774) and TBP. Birck et al. (1998) determined the crystal structure of the human TBP- associated factor TAFII28/TAFII18 heterodimer and showed that these TAFIIs form a novel histone- like pair in the TFIID complex. The histone folds in TAFII28 and TAFII18 were not predicted from their primary sequence, indicating that these TAFIIs define a novel family of atypi-

cal histone fold sequences.

[20919]

[20920] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20921] Birck, C.; Poch, O.; Romier, C.; Ruff, M.; Mengus, G.; Lavigne, A.- C.; Davidson, I.; Moras, D. : Human TAFII28 and TAFII18 interact through a histone fold encoded by atypical evolutionary conserved motifs also found in the SPT3 family. Cell 94: 239- 249, 1998. ; and

[20922] Mengus, G.; May, M.; Jacq, X.; Staub, A.; Tora, L.; Chambon, P.; Davidson, I. : Cloning and characterization of hTAFII18, hTAFII20 and hTAFII28: three subunits of the human transcriptio.

[20923] Further studies establishing the function and utilities of TAF11 are found in John Hopkins OMIM database record ID 600772, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tbc1 domain family, member 5 (TBC1D5, Accession NP_055559.1) is another GAM130 target gene, herein designated TARGET GENE. TBC1D5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TBC1D5, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBC1D5 BINDING SITE, designated SEQ ID:14371, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20924] Another function of GAM130 is therefore inhibition of Tbc1 domain family, member 5 (TBC1D5, Accession NP_055559.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBC1D5.

[20925] TERA (Accession NP_067061.1) is another GAM130 target gene, herein designated TARGET GENE. TERA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TERA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:19045, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20926] Another function of GAM130 is therefore inhibition of TERA (Accession NP_067061.1) . Accordingly, utilities of

GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA.

[20927] TIM50L (Accession XP_053074.2) is another GAM130 target gene, herein designated TARGET GENE. TIM50L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIM50L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIM50L BINDING SITE, designated SEQ ID:18544, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20928] Another function of GAM130 is therefore inhibition of TIM50L (Accession XP_053074.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIM50L.

[20929] Tumor necrosis factor receptor superfamily, member 13c (TNFRSF13C, Accession NP_443177.1) is another GAM130 target gene, herein designated TARGET GENE. TNFRSF13C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFRSF13C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of TNFRSF13C BINDING SITE, designated SEQ ID:6834, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20930] Another function of GAM130 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 13c (TNFRSF13C, Accession NP_443177.1), a gene which is a regulator of the peripheral B- cell population. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF13C.

[20931] The function of TNFRSF13C has been established by previous studies. BAFF (TNFSF13B; 603969) enhances B- cell survival in vitro and is a regulator of the peripheral B- cell population. Overexpression of Baff in mice results in mature B- cell hyperplasia and symptoms of systemic lupus erythematosus (SLE; 152700) (Mackay et al., 1999). Likewise, some SLE patients have increased levels of BAFF in serum. Like APRIL (TNFSF13; 604472), BAFF binds to both TACI (OMIM Ref. No. 604907) and BCMA (TNFRSF17; 109545); however, mice deficient in these molecules maintain some B- cell function (Xu and Lam, 2001; Yan et al., 2001), suggesting the existence of a third BAFF recep-

tor. By screening an expression library of a B- cell line with undetectable BCMA and low TACI expression, Thompson et al. (2001) isolated a cDNA encoding the third BAFF receptor, BAFFR. Sequence analysis predicted that the 184- amino acid transmembrane protein is 56% identical to the mouse protein. TNF receptors typically contain multiple cysteine- rich domains (CRDs), each with 6 cys residues. BAFFR, however, has only 1 CRD that contains 4 extracellular cys residues. The C terminus of BAFFR has a conserved region of 25 consecutive amino acids that is probably involved in signal transduction. Northern blot analysis revealed expression of a 4.5- kb BAFFR transcript in spleen and lymph node, with lower levels in thymus and peripheral blood leukocytes. Binding analysis indicated that BAFFR binds human and mouse BAFF but no other TNF ligand, including APRIL. Soluble BAFFR inhibited BAFF- mediated costimulation of B- cell proliferation. Thompson et al. (2001) concluded that BAFFR is the principal receptor required for BAFF- mediated mature B- cell survival. Claudio et al. (2002) showed that bone marrow (BM) cells from Nfkb2 (OMIM Ref. No. 164012)- deficient mice, but not Nfkb1 (OMIM Ref. No. 164011)- deficient mice, failed to increase relative and

total IgD- positive transitional- 1 (T1) stage B cells in response to Baff. In vivo, however, Nfkb2- deficient mice did generate mature B cells, but at reduced numbers. Mice of the aly/aly strain, which are naturally deficient in Nik (OMIM Ref. No. 604655), and mice of the A/WySNJ strain, which have a mutation in Baffr, also failed to produce T1 B cells in response to Baff. Baff stimulation enhanced expression of Bcl2 (OMIM Ref. No. 151430) in T1 B cells, thereby promoting B- cell survival, and caused the processing of the p100 form of Nfkb2 to p52, which again required Baffr and Nik, but not Nemo (IKKG; 300248). Immunoblot analysis showed that BM cells contained primarily p100. In contrast, T1 splenic cells had higher levels of p52, and even higher amounts of p52 were found in T2/mature B- cell subsets. Claudio et al. (2002) concluded that through sustained exposure, BAFF activates NFKB in B cells primarily via processing of p100 and contributes to B- cell survival in vivo probably from the T1 stage onwards.

[20932] Animal model experiments lend further support to the function of TNFRSF13C. Using PCR, Thompson et al. (2001) determined that the A/WySnJ strain of mice, which resemble Baff knockout mice in their reduced number of

mature B cells, lack the intracellular signaling domain-encoding exon 3 of the Baffr gene. Flow cytometric analysis demonstrated that expression of the Baffr extracellular and transmembrane domains, which are encoded by exons 1 and 2, respectively, is maintained in this strain and that these cells are able to bind Baff.

[20933] It is appreciated that the abovementioned animal model for TNFRSF13C is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[20934] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20935] Claudio, E.; Brown, K.; Park, S.; Wang, H.; Siebenlist, U. : BAFF- induced NEMO- independent processing of NF-kappa- B2 in maturing B cells. Nature Immun. 3: 958-965, 2002. ; and

[20936] Thompson, J. S.; Bixler, S. A.; Qian, F.; Vora, K.; Scott, M. L.; Cachero, T. G.; Hession, C.; Schneider, P.; Sizing, I. D.; Mullen, C.; Strauch, K.; Zafari, M.; Benjamin, C. D.; Tschop.

[20937] Further studies establishing the function and utilities of TNFRSF13C are found in John Hopkins OMIM database record ID 606269, and in cited publications listed in Table

5, which are hereby incorporated by reference.Tumor protein p53 (li-fraumeni syndrome) (TP53, Accession NP_000537.2) is another GAM130 target gene, herein designated TARGET GENE. TP53 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TP53, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TP53 BINDING SITE, designated SEQ ID:3421, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20938] Another function of GAM130 is therefore inhibition of Tumor protein p53 (li-fraumeni syndrome) (TP53, Accession NP_000537.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53.

[20939] Thiopurine s-methyltransferase (TPMT, Accession NP_000358.1) is another GAM130 target gene, herein designated TARGET GENE. TPMT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TPMT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of TPMT BINDING SITE, designated SEQ ID:5228, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20940] Another function of GAM130 is therefore inhibition of Thiopurine s-methyltransferase (TPMT, Accession NP_000358.1), a gene which catalyzes the s- methylation of thiopurine drugs such as 6- mercaptopurine. and therefore may be associated with Thiopurine s- methyltransferase polymorphism. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Thiopurine s- methyltransferase polymorphism, and of other diseases and clinical conditions associated with TPMT.

[20941] The function of TPMT has been established by previous studies. Thiopurine S- methyltransferase (TPMT; S-adenosyl- L- methionine:thiopurine S- methyltransferase; EC 2.1.1.67) catalyzes thiopurine S- methylation, an important metabolic pathway for drugs such as 6- mercaptopurine. Weinshilboum and Sladek (1980) found trimodality for level of red cell TPMT among 298 randomly selected subjects: 88.6% had high enzyme activity; 11.1% had intermediate activity and 0.3% had undetectable activity. This distribution conforms to Hardy- Weinberg ex-

pectations for a pair of autosomal codominant alleles for low and high activity, TPMT- L and TPMT- H, with frequencies of 0.059 and 0.941, respectively. Segregation in families ascertained through probands with undetectable activity was consistent with this hypothesis. This genetic polymorphism may be an important factor in individual variations in sensitivity to thiopurines. 6- Mercaptopurine (6- MP) can be inactivated by S- methylation, which is catalyzed by thiopurine methyltransferase. An alternative metabolic route leads to the formation of cytotoxic 6-thioguanine nucleotides (6- TGN). Lennard et al. (1990) investigated whether these 2 pathways compete to affect the therapeutic response to 6- MP, by measuring 6- TGN concentrations and TPMT enzymatic activity in red cells of 95 children on long- term 6- MP therapy for acute lymphoblastic leukemia (ALL). Red cell TPMT activities were also measured in 130 control children and 104 long- term survivors of ALL no longer on treatment. In the children on 6- MP, red cell 6- TGN correlated negatively with red cell TPMT activity. Children with 6- TGN concentrations below the group mean had higher TPMT activities and a higher subsequent relapse rate. Fifty of the 104 long-term survivors had been treated with low- dose protocols;

this subgroup contained an excess of children with lower TPMT activities. The results indicated that genetically determined TPMT activity may be an important regulator of the cytotoxic effect of 6- MP, an effect which in turn may be important in influencing the outcome of therapy for childhood ALL. Klemetsdal et al. (1993) found in a group of healthy subjects that red blood cell TPMT activity was 8.3% higher in male subjects than in female subjects. Alves et al. (1999) applied a PCR- SSCP method for TPMT-specific detection which introduces a substantial technical simplification, avoiding the use of restriction enzyme treatment after PCR amplification. Additionally, the method allowed the simultaneous detection of a 474T- C transition, a frequent silent mutation in the non- Portuguese population (TPMT*1S = 0.215). In a sample of 310 unrelated Northern Portuguese individuals, 15 were found to be heterozygous for the TPMT*3A allele (187680.0002) which is associated with TPMT enzymatic deficiency; the corresponding gene frequency estimate was 0.024. In an attempt to evaluate the relationship between the molecular TPMT genotype and reaction to treatments involving thiopurine drugs, Alves et al. (1999) analyzed a sample of 24 children who received curative ther-

apy of acute lymphoblastic leukemia. Four of them were shown to be heterozygous for the TPMT*3A allele. An examination of their clinical histories showed that all 4 patients exhibited signs of severe hepatic toxicity during treatment. McLeod et al. (1999) studied the frequency of common TPMT variant alleles in 101 Kenyan individuals and 199 Caucasians. The frequency of mutant alleles was similar between the Caucasian (10.1%) and Kenyan (10.9%) populations; however, all mutant alleles in the Kenyan population were TPMT*3C (187680.0005) compared with 4.8% in Caucasians. In contrast, TPMT*3A (187680.0002) was the most common mutant allele in the Caucasian individuals.

[20942]

[20943] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20944] Alves, S.; Prata, M.- J.; Ferreira, F.; Amorim, A. : Thiopurine methyltransferase pharmacogenetics: alternative molecular diagnosis and preliminary data from Northern Portugal. Pharmacogenetics 9: 257- 261, 1999. ; and

[20945] Ameyaw, M.- M.; Collie- Duguid, E. S. R.; Powrie, R. H.; Ofori- Adjei, D.; McLeod, H. L. : Thiopurine methyltrans-

ferase alleles in British and Ghanaian populations. Hum. Molec. Genet. 8: 3.

[20946] Further studies establishing the function and utilities of TPMT are found in John Hopkins OMIM database record ID 187680, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tripartite motif-containing 5 (TRIM5, Accession NP_149023.1) is another GAM130 target gene, herein designated TARGET GENE. TRIM5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRIM5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM5 BINDING SITE, designated SEQ ID:4494, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20947] Another function of GAM130 is therefore inhibition of Tripartite motif-containing 5 (TRIM5, Accession NP_149023.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM5.

[20948] Transient receptor potential cation channel, subfamily m, member 6 (TRPM6, Accession NP_060132.3) is another

GAM130 target gene, herein designated TARGET GENE. TRPM6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:5183, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20949] Another function of GAM130 is therefore inhibition of Transient receptor potential cation channel, subfamily m, member 6 (TRPM6, Accession NP_060132.3), a gene which contains a predicted ion channel domain and a protein kinase domain. and therefore is associated with Hypomagnesemia with secondary hypocalcemia. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of Hypomagnesemia with secondary hypocalcemia, and of other diseases and clinical conditions associated with TRPM6.

[20950] The function of TRPM6 has been established by previous studies. Schlingmann et al. (2002) and Walder et al. (2002) studied hypomagnesemia with secondary hypocalcemia (HSH; 602014), which maps to 9q22, and by positional

cloning identified the TRPM6 gene as the site of causative mutations. Walder et al. (2002) found that the complete cDNA sequence of TRPM6 contains 8,429 nucleotides, including an open reading frame of 6,069 nucleotides. The predicted TRPM6 protein contains 2,022 amino acids, has a calculated molecular mass of roughly 234 kD, and contains a predicted ion channel domain and a protein kinase domain. Northern blot analysis detected an 8.5- kb transcript abundantly expressed in kidney and colon. By in situ hybridization to various human tissues, Schlingmann et al. (2002) observed TRPM6 mRNA in colon epithelial cells, duodenum, jejunum, and ileum. Schlingmann et al. (2002) studied 5 families (2 Turkish, 1 Swedish, 1 Israeli, and 1 Albanian) with typical HSH and discovered 7 mutations in the TRPM6 gene; the Swedish and Israeli families were nonconsanguineous and the affected children were compound heterozygotes for TRPM6 mutations. The age at onset of symptoms varied from 3 weeks to 4 months. Neurologic symptoms included tetany, muscle spasms, and seizures due to hypomagnesemic hypocalcemia. Walder et al. (2002) identified mutations in the TRPM6 gene in 7 families: 3 Bedouin Arab families from Israel, 1 Arab family from Greece, a family in Germany, and 2 addi-

tional Arab families from Israel. This was the first case of a human disorder attributed to mutation in a channel kinase.

[20951]

[20952] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20953] Walder, R. Y.; Landau, D.; Meyer, P.; Shalev, H.; Tsolia, M.; Borochowitz, Z.; Boettger, M. B.; Beck, G. E.; Englehardt, R. K.; Carmi, R.; Sheffield, V. C. : Mutation of TRPM6 causes familial hypomagnesemia with secondary hypocalcemia. Nature Genet. 31: 171- 174, 2002. ; and

[20954] Schlingmann, K. P.; Weber, S.; Peters, M.; Nejsum, L. N.; Vitzthum, H.; Klingel, K.; Kratz, M.; Haddad, E.; Ristoff, E.; Dinour, D.; Syrrou, M.; Nielsen, S.; Sassen, M.; Waldegger, S.; S.

[20955] Further studies establishing the function and utilities of TRPM6 are found in John Hopkins OMIM database record ID 607009, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transient receptor potential cation channel, subfamily v, member 1 (TRPV1, Accession NP_542436.1) is another GAM130 target gene, herein designated TARGET GENE. TRPV1 BIND-

ING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRPV1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE, designated SEQ ID:14336, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20956] Another function of GAM130 is therefore inhibition of Transient receptor potential cation channel, subfamily v, member 1 (TRPV1, Accession NP_542436.1), a gene which functions as a receptor for capsaicin. Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1.

[20957] The function of TRPV1 has been established by previous studies. Chuang et al. (2001) demonstrated that bradykinin- or NGF- mediated potentiation of thermal sensitivity in vivo requires expression of VR1, a heat- activated ion channel on sensory neurons. Diminution of plasma membrane phosphatidylinositol- 4,5,bisphosphate levels through antibody sequestration or PLC- mediated hydrolysis mimics the potentiating effects of bradykinin or

NGF at the cellular level. Moreover, recruitment of PLC-gamma (OMIM Ref. No. 172420) to TRK- alpha (OMIM Ref. No. 191315) is essential for NGF- mediated potentiation of channel activity, and biochemical studies suggested that VR1 associates with this complex. Chuang et al. (2001) concluded that their studies delineate a biochemical mechanism through which bradykinin and NGF produce hypersensitivity and might explain how the activation of PLC signaling systems regulates other members of the TRP channel family.

[20958] Animal model experiments lend further support to the function of TRPV1. Caterina et al. (2000) generated mice deficient in VR1 by targeted disruption. VR1 - /- mice were viable, fertile, and largely indistinguishable from wildtype littermates. Caterina et al. (2000) demonstrated that sensory neurons from mice lacking VR1 are severely deficient in their responses to vanilloid compounds, protons, or heat greater than 43 degrees C. VR1 - /- mice showed normal responses to noxious mechanical stimuli but exhibited no vanilloid- evoked pain behavior, were impaired in the detection of painful heat, and showed little thermal hypersensitivity in the setting of inflammation. Thus, Caterina et al. (2000) concluded that VR1 is essen-

tial for selective modalities of pain sensation and for tissue injury- induced thermal hyperalgesia.

[20959] It is appreciated that the abovementioned animal model for TRPV1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

sensation in m.

[20987] Further studies establishing the function and utilities of TRPV1 are found in John Hopkins OMIM database record ID 602076, and in cited publications listed in Table 5, which are hereby incorporated by reference.TU12B1-TY (Accession NP_057659.1) is another GAM130 target gene, herein designated TARGET GENE. TU12B1-TY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TU12B1-TY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:18545, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20988] Another function of GAM130 is therefore inhibition of TU12B1-TY (Accession NP_057659.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY.

[20989] Ubiquitin protein ligase e3a (human papilloma virus e6-associated protein, angelman syndrome) (UBE3A, Accession NP_570853.1) is another GAM130 target gene,

herein designated TARGET GENE. UBE3A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE3A BINDING SITE, designated SEQ ID:11737, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20990] Another function of GAM130 is therefore inhibition of Ubiquitin protein ligase e3a (human papilloma virus e6-associated protein, angelman syndrome) (UBE3A, Accession NP_570853.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A.

[20991] Ubiquitin protein ligase e3a (human papilloma virus e6-associated protein, angelman syndrome) (UBE3A, Accession NP_000453.2) is another GAM130 target gene, herein designated TARGET GENE. UBE3A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of UBE3A BINDING SITE, designated SEQ ID:11737, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20992] Another function of GAM130 is therefore inhibition of Ubiquitin protein ligase e3a (human papilloma virus e6-associated protein, angelman syndrome) (UBE3A, Accession NP_000453.2) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A.

[20993] Ubiquitin protein ligase e3a (human papilloma virus e6-associated protein, angelman syndrome) (UBE3A, Accession NP_570854.1) is another GAM130 target gene, herein designated TARGET GENE. UBE3A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE3A BINDING SITE, designated SEQ ID:11737, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20994] Another function of GAM130 is therefore inhibition of

Ubiquitin protein ligase e3a (human papilloma virus e6-associated protein, angelman syndrome) (UBE3A, Accession NP_570854.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A.

[20995] VIK (Accession NP_612503.1) is another GAM130 target gene, herein designated TARGET GENE. VIK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by VIK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VIK BINDING SITE, designated SEQ ID:1104, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20996] Another function of GAM130 is therefore inhibition of VIK (Accession NP_612503.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIK.

[20997] Vesicle transport through interaction with t-snares homolog 1a (yeast) (VTI1A, Accession NP_660207.1) is another GAM130 target gene, herein designated TARGET GENE. VTI1A BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by VTI1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VTI1A BINDING SITE, designated SEQ ID:1804, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[20998] Another function of GAM130 is therefore inhibition of Vesicle transport through interaction with t-snares homolog 1a (yeast) (VTI1A, Accession NP_660207.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VTI1A.

[20999] Zinc finger protein 253 (ZNF253, Accession NP_066385.1) is another GAM130 target gene, herein designated TARGET GENE. ZNF253 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF253, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF253 BINDING SITE, designated SEQ ID:6640, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[21000] Another function of GAM130 is therefore inhibition of Zinc finger protein 253 (ZNF253, Accession NP_066385.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF253.

[21001] Zinc finger protein 273 (ZNF273, Accession XP_088082.1) is another GAM130 target gene, herein designated TARGET GENE. ZNF273 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF273, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF273 BINDING SITE, designated SEQ ID:16028, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[21002] Another function of GAM130 is therefore inhibition of Zinc finger protein 273 (ZNF273, Accession XP_088082.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF273.

[21003] ZNF432 (Accession NP_055465.1) is another GAM130 target gene, herein designated TARGET GENE. ZNF432 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF432, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF432 BINDING SITE, designated SEQ ID:4119, to the nucleotide sequence of GAM130 RNA, herein designated GAM RNA, also designated SEQ ID:331.

[21004] Another function of GAM130 is therefore inhibition of ZNF432 (Accession NP_055465.1) . Accordingly, utilities of GAM130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF432.

[21005]

[21006] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 131 (GAM131), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21007] GAM131 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM131 was detected is described hereinabove

with reference to Figs. 8-15.

[21008] GAM131 gene, herein designated GAM GENE, and GAM131 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[21009] GAM131 gene encodes a GAM131 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM131 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM131 precursor RNA is designated SEQ ID:170, and is provided hereinbelow with reference to the sequence listing part.

[21010] GAM131 precursor RNA folds onto itself, forming GAM131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21011] GAM131 precursor RNA folds onto itself, forming GAM131 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[21012] Nucleotide sequence of GAM131 precursor RNA, designated SEQ-ID: 170, and a schematic representation of a predicted secondary folding of GAM131 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[21013] An enzyme complex designated DICER COMPLEX, `dices` the GAM131 folded precursor RNA into GAM131 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM131 RNA is designated SEQ ID:313, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby in-

corporated by reference.

[21014] GAM131 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM131 target RNA, herein designated GAM TARGET RNA. GAM131 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21015] GAM131 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM131 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM131 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM131 RNA may have a different number of target binding sites in untranslated regions of a GAM131 target RNA. It is further appreciated that while Fig. 8 depicts tar-

get binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21016] The complementary binding of GAM131 RNA, herein designated GAM RNA, to target binding sites on GAM131 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM131 target RNA into GAM131 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21017] It is appreciated that GAM131 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM131 target genes. The mRNA of each one of this plurality of GAM131 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM131 RNA, herein designated GAM RNA, and which when bound by GAM131 RNA causes inhibition of translation of respective one or more GAM131 target proteins.

[21018] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by

GAM131 gene, herein designated GAM GENE, on one or more GAM131 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21019] It is appreciated that specific functions and accordingly utilities of GAM131 correlate with, and may be deduced from, the identity of the target genes which GAM131 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21020]

[21021]

[21022] ASK (Accession NM_006716.1) is a GAM131 target gene, herein designated TARGET GENE. ASK BINDING SITE is a

target binding site found in the 5` untranslated region of mRNA encoded by ASK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASK BINDING SITE, designated SEQ ID:7247, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21023] A function of GAM131 is therefore inhibition of ASK (Accession NM_006716.1) . Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASK.

[21024] Atpase, class i, type 8b, member 2 (ATP8B2, Accession XM_290875.1) is another GAM131 target gene, herein designated TARGET GENE. ATP8B2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ATP8B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:13187, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21025] Another function of GAM131 is therefore inhibition of At-

pase, class i, type 8b, member 2 (ATP8B2, Accession XM_290875.1) . Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2.

[21026] LGP1 (Accession NM_032484.2) is another GAM131 target gene, herein designated TARGET GENE. LGP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LGP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGP1 BINDING SITE, designated SEQ ID:18541, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21027] Another function of GAM131 is therefore inhibition of LGP1 (Accession NM_032484.2) . Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGP1.

[21028] LHX6 (Accession NM_014368.1) is another GAM131 target gene, herein designated TARGET GENE. LHX6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LHX6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LHX6 BINDING SITE, designated SEQ ID:7257, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21029] Another function of GAM131 is therefore inhibition of LHX6 (Accession NM_014368.1) . Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX6.

[21030] LOC143162 (Accession) is another GAM131 target gene, herein designated TARGET GENE. LOC143162 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143162, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143162 BINDING SITE, designated SEQ ID:7765, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21031] Another function of GAM131 is therefore inhibition of LOC143162 (Accession) . Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143162.

[21032] LOC145123 (Accession) is another GAM131 target gene, herein designated TARGET GENE. LOC145123 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145123 BINDING SITE, designated SEQ ID:15702, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21033] Another function of GAM131 is therefore inhibition of LOC145123 (Accession) . Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145123.

[21034] LOC146990 (Accession XM_097149.2) is another GAM131 target gene, herein designated TARGET GENE. LOC146990 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146990, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC146990 BINDING SITE, designated SEQ ID:17527, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21035] Another function of GAM131 is therefore inhibition of LOC146990 (Accession XM_097149.2) . Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146990.

[21036] Prothymosin, alpha (gene sequence 28) (PTMA, Accession NM_002823.2) is another GAM131 target gene, herein designated TARGET GENE. PTMA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTMA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTMA BINDING SITE, designated SEQ ID:19917, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21037] Another function of GAM131 is therefore inhibition of Prothymosin, alpha (gene sequence 28) (PTMA, Accession NM_002823.2), a gene which may mediate immune function by conferring resistance to certain opportunistic in-

fections. Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMA.

[21038] The function of PTMA has been established by previous studies. The thymus gland produces several hormones or hormone- like substances which are derived from a polypeptide precursor containing (in the rat) 113 amino acids and known as prothymosin- alpha. A peptide containing 28 amino acid residues, named thymosin- alpha-1, was originally isolated from calf thymosin fraction 5 and shown to restore various aspects of immune function in several in vitro and in vivo test systems. Thymosin- alpha- 1 was subsequently isolated from a similar fraction from human thymosin and reported to have the same amino acid sequence as bovine thymosin- alpha- 1. Haritos et al. (1984) isolated from fresh rat thymus a larger polypeptide named prothymosin- alpha, which contains the thymosin- alpha- 1 sequence at its NH2 terminus. Prothymosin- alpha has also been isolated from human thymus. Goodall et al. (1986) constructed a cDNA library from human spleen mRNA and screened for clones containing cDNAs coding for prothymosin- alpha. Eschenfeldt and Berger (1986) identified cDNA clones for human pro-

thymosin- alpha in cDNA libraries from staphylococcal endotoxin A- stimulated normal human lymphocytes. The encoded protein was found to be highly acidic (54 residues out of 111) and shared over 90% sequence homology with rat prothymosin- alpha. The peptide hormone thymosin- alpha- 1 appeared at positions 2- 29 of the prothymosin- alpha amino acid sequence. Manrow et al. (1992) concluded that of the 6 members of the prothymosin- alpha gene family that have been cloned and sequenced, only one is functional. Szabo et al. (1993) isolated a genomic clone encoding PTMA and subcloned and sequenced the 5- prime regulatory region. They used the 5- prime flanking cloned probe to localize the prothymosin gene to human chromosome 2 by Southern analysis of somatic cell hybrids.

[21039]

[21040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21041] Haritos, A. A.; Goodall, G. J.; Horecker, B. L. : Prothymosin alpha: isolation and properties of the major immunoreactive form of thymosin alpha- 1 in rat thymus. Proc. Nat. Acad. Sci. 81: 1008- 1011, 1984. ; and

[21042] Manrow, R. E.; Leone, A.; Krug, M. S.; Eschenfeldt, W. H.; Berger, S. L. : The human prothymosin alpha gene family contains several processed pseudogenes lacking deleterious lesions. Ge.

[21043] Further studies establishing the function and utilities of PTMA are found in John Hopkins OMIM database record ID 188390, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transforming growth factor, alpha (TGFA, Accession NM_003236.1) is another GAM131 target gene, herein designated TARGET GENE. TGFA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:3907, to the nucleotide sequence of GAM131 RNA, herein designated GAM RNA, also designated SEQ ID:313.

[21044] Another function of GAM131 is therefore inhibition of Transforming growth factor, alpha (TGFA, Accession NM_003236.1), a gene which is able to bind to the egf receptor and to act synergistically with tgf beta to promote anchorage- independent cell proliferation in soft agar.

Accordingly, utilities of GAM131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA.

[21045] The function of TGFA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.

[21046] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 132 (GAM132), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21047] GAM132 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM132 was detected is described hereinabove with reference to Figs. 8-15.

[21048] GAM132 gene, herein designated GAM GENE, and GAM132 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[21049] GAM132 gene encodes a GAM132 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM132 precur-

sor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM132 precursor RNA is designated SEQ ID:114, and is provided hereinbelow with reference to the sequence listing part.

[21050] GAM132 precursor RNA folds onto itself, forming GAM132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21051] GAM132 precursor RNA folds onto itself, forming GAM132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[21052] Nucleotide sequence of GAM132 precursor RNA, designated SEQ-ID: 114, and a schematic representation of a predicted secondary folding of GAM132 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[21053] An enzyme complex designated DICER COMPLEX, `dices` the GAM132 folded precursor RNA into GAM132 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM132 RNA is designated SEQ ID:369, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[21054] GAM132 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM132 target RNA, herein designated GAM TARGET RNA. GAM132 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[21055] GAM132 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM132 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM132 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM132 RNA may have a different number of target binding sites in untranslated regions of a GAM132 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21056] The complementary binding of GAM132 RNA, herein designated GAM RNA, to target binding sites on GAM132 target RNA, herein designated GAM TARGET RNA, such as

BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM132 target RNA into GAM132 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21057] It is appreciated that GAM132 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM132 target genes. The mRNA of each one of this plurality of GAM132 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM132 RNA, herein designated GAM RNA, and which when bound by GAM132 RNA causes inhibition of translation of respective one or more GAM132 target proteins.

[21058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM132 gene, herein designated GAM GENE, on one or more GAM132 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21059] It is appreciated that specific functions and accordingly utilities of GAM132 correlate with, and may be deduced from, the identity of the target genes which GAM132 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21060]

[21061]

[21062] Chloride intracellular channel 5 (CLIC5, Accession NM_016929.1) is a GAM132 target gene, herein designated TARGET GENE. CLIC5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLIC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLIC5 BINDING SITE, designated SEQ ID:17752, to the nucleotide sequence of GAM132

RNA, herein designated GAM RNA, also designated SEQ ID:369.

[21063] A function of GAM132 is therefore inhibition of Chloride intracellular channel 5 (CLIC5, Accession NM_016929.1) . Accordingly, utilities of GAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC5.

[21064] FLJ10377 (Accession NM_018077.1) is another GAM132 target gene, herein designated TARGET GENE. FLJ10377 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10377, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10377 BINDING SITE, designated SEQ ID:929, to the nucleotide sequence of GAM132 RNA, herein designated GAM RNA, also designated SEQ ID:369.

[21065] Another function of GAM132 is therefore inhibition of FLJ10377 (Accession NM_018077.1) . Accordingly, utilities of GAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10377.

[21066] Paired box gene 2 (PAX2, Accession NM_003987.1) is an-

other GAM132 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:16012, to the nucleotide sequence of GAM132 RNA, herein designated GAM RNA, also designated SEQ ID:369.

[21067] Another function of GAM132 is therefore inhibition of Paired box gene 2 (PAX2, Accession NM_003987.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM132 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[21068] The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily e, member 1

(SMARCE1, Accession NM_003079.3) is another GAM132 target gene, herein designated TARGET GENE. SMARCE1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMARCE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCE1 BINDING SITE, designated SEQ ID:3854, to the nucleotide sequence of GAM132 RNA, herein designated GAM RNA, also designated SEQ ID:369.

[21069] Another function of GAM132 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily e, member 1 (SMARCE1, Accession NM_003079.3) . Accordingly, utilities of GAM132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCE1.

[21070]

[21071] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 133 (GAM133), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21072] GAM133 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM133 was detected is described hereinabove with reference to Figs. 8-15.

[21073] GAM133 gene, herein designated GAM GENE, and GAM133 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[21074] GAM133 gene encodes a GAM133 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM133 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM133 precursor RNA is designated SEQ ID:88, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:88 is located at position 148414074 relative to chromosome 3.

[21075] GAM133 precursor RNA folds onto itself, forming GAM133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21076] GAM133 precursor RNA folds onto itself, forming GAM133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[21077] Nucleotide sequence of GAM133 precursor RNA, designated SEQ-ID: 88, and a schematic representation of a predicted secondary folding of GAM133 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[21078] An enzyme complex designated DICER COMPLEX, `dices` the GAM133 folded precursor RNA into GAM133 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM133 RNA is designated SEQ ID:211, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[21079] GAM133 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM133 target RNA, herein designated GAM TARGET RNA. GAM133 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21080] GAM133 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM133 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM133 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is

meant as an illustration only, and is not meant to be limiting GAM133 RNA may have a different number of target binding sites in untranslated regions of a GAM133 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21081] The complementary binding of GAM133 RNA, herein designated GAM RNA, to target binding sites on GAM133 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM133 target RNA into GAM133 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21082] It is appreciated that GAM133 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM133 target genes. The mRNA of each one of this plurality of GAM133 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM133 RNA, herein designated GAM RNA, and which when bound by GAM133 RNA causes inhibition of translation of respective

one or more GAM133 target proteins.

[21083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM133 gene, herein designated GAM GENE, on one or more GAM133 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21084] It is appreciated that specific functions and accordingly utilities of GAM133 correlate with, and may be deduced from, the identity of the target genes which GAM133 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21085]

[21086]

[21087] Afg3 atpase family gene 3-like 1 (yeast) (AFG3L1, Accession NP_001123.1) is a GAM133 target gene, herein designated TARGET GENE. AFG3L1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AFG3L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AFG3L1 BINDING SITE, designated SEQ ID:18205, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21088] A function of GAM133 is therefore inhibition of Afg3 atpase family gene 3-like 1 (yeast) (AFG3L1, Accession NP_001123.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFG3L1.

[21089] ARPP-21 (Accession NP_057384.1) is another GAM133 target gene, herein designated TARGET GENE. ARPP-21 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ARPP-21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of ARPP-21 BINDING SITE, designated SEQ ID:4699, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21090] Another function of GAM133 is therefore inhibition of ARPP-21 (Accession NP_057384.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-21.

[21091] Bcl2-like 2 (BCL2L2, Accession NP_004041.1) is another GAM133 target gene, herein designated TARGET GENE. BCL2L2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BCL2L2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:19697, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21092] Another function of GAM133 is therefore inhibition of Bcl2-like 2 (BCL2L2, Accession NP_004041.1), a gene which promotes cell survival. Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with BCL2L2.

[21093] The function of BCL2L2 has been established by previous studies. Gibson et al. (1996) used degenerate PCR to clone a novel BCL2 homolog which they denoted BCLW. The gene encodes a 193- amino acid polypeptide. Gibson et al. (1996) also isolated the mouse BCLW gene; its amino acid sequence is 99% identical to that of the human gene. Mouse BCLW is expressed as a 3.7- kb mRNA in a variety of tissues, with highest expression in brain, colon, and salivary gland. In mouse hematopoietic cell lines, BCLW is expressed in myeloid cells and to a lesser extent in lymphoid cells. Like BCL2, expressed BCLW promotes cell survival under a variety of cytotoxic conditions. Gibson et al. (1996) used fluorescence in situ hybridization to map the BCLW gene to human chromosome 14q11.2- q12.

[21094] Animal model experiments lend further support to the function of BCL2L2. To identify genes required for mammalian spermatogenesis, Ross et al. (1998) screened lines of mutant mice created using a retroviral gene- trap system for male infertility. Homozygous ROSA41 male mice exhibited sterility associated with progressive testicular degeneration. Germ cell defects were first observed at 19 days postnatal. Spermatogenesis was blocked during late

spermiogenesis in young adults. Gradual depletion of all stages of germ cells resulted in a Sertoli- cell- only phenotype by approximately 6 months of age. Subsequently, almost all Sertoli cells were lost from the seminiferous tubules, and the Leydig cell population was reduced. Molecular analysis indicated that the gene mutated in these mice is BCLW, a death- protecting member of the Bcl2 family. The mutant allele of Bclw in ROSA41 did not produce a Bclw polypeptide. Expression of Bclw in the testis appeared to be restricted to elongating spermatids and Sertoli cells.

[21095] It is appreciated that the abovementioned animal model for BCL2L2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[21096] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21097] Gibson, L.; Holmgreen, S. P.; Huang, D. C. S.; Bernard, O.; Copeland, N. G.; Jenkins, N. A.; Sutherland, G. R.; Baker, E.; Adams, J. M.; Cory, S. : bcl- w, a novel member of the bcl- 2 family, promotes cell survival. Oncogene 13: 665-675, 1996. ; and

[21098] Ross, A. J.; Waymire, K. G.; Moss, J. E.; Parlow, A. F.; Skinner, M. K.; Russell, L. D.; MacGregor, G. R. : Testicular degeneration in Bclw- deficient mice. Nature Genet. 18: 251- 256, 199.

[21099] Further studies establishing the function and utilities of BCL2L2 are found in John Hopkins OMIM database record ID 601931, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome 5 open reading frame 7 (C5orf7, Accession NP_057688.1) is another GAM133 target gene, herein designated TARGET GENE. C5orf7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C5orf7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf7 BINDING SITE, designated SEQ ID:10526, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21100] Another function of GAM133 is therefore inhibition of Chromosome 5 open reading frame 7 (C5orf7, Accession NP_057688.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with C5orf7.

[21101] CD109 (Accession NP_598000.1) is another GAM133 target gene, herein designated TARGET GENE. CD109 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD109, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD109 BINDING SITE, designated SEQ ID:15628, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21102] Another function of GAM133 is therefore inhibition of CD109 (Accession NP_598000.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD109.

[21103] Cd72 antigen (CD72, Accession NP_001773.1) is another GAM133 target gene, herein designated TARGET GENE. CD72 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD72, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD72 BINDING SITE, designated SEQ ID:3671, to the nu-

cleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21104] Another function of GAM133 is therefore inhibition of Cd72 antigen (CD72, Accession NP_001773.1), a gene which may be involved in signals for B- cell proliferation. Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD72.

[21105] The function of CD72 has been established by previous studies. By means of monoclonal antibodies, Von Hoegen et al. (1991) demonstrated identity of CD72 to the human homolog of mouse Lyb2 and localized the gene to the short arm of human chromosome 9 by study of mouse/human somatic cell hybrids. The mouse Lyb2 gene had previously been mapped to chromosome 4. Expression of Lyb2 is restricted to B- lineage cells and is turned off in antibody- secreting plasma cells in both mice and humans. The protein may be involved in signals for B- cell proliferation. In a review of immune inhibitory receptors, Ravetch and Lanier (2000) pointed out that autoimmune disorders may result from the disruption of inhibitory receptors, particularly in their conserved intracellular immunoreceptor tyrosine- based inhibitory motifs (ITIMs).

ITIMs are sites for alternative phosphorylation, typically by a Src kinase, and dephosphorylation, either by the tyrosine phosphatase SHP1 (OMIM Ref. No. 176883) or the inositol phosphatase SHIP (OMIM Ref. No. 601582), transducing signals to distinct pathways. B cells from CD72-deficient mice are hyperresponsive to lipopolysaccharide stimulation and B cell receptor aggregation

[21106] Animal model experiments lend further support to the function of CD72. Using a mouse model, Kumanogoh et al. (2000) determined that the CD100 (SEMA4D; 601866) receptor plexin B1 (PLXNB1; 601053) is not detectable in lymphocytes, and that in the immune system, CD72 appears to be the receptor for CD100.

[21107] It is appreciated that the abovementioned animal model for CD72 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[21108] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21109] Von Hoegen, I.; Hsieh, C.- L.; Scharting, R.; Francke, U.; Parnes, J. R. : Identity of human Lyb- 2 and CD72 and localization of the gene to chromosome 9. Europ. J. Immun.

21: 1425- 1431, 1991. ; and

[21110] Ravetch, J. V.; Lanier, L. L. : Immune inhibitory receptors. Science 290: 84- 89, 2000.

[21111] Further studies establishing the function and utilities of CD72 are found in John Hopkins OMIM database record ID 107272, and in cited publications listed in Table 5, which are hereby incorporated by reference.CGI-69 (Accession NP_057100.1) is another GAM133 target gene, herein designated TARGET GENE. CGI-69 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CGI-69, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-69 BINDING SITE, designated SEQ ID:11572, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21112] Another function of GAM133 is therefore inhibition of CGI-69 (Accession NP_057100.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-69.

[21113] CYP24A1 (Accession NP_000773.1) is another GAM133 target gene, herein designated TARGET GENE. CYP24A1

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CYP24A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP24A1 BINDING SITE, designated SEQ ID:6890, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21114] Another function of GAM133 is therefore inhibition of CYP24A1 (Accession NP_000773.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP24A1.

[21115] DKFZp434F1719 (Accession NP_115624.1) is another GAM133 target gene, herein designated TARGET GENE. DKFZp434F1719 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434F1719, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434F1719 BINDING SITE, designated SEQ ID:11319, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:211.

[21116] Another function of GAM133 is therefore inhibition of DKFZp434F1719 (Accession NP_115624.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F1719.

[21117] DKFZp667M2411 (Accession XP_290795.1) is another GAM133 target gene, herein designated TARGET GENE. DKFZp667M2411 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp667M2411, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667M2411 BINDING SITE, designated SEQ ID:10447, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21118] Another function of GAM133 is therefore inhibition of DKFZp667M2411 (Accession XP_290795.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667M2411.

[21119] DKFZp761H2121 (Accession NP_612212.1) is another

GAM133 target gene, herein designated TARGET GENE. DKFZp761H2121 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761H2121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761H2121 BINDING SITE, designated SEQ ID:9664, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21120] Another function of GAM133 is therefore inhibition of DKFZp761H2121 (Accession NP_612212.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H2121.

[21121] DKFZp761L1417 (Accession NP_690877.1) is another GAM133 target gene, herein designated TARGET GENE. DKFZp761L1417 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761L1417, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761L1417 BINDING SITE,

designated SEQ ID:2227, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21122] Another function of GAM133 is therefore inhibition of DKFZp761L1417 (Accession NP_690877.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761L1417.

[21123] Epiregulin (EREG, Accession NP_001423.1) is another GAM133 target gene, herein designated TARGET GENE. EREG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EREG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EREG BINDING SITE, designated SEQ ID:11651, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21124] Another function of GAM133 is therefore inhibition of Epiregulin (EREG, Accession NP_001423.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EREG.

[21125] EXO70 (Accession NP_056034.1) is another GAM133 target gene, herein designated TARGET GENE. EXO70 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EXO70, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EXO70 BINDING SITE, designated SEQ ID:4489, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21126] Another function of GAM133 is therefore inhibition of EXO70 (Accession NP_056034.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXO70.

[21127] Fat tumor suppressor homolog 2 (drosophila) (FAT2, Accession NP_001438.1) is another GAM133 target gene, herein designated TARGET GENE. FAT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FAT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FAT2 BINDING SITE, designated SEQ ID:12813, to the nucleotide sequence of

GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21128] Another function of GAM133 is therefore inhibition of Fat tumor suppressor homolog 2 (drosophila) (FAT2, Accession NP_001438.1), a gene which could function as a cell-adhesion protein. Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT2.

[21129] The function of FAT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.1.Fk506 binding protein like (FKBPL, Accession NP_071393.2) is another GAM133 target gene, herein designated TARGET GENE. FKBPL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FKBPL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBPL BINDING SITE, designated SEQ ID:12297, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21130] Another function of GAM133 is therefore inhibition of

Fk506 binding protein like (FKBPL, Accession NP_071393.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBPL.

[21131] FLJ10120 (Accession NP_060471.1) is another GAM133 target gene, herein designated TARGET GENE. FLJ10120 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10120, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10120 BINDING SITE, designated SEQ ID:10447, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21132] Another function of GAM133 is therefore inhibition of FLJ10120 (Accession NP_060471.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10120.

[21133] FLJ10159 (Accession NP_060483.1) is another GAM133 target gene, herein designated TARGET GENE. FLJ10159 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10159, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10159 BINDING SITE, designated SEQ ID:2393, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21134] Another function of GAM133 is therefore inhibition of FLJ10159 (Accession NP_060483.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10159.

[21135] FLJ12541 (Accession NP_071764.2) is another GAM133 target gene, herein designated TARGET GENE. FLJ12541 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12541, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12541 BINDING SITE, designated SEQ ID:2066, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21136] Another function of GAM133 is therefore inhibition of FLJ12541 (Accession NP_071764.2) . Accordingly, utilities

of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12541.

[21137] FLJ12644 (Accession NP_075562.2) is another GAM133 target gene, herein designated TARGET GENE. FLJ12644 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12644, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12644 BINDING SITE, designated SEQ ID:7228, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21138] Another function of GAM133 is therefore inhibition of FLJ12644 (Accession NP_075562.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12644.

[21139] FLJ12750 (Accession NP_078943.1) is another GAM133 target gene, herein designated TARGET GENE. FLJ12750 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12750, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12750 BINDING SITE, designated SEQ ID:3004, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21140] Another function of GAM133 is therefore inhibition of FLJ12750 (Accession NP_078943.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12750.

[21141] FLJ20281 (Accession NP_060212.1) is another GAM133 target gene, herein designated TARGET GENE. FLJ20281 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ20281, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20281 BINDING SITE, designated SEQ ID:5478, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21142] Another function of GAM133 is therefore inhibition of FLJ20281 (Accession NP_060212.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20281.

[21143] FLJ20716 (Accession NP_060408.2) is another GAM133 target gene, herein designated TARGET GENE. FLJ20716 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20716, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20716 BINDING SITE, designated SEQ ID:13390, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21144] Another function of GAM133 is therefore inhibition of FLJ20716 (Accession NP_060408.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20716.

[21145] FLJ21673 (Accession NP_112160.1) is another GAM133 target gene, herein designated TARGET GENE. FLJ21673 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ21673 BINDING SITE, designated SEQ ID:18661, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21146] Another function of GAM133 is therefore inhibition of FLJ21673 (Accession NP_112160.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21673.

[21147] FLJ25067 (Accession NP_689717.2) is another GAM133 target gene, herein designated TARGET GENE. FLJ25067 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25067, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25067 BINDING SITE, designated SEQ ID:8347, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21148] Another function of GAM133 is therefore inhibition of FLJ25067 (Accession NP_689717.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ25067.

[21149] FLJ31166 (Accession NP_694567.1) is another GAM133 target gene, herein designated TARGET GENE. FLJ31166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31166 BINDING SITE, designated SEQ ID:2122, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21150] Another function of GAM133 is therefore inhibition of FLJ31166 (Accession NP_694567.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31166.

[21151] FLJ32069 (Accession NP_694578.1) is another GAM133 target gene, herein designated TARGET GENE. FLJ32069 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32069, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ32069 BINDING SITE, designated SEQ ID:7828, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21152] Another function of GAM133 is therefore inhibition of FLJ32069 (Accession NP_694578.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32069.

[21153] FLJ32919 (Accession NP_653189.2) is another GAM133 target gene, herein designated TARGET GENE. FLJ32919 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32919, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32919 BINDING SITE, designated SEQ ID:1007, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21154] Another function of GAM133 is therefore inhibition of FLJ32919 (Accession NP_653189.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32919.

[21155] Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NP_000139.1) is another GAM133 target gene, herein designated TARGET GENE. FUT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT1 BINDING SITE, designated SEQ ID:5184, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21156] Another function of GAM133 is therefore inhibition of Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NP_000139.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT1.

[21157] Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 10 (galnac-t10) (GALNT10, Accession NP_060010.2) is another GAM133 target gene, herein designated TARGET GENE. GALNT10

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GALNT10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALNT10 BINDING SITE, designated SEQ ID:16339, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21158] Another function of GAM133 is therefore inhibition of Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 10 (galnac-t10) (GALNT10, Accession NP_060010.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT10.

[21159] Guanine nucleotide binding protein (g protein), gamma 11 (GNG11, Accession NP_004117.1) is another GAM133 target gene, herein designated TARGET GENE. GNG11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GNG11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNG11

BINDING SITE, designated SEQ ID:1974, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21160] Another function of GAM133 is therefore inhibition of Guanine nucleotide binding protein (g protein), gamma 11 (GNG11, Accession NP_004117.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG11.

[21161] HEMK (Accession NP_057257.1) is another GAM133 target gene, herein designated TARGET GENE. HEMK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:2688, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21162] Another function of GAM133 is therefore inhibition of HEMK (Accession NP_057257.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK.

[21163] Homeo box c8 (HOXC8, Accession NP_073149.1) is an-

other GAM133 target gene, herein designated TARGET GENE. HOXC8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HOXC8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXC8 BINDING SITE, designated SEQ ID:15450, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21164] Another function of GAM133 is therefore inhibition of Homeo box c8 (HOXC8, Accession NP_073149.1), a gene which is part of a developmental regulatory system . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC8.

[21165] The function of HOXC8 has been established by previous studies. reviewed by Acampora et al. (1989), the homeo box region 3, which maps to 12q12- q13, contains at least 7 homeo boxes in 160 kb of DNA. HOX3A is homologous to mouse Hox- 3.1; HOX3B to mouse Hox- 3.2; HOX3C to mouse Hox- 6.1, and HOX3D to mouse Hox- 6.2. The order of genes, from 5- prime to 3- prime, is

HOX3G, HOX3F, HOX3B, HOX3A, HOX3C, HOX3D, HOX3E (Acampora et al., 1989). Masuda et al. (1991) mapped the feline equivalent to chromosome B4, which shares syntenic homology with human chromosome 12 and mouse chromosome 15. This gene is also called HOXC8; see HOXC9 (OMIM Ref. No. 142971). Yueh et al. (1998) showed that overexpression of a Hoxc8 transgene causes cartilage defects whose severity depends on transgene dosage. The abnormal cartilage is characterized by an accumulation of proliferating chondrocytes and reduced maturation. Since Hoxc8 is normally expressed in chondrocytes, these results suggested that Hoxc8 continues to regulate skeletal development well beyond pattern formation in a tissue- specific manner, presumably by controlling the progression of cells along the chondrocyte differentiation pathway. They found that Hoxd4 and Hoxc8 appear to act on chondrocyte differentiation in a similar manner. The protein sequences of the 2 share 67% identity within the homeodomain and 50% in the hexapeptide motif but little similarity in the remaining 70% of the molecules. Isl1, which shares no significant sequence similarities with Hoxc8 or Hoxd4, is not associated with abnormalities of skeletal development, implying that the

cartilage abnormalities are specifically induced by HOX genes. The capacity of the HOX genes to regulate cartilage differentiation suggests that they may be involved in human chondrodysplasias or other cartilage disorders.

[21166]

[21167] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21168] Masuda, R.; Yuhki, N.; O'Brien, S. J. : Molecular cloning, chromosomal assignment, and nucleotide sequence of the feline homeobox HOX3A. Genomics 11: 1007- 1013, 1991. ; and

[21169] Rabin, M.; Ferguson- Smith, A.; Hart, C. P.; Ruddle, F. H. : Cognate homeo- box loci mapped on homologous human and mouse chromosomes. Proc. Nat. Acad. Sci. 83: 9104- 9108, 1986.

[21170] Further studies establishing the function and utilities of HOXC8 are found in John Hopkins OMIM database record ID 142970, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interferon regulatory factor 7 (IRF7, Accession NP_004021.1) is another GAM133 target gene, herein designated TARGET GENE. IRF7 BINDING SITE1 and IRF7 BINDING SITE2 are

target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by IRF7, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRF7 BINDING SITE1 and IRF7 BINDING SITE2, designated SEQ ID:2970 and SEQ ID:19298 respectively, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21171] Another function of GAM133 is therefore inhibition of Interferon regulatory factor 7 (IRF7, Accession NP_004021.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF7.

[21172] KIAA0090 (Accession NP_055862.1) is another GAM133 target gene, herein designated TARGET GENE. KIAA0090 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0090, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:9336, to the nucleotide sequence of GAM133 RNA, herein designated

GAM RNA, also designated SEQ ID:211.

[21173] Another function of GAM133 is therefore inhibition of KIAA0090 (Accession NP_055862.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090.

[21174] KIAA0931 (Accession XP_041191.2) is another GAM133 target gene, herein designated TARGET GENE. KIAA0931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:11269, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21175] Another function of GAM133 is therefore inhibition of KIAA0931 (Accession XP_041191.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931.

[21176] KIAA1600 (Accession XP_049351.2) is another GAM133 target gene, herein designated TARGET GENE. KIAA1600

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1600, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:6810, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21177] Another function of GAM133 is therefore inhibition of KIAA1600 (Accession XP_049351.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600.

[21178] LNK (Accession NP_005466.1) is another GAM133 target gene, herein designated TARGET GENE. LNK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LNK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:15247, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21179] Another function of GAM133 is therefore inhibition of LNK (Accession NP_005466.1), a gene which links T- cell receptor activation signal to phospholipase c- gamma- 1, grb- 2 and phosphatidylinositol 3- kinase (by similarity). Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK.

[21180] The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.LOC130813 (Accession XP_065904.1) is another GAM133 target gene, herein designated TARGET GENE. LOC130813 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:11094, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21181] Another function of GAM133 is therefore inhibition of LOC130813 (Accession XP_065904.1) . Accordingly, utili-

ties of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813.

[21182] LOC147080 (Accession XP_097182.1) is another GAM133 target gene, herein designated TARGET GENE. LOC147080 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147080 BINDING SITE, designated SEQ ID:18953, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21183] Another function of GAM133 is therefore inhibition of LOC147080 (Accession XP_097182.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147080.

[21184] LOC150157 (Accession XP_097823.1) is another GAM133 target gene, herein designated TARGET GENE. LOC150157 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150157, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:13132, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21185] Another function of GAM133 is therefore inhibition of LOC150157 (Accession XP_097823.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157.

[21186] LOC151178 (Accession XP_087117.1) is another GAM133 target gene, herein designated TARGET GENE. LOC151178 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151178, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151178 BINDING SITE, designated SEQ ID:1582, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21187] Another function of GAM133 is therefore inhibition of LOC151178 (Accession XP_087117.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151178.

[21188] LOC152098 (Accession XP_087384.2) is another GAM133 target gene, herein designated TARGET GENE. LOC152098 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152098, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152098 BINDING SITE, designated SEQ ID:16013, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21189] Another function of GAM133 is therefore inhibition of LOC152098 (Accession XP_087384.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152098.

[21190] LOC152286 (Accession XP_098188.1) is another GAM133 target gene, herein designated TARGET GENE. LOC152286 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC152286 BINDING SITE, designated SEQ ID:17068, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21191] Another function of GAM133 is therefore inhibition of LOC152286 (Accession XP_098188.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152286.

[21192] LOC153811 (Accession XP_087779.2) is another GAM133 target gene, herein designated TARGET GENE. LOC153811 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153811, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:6064, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21193] Another function of GAM133 is therefore inhibition of LOC153811 (Accession XP_087779.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153811.

[21194] LOC200030 (Accession XP_086515.7) is another GAM133 target gene, herein designated TARGET GENE. LOC200030 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200030, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200030 BINDING SITE, designated SEQ ID:19333, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21195] Another function of GAM133 is therefore inhibition of LOC200030 (Accession XP_086515.7) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200030.

[21196] LOC200205 (Accession XP_114152.1) is another GAM133 target gene, herein designated TARGET GENE. LOC200205 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200205, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC200205 BINDING SITE, designated SEQ ID:14264, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21197] Another function of GAM133 is therefore inhibition of LOC200205 (Accession XP_114152.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200205.

[21198] LOC200609 (Accession XP_117256.1) is another GAM133 target gene, herein designated TARGET GENE. LOC200609 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200609, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:19040, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21199] Another function of GAM133 is therefore inhibition of LOC200609 (Accession XP_117256.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609.

[21200] LOC220739 (Accession XP_167548.3) is another GAM133 target gene, herein designated TARGET GENE. LOC220739 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220739, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:13763, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21201] Another function of GAM133 is therefore inhibition of LOC220739 (Accession XP_167548.3) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220739.

[21202] LOC223082 (Accession NP_667339.1) is another GAM133 target gene, herein designated TARGET GENE. LOC223082 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC223082, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC223082 BINDING SITE, designated SEQ ID:880, to

the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21203] Another function of GAM133 is therefore inhibition of LOC223082 (Accession NP_667339.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC223082.

[21204] LOC283778 (Accession XP_211199.1) is another GAM133 target gene, herein designated TARGET GENE. LOC283778 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283778, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283778 BINDING SITE, designated SEQ ID:3741, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21205] Another function of GAM133 is therefore inhibition of LOC283778 (Accession XP_211199.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283778.

[21206] LOC283834 (Accession XP_211225.1) is another GAM133

target gene, herein designated TARGET GENE. LOC283834 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283834, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283834 BINDING SITE, designated SEQ ID:16248, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21207] Another function of GAM133 is therefore inhibition of LOC283834 (Accession XP_211225.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283834.

[21208] LOC284080 (Accession XP_211322.1) is another GAM133 target gene, herein designated TARGET GENE. LOC284080 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284080 BINDING SITE, designated SEQ ID:12843, to the nucleotide sequence of GAM133 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:211.

[21209] Another function of GAM133 is therefore inhibition of LOC284080 (Accession XP_211322.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284080.

[21210] LOC284410 (Accession XP_211449.1) is another GAM133 target gene, herein designated TARGET GENE. LOC284410 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284410, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284410 BINDING SITE, designated SEQ ID:2956, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21211] Another function of GAM133 is therefore inhibition of LOC284410 (Accession XP_211449.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284410.

[21212] LOC284431 (Accession XP_209201.1) is another GAM133 target gene, herein designated TARGET GENE. LOC284431

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284431, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284431 BINDING SITE, designated SEQ ID:4523, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21213] Another function of GAM133 is therefore inhibition of LOC284431 (Accession XP_209201.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284431.

[21214] LOC284642 (Accession XP_208231.1) is another GAM133 target gene, herein designated TARGET GENE. LOC284642 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284642, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284642 BINDING SITE, designated SEQ ID:3697, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21215] Another function of GAM133 is therefore inhibition of LOC284642 (Accession XP_208231.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284642.

[21216] LOC284803 (Accession XP_211642.1) is another GAM133 target gene, herein designated TARGET GENE. LOC284803 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284803 BINDING SITE, designated SEQ ID:13866, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21217] Another function of GAM133 is therefore inhibition of LOC284803 (Accession XP_211642.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284803.

[21218] LOC284834 (Accession XP_209378.1) is another GAM133 target gene, herein designated TARGET GENE. LOC284834 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284834, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284834 BINDING SITE, designated SEQ ID:11970, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21219] Another function of GAM133 is therefore inhibition of LOC284834 (Accession XP_209378.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284834.

[21220] LOC284857 (Accession XP_211671.1) is another GAM133 target gene, herein designated TARGET GENE. LOC284857 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284857, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284857 BINDING SITE, designated SEQ ID:8371, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21221] Another function of GAM133 is therefore inhibition of

LOC284857 (Accession XP_211671.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284857.

[21222] LOC285419 (Accession XP_211890.1) is another GAM133 target gene, herein designated TARGET GENE. LOC285419 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285419, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285419 BINDING SITE, designated SEQ ID:10677, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21223] Another function of GAM133 is therefore inhibition of LOC285419 (Accession XP_211890.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285419.

[21224] LOC285717 (Accession XP_211991.1) is another GAM133 target gene, herein designated TARGET GENE. LOC285717 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285717, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285717 BINDING SITE, designated SEQ ID:19478, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21225] Another function of GAM133 is therefore inhibition of LOC285717 (Accession XP_211991.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285717.

[21226] LOC285827 (Accession XP_212038.1) is another GAM133 target gene, herein designated TARGET GENE. LOC285827 BINDING SITE1 and LOC285827 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by LOC285827, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285827 BINDING SITE1 and LOC285827 BINDING SITE2, designated SEQ ID:13487 and SEQ ID:5696 respectively, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21227] Another function of GAM133 is therefore inhibition of LOC285827 (Accession XP_212038.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285827.

[21228] LOC285827 (Accession XP_212645.1) is another GAM133 target gene, herein designated TARGET GENE. LOC285827 BINDING SITE1 and LOC285827 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by LOC285827, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285827 BINDING SITE1 and LOC285827 BINDING SITE2, designated SEQ ID:13487 and SEQ ID:20006 respectively, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21229] Another function of GAM133 is therefore inhibition of LOC285827 (Accession XP_212645.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285827.

[21230] LOC286026 (Accession XP_212119.1) is another GAM133

target gene, herein designated TARGET GENE. LOC286026 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286026, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286026 BINDING SITE, designated SEQ ID:13488, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21231] Another function of GAM133 is therefore inhibition of LOC286026 (Accession XP_212119.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286026.

[21232] LOC286126 (Accession XP_212185.1) is another GAM133 target gene, herein designated TARGET GENE. LOC286126 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286126, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286126 BINDING SITE, designated SEQ ID:11832, to the nucleotide sequence of GAM133 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:211.

[21233] Another function of GAM133 is therefore inhibition of LOC286126 (Accession XP_212185.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286126.

[21234] LOC286299 (Accession XP_212257.1) is another GAM133 target gene, herein designated TARGET GENE. LOC286299 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286299, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286299 BINDING SITE, designated SEQ ID:19909, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21235] Another function of GAM133 is therefore inhibition of LOC286299 (Accession XP_212257.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286299.

[21236] LOC286384 (Accession XP_212305.2) is another GAM133 target gene, herein designated TARGET GENE. LOC286384

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286384, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286384 BINDING SITE, designated SEQ ID:18912, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21237] Another function of GAM133 is therefore inhibition of LOC286384 (Accession XP_212305.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286384.

[21238] LOC340156 (Accession XP_291158.1) is another GAM133 target gene, herein designated TARGET GENE. LOC340156 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340156 BINDING SITE, designated SEQ ID:16425, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21239] Another function of GAM133 is therefore inhibition of LOC340156 (Accession XP_291158.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340156.

[21240] LOC340268 (Accession XP_294634.1) is another GAM133 target gene, herein designated TARGET GENE. LOC340268 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340268 BINDING SITE, designated SEQ ID:8452, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21241] Another function of GAM133 is therefore inhibition of LOC340268 (Accession XP_294634.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340268.

[21242] LOC340319 (Accession XP_295216.1) is another GAM133 target gene, herein designated TARGET GENE. LOC340319 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC340319, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340319 BINDING SITE, designated SEQ ID:17510, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21243] Another function of GAM133 is therefore inhibition of LOC340319 (Accession XP_295216.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340319.

[21244] LOC349557 (Accession XP_301266.1) is another GAM133 target gene, herein designated TARGET GENE. LOC349557 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349557, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349557 BINDING SITE, designated SEQ ID:20112, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21245] Another function of GAM133 is therefore inhibition of

LOC349557 (Accession XP_301266.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349557.

[21246] LOC57228 (Accession NP_065200.1) is another GAM133 target gene, herein designated TARGET GENE. LOC57228 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC57228, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57228 BINDING SITE, designated SEQ ID:15721, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21247] Another function of GAM133 is therefore inhibition of LOC57228 (Accession NP_065200.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57228.

[21248] LOC90470 (Accession XP_031975.1) is another GAM133 target gene, herein designated TARGET GENE. LOC90470 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90470, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90470 BINDING SITE, designated SEQ ID:3057, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21249] Another function of GAM133 is therefore inhibition of LOC90470 (Accession XP_031975.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90470.

[21250] LUC7A (Accession NP_057508.2) is another GAM133 target gene, herein designated TARGET GENE. LUC7A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LUC7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LUC7A BINDING SITE, designated SEQ ID:11723, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21251] Another function of GAM133 is therefore inhibition of LUC7A (Accession NP_057508.2) . Accordingly, utilities of

GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUC7A.

[21252] Mannan-binding lectin serine protease 2 (MASP2, Accession NP_631947.1) is another GAM133 target gene, herein designated TARGET GENE. MASP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MASP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MASP2 BINDING SITE, designated SEQ ID:1650, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21253] Another function of GAM133 is therefore inhibition of Mannan-binding lectin serine protease 2 (MASP2, Accession NP_631947.1), a gene which be involved in an antibody- independent pathway that is initiated by binding of the mannan- binding lectin . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP2.

[21254] The function of MASP2 has been established by previous studies. The complement system is essential for the operation of the innate and adaptive immune defense. In addi-

tion to the classic pathway initiated by antigen- antibody complexes and the alternative pathway initiated by structures on microbial surfaces, there is an antibody- independent pathway that is initiated by binding of the mannan- binding lectin (MBL; 154545), which is structurally related to C1q (see OMIM Ref. No. 120550), to carbohydrates. MBL, the plasma levels of which are genetically determined, activates the complement pathway through the mannan- binding lectin serine proteases, or MASPs (see OMIM Ref. No. MASP1; 600521). Using affinity chromatography to purify carbohydrate- binding plasma proteins, followed by microsequence analysis and by RT- PCR on a liver cDNA library, Thiel et al. (1997) identified a cDNA encoding MASP2. MASP2 was expressed as a 52- kD protein under reducing conditions. Sequence analysis predicted that the 686- amino acid MASP2 protein shares 46 to 52% amino acid similarity (taking into account residues of a similar nature as well as identical residues) with C1r (see OMIM Ref. No. 216950), C1s (OMIM Ref. No. 120580), and MASP1; these proteins also share the same domain organization. MASP2 contains a 15- amino acid signal peptide, the 3 amino acids essential for the active center of a serine protease, and calcium- binding residues in the

epidermal growth factor (EGF; 131530)- like domain. Unlike MASP1, however, MASP2 has no sites for N- linked glycosylation. Overall, MASP1 is most homologous to C1r and MASP2 is most homologous to C1s, supporting the notion that the MBL pathway may antedate the development of the specific immune system of vertebrates. Functional analysis showed that MASP2 activates C4 (see OMIM Ref. No. 120810), a requirement for the generation of a C3 (OMIM Ref. No. 120700)- converting complex. By screening a liver cDNA library, Stover et al. (1999) identified a cDNA encoding a shorter variant of MASP2, which they termed MAP19 (MBL- associated plasma protein of 19 kD). The deduced 185- amino acid MAP19 protein retains the signal peptide, the N- terminal CUB (see OMIM Ref. No. CUBN; 602997) domain, and the EGF- like domain of full- length MASP2, but it has a unique C- terminal sequence (EQSL) and lacks the serine protease catalytic domain. Northern blot analysis revealed higher expression of the 1.0- kb MAP19 transcript than of the 2.6- kb transcript encoding the serine protease domain of MASP2. Immunoblot analysis indicated that uncleaved MASP2 is expressed as a 76- kD protein, while the A chain has a molecular mass of 52 kD and the B chain has a mass of 31

kD. Stover et al. (1999) proposed that MAP19 has a role in modulating the activation of complement via the MBL pathway. By biochemical purification of a 22- kD protein associated with MASP1 preparations and peptide sequence analysis, Takahashi et al. (1999) cloned the short variant of MASP2, which they termed sMAP (small MBL- associated protein). Northern blot and RT- PCR analyses showed that MASP2 is expressed in the liver and that the short variant is the major transcript. By FISH, Stover et al. (1999) mapped the MASP2 gene to 1p36.3- p36.2. They confirmed this localization by radiation hybrid analysis.

[21255]

[21256] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21257] Stover, C. M.; Thiel, S.; Thelen, M.; Lynch, N. J.; Vorup-Jensen, T.; Jensenius, J. C.; Schwaeble, W. J. : Two constituents of the initiation complex of the mannan- binding lectin activation pathway of complement are encoded by a single structural gene. J. Immun. 162: 3481- 3490, 1999. ; and

[21258] Stover, C. M.; Schwaeble, W. J.; Lynch, N. J.; Thiel, S.; Speicher, M. R. : Assignment of the gene encoding mannan-

binding lectin- associated serine protease 2 (MASP2) to human chromosom.

[21259] Further studies establishing the function and utilities of MASP2 are found in John Hopkins OMIM database record ID 605102, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mannosyl (alpha-1,3-)-glycoprotein beta-1,4-n-acetylglucosaminyltransferase, isoenzyme a (MGAT4A, Accession NP_036346.1) is another GAM133 target gene, herein designated TARGET GENE. MGAT4A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGAT4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGAT4A BINDING SITE, designated SEQ ID:18765, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21260] Another function of GAM133 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein beta-1,4-n-acetylglucosaminyltransferase, isoenzyme a (MGAT4A, Accession NP_036346.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGAT4A.

[21261] MGC11242 (Accession NP_077296.1) is another GAM133 target gene, herein designated TARGET GENE. MGC11242 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11242, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11242 BINDING SITE, designated SEQ ID:8424, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21262] Another function of GAM133 is therefore inhibition of MGC11242 (Accession NP_077296.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11242.

[21263] MGC2817 (Accession NP_115900.1) is another GAM133 target gene, herein designated TARGET GENE. MGC2817 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC2817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC2817 BINDING SITE, designated SEQ ID:16603, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21264] Another function of GAM133 is therefore inhibition of MGC2817 (Accession NP_115900.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2817.

[21265] Neuromedin u (NMU, Accession NP_006672.1) is another GAM133 target gene, herein designated TARGET GENE. NMU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NMU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NMU BINDING SITE, designated SEQ ID:14657, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21266] Another function of GAM133 is therefore inhibition of Neuromedin u (NMU, Accession NP_006672.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with NMU.

[21267] Neurotensin receptor 1 (high affinity) (NTSR1, Accession NP_002522.1) is another GAM133 target gene, herein designated TARGET GENE. NTSR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NTSR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:2175, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21268] Another function of GAM133 is therefore inhibition of Neurotensin receptor 1 (high affinity) (NTSR1, Accession NP_002522.1), a gene which is associated with g proteins that activate a phosphatidylinositol- calcium second messenger system. Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1.

[21269] The function of NTSR1 has been established by previous studies. The tridecapeptide neurotensin (OMIM Ref. No. 162650) is widely distributed in various regions of the brain and in peripheral tissues. In the brain, neurotensin acts as a neuromodulator, in particular of dopamine

transmission in the nigrostriatal and mesocorticolimbic systems, suggesting its possible implication in dopamine-associated behavioral neurodegenerative and neuropsychiatric disorders. Its various effects are mediated by specific membrane receptors. Vita et al. (1993) isolated a cDNA encoding a human neurotensin receptor (NTSR1) and showed that it predicts a 418- amino acid protein that shares 84% homology with the rat protein. Le et al. (1997) also cloned human NTSR1 cDNA and its genomic DNA. The gene contains 4 exons and spans more than 10 kb. The authors identified a highly polymorphic tetranucleotide repeat approximately 3 kb from the gene. Southern blot analysis revealed that the NTSR1 gene is present in the human genome as a single- copy gene. Le et al. (1997) stated that the neurotensin receptor has 7 transmembrane spanning regions and high homology to other receptors that couple to G proteins. Vincent (1995) reviewed pharmacologic and molecular data suggesting the existence of other types of functional neurotensin receptors.

[21270]

[21271] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[21272] Le, F.; Groshan, K.; Zeng, X. P.; Richelson, E. : Characterization of the genomic structure, promoter region, and a tetranucleotide repeat polymorphism of the human neurotensin receptor gene. J. Biol. Chem. 272: 1315- 1322, 1997. ; and

[21273] Vincent, J.- P. : Neurotensin receptors: binding properties, transduction pathways, and structure. Cell. Molec. Neurobiol. 15: 501- 512, 1995.

[21274] Further studies establishing the function and utilities of NTSR1 are found in John Hopkins OMIM database record ID 162651, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear mitotic apparatus protein 1 (NUMA1, Accession NP_006176.1) is another GAM133 target gene, herein designated TARGET GENE. NUMA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUMA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:9820, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:211.

[21275] Another function of GAM133 is therefore inhibition of Nuclear mitotic apparatus protein 1 (NUMA1, Accession NP_006176.1), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1.

[21276] The function of NUMA1 has been established by previous studies. The NuMA protein was one of the first to be described as a cell cycle- related protein based on a distinct immunofluorescent staining pattern: in interphase, NuMA is present throughout the nucleus, and in mitosis, it localizes to the spindle apparatus (Lydersen and Pettijohn, 1980). Some patients with autoimmune disease have antibodies directed against the NuMA protein. The full-length NUMA cDNA (Compton et al., 1992; Yang et al., 1992) predicts a protein with the largest known coiled-coil region in a protein. By fluorescence in situ hybridization, Sparks et al. (1993) demonstrated that the NUMA1 gene is present in single copy and located on 11q13. Acute promyelocytic leukemia (APL) is uniquely associated with chromosomal translocations that disrupt the gene encoding the retinoic acid receptor, RARA (OMIM Ref. No.

180240). In more than 99% of cases, this disruption results in the formation of a fusion of the RARA gene with the PML gene (OMIM Ref. No. 102578). In rare variants of APL, the RARA gene has been found to be fused to 1 of 2 other genes, PLZF (OMIM Ref. No. 176797) and NPM (OMIM Ref. No. 164040). Although RARA dysregulation is evidently important in APL, the role of the various fusion partners is unclear. Wells et al. (1997) characterized a fourth APL gene fusion, which linked exons encoding the retinoic acid and DNA- binding domains of RARA to 5-prime exons of NUMA1. The NUMA/RARA fusion protein existed in sheet- like nuclear aggregates with which normal NUMA partly colocalized. In contrast to t(15;17) APL (the usual variety) the intracellular distribution of PML was normal in these cells. Wells et al. (1997) suggested that interference with retinoid signaling, and not disruption of PML organization, is essential to the APL phenotype. Their work implicated for the first time an element of the mitotic apparatus in the molecular pathogenesis of human malignancy. The proband of their study was a Caucasian male first seen at 6 months of age for investigation of multiple cutaneous lesions. Despite this unusual clinical presentation, peripheral blood morphology and cell- sur-

face immunophenotype were typical of APL. Routine analysis of diagnostic bone marrow revealed a clonal cytogenetic abnormality, t(11;17)(q13;q21). The patient was treated with all- trans retinoic acid and achieved complete remission; he remained in morphologic remission 38 months after autologous bone marrow transplantation.

[21277]

[21278] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21279] Lydersen, B. K.; Pettijohn, D. E. : Human- specific nuclear protein that associates with the polar region of the mitotic apparatus: distribution in a human/hamster hybrid cell. Cell 22: 489- 499, 1980. ; and

[21280] Wells, R. A.; Catzavelos, C.; Kamel- Reid, S. : Fusion of retinoic acid receptor alpha to NuMA, the nuclear mitotic apparatus protein, by a variant translocation in acute promyelocytic l.

[21281] Further studies establishing the function and utilities of NUMA1 are found in John Hopkins OMIM database record ID 164009, and in cited publications listed in Table 5, which are hereby incorporated by reference.Optic atrophy 3 (autosomal recessive, with chorea and spastic paraple-

gia) (OPA3, Accession NP_079412.1) is another GAM133 target gene, herein designated TARGET GENE. OPA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OPA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPA3 BINDING SITE, designated SEQ ID:4447, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21282] Another function of GAM133 is therefore inhibition of Optic atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NP_079412.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA3.

[21283] Oxidative-stress responsive 1 (OSR1, Accession NP_005100.1) is another GAM133 target gene, herein designated TARGET GENE. OSR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:15350, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21284] Another function of GAM133 is therefore inhibition of Oxidative-stress responsive 1 (OSR1, Accession NP_005100.1), a gene which mediats stress- activated signals. Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1.

[21285] The function of OSR1 has been established by previous studies. The 3p22- p21.3 chromosomal region is one of 3 regions of 3p that is commonly deleted in various carcinomas. By analyzing a cloned segment from this region, Tamari et al. (1999) identified a novel gene that they designated OSR1 (oxidative stress- responsive- 1) because the predicted 527- amino acid protein shares 39% identity with Ste20/oxidant stress- response kinase- 1 (OMIM Ref. No. 602255). The OSR1 gene contains 18 exons and spans approximately 90 kb. Northern blot analysis revealed that OSR1 was expressed as a 4.6- kb major transcript in all tissues tested. A less abundant 7.5- kb mRNA was detected in heart and skeletal muscle. Daigo et al.

(1999) reported that the OSR1 gene is located between the OCTL1 (OMIM Ref. No. 604047) and MYD88 (OMIM Ref. No. 602170) genes on 3p22- p21.3.

[21286]

[21287] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21288] Tamari, M.; Daigo, Y.; Nakamura, Y. : Isolation and characterization of a novel serine threonine kinase gene on chromosome 3q22- 21.3. J. Hum. Genet. 44: 116- 120, 1999. ; and

[21289] Daigo, Y.; Isomura, M.; Nishiwaki, T.; Tamari, M.; Ishikawa, S.; Kai, M.; Murata, Y.; Takeuchi, K.; Yamane, Y.; Hayashi, R.; Minami, M.; Fujino, M. A.; Hojo, Y.; Uchiyama, I.; Takagi, T.;.

[21290] Further studies establishing the function and utilities of OSR1 are found in John Hopkins OMIM database record ID 604046, and in cited publications listed in Table 5, which are hereby incorporated by reference.PF20 (Accession NP_078808.2) is another GAM133 target gene, herein designated TARGET GENE. PF20 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PF20, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PF20 BINDING SITE, designated SEQ ID:1865, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21291] Another function of GAM133 is therefore inhibition of PF20 (Accession NP_078808.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PF20.

[21292] Paraneoplastic antigen like 5 (PNMA5, Accession NP_443158.1) is another GAM133 target gene, herein designated TARGET GENE. PNMA5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PNMA5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PNMA5 BINDING SITE, designated SEQ ID:13736, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21293] Another function of GAM133 is therefore inhibition of Paraneoplastic antigen like 5 (PNMA5, Accession NP_443158.1) . Accordingly, utilities of GAM133 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PNMA5.

[21294] Protein-o-mannosyltransferase 1 (POMT1, Accession NP_009102.2) is another GAM133 target gene, herein designated TARGET GENE. POMT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POMT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POMT1 BINDING SITE, designated SEQ ID:15100, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21295] Another function of GAM133 is therefore inhibition of Protein-o-mannosyltransferase 1 (POMT1, Accession NP_009102.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT1.

[21296] Ran binding protein 3 (RANBP3, Accession NP_015560.1) is another GAM133 target gene, herein designated TARGET GENE. RANBP3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RANBP3, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RANBP3 BINDING SITE, designated SEQ ID:1217, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21297] Another function of GAM133 is therefore inhibition of Ran binding protein 3 (RANBP3, Accession NP_015560.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP3.

[21298] Ras guanyl releasing protein 4 (RASGRP4, Accession NP_733748.1) is another GAM133 target gene, herein designated TARGET GENE. RASGRP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASGRP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:10789, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21299] Another function of GAM133 is therefore inhibition of Ras

guanyl releasing protein 4 (RASGRP4, Accession NP_733748.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4.

[21300] Ras guanyl releasing protein 4 (RASGRP4, Accession NP_733747.1) is another GAM133 target gene, herein designated TARGET GENE. RASGRP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASGRP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:10789, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21301] Another function of GAM133 is therefore inhibition of Ras guanyl releasing protein 4 (RASGRP4, Accession NP_733747.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4.

[21302] Ras guanyl releasing protein 4 (RASGRP4, Accession NP_443181.2) is another GAM133 target gene, herein designated TARGET GENE. RASGRP4 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASGRP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:10789, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21303] Another function of GAM133 is therefore inhibition of Ras guanyl releasing protein 4 (RASGRP4, Accession NP_443181.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4.

[21304] RNF121 (Accession NP_060790.2) is another GAM133 target gene, herein designated TARGET GENE. RNF121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF121 BINDING SITE, designated SEQ ID:8732, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21305] Another function of GAM133 is therefore inhibition of RNF121 (Accession NP_060790.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF121.

[21306] Ribulose-5-phosphate-3-epimerase (RPE, Accession NP_008847.1) is another GAM133 target gene, herein designated TARGET GENE. RPE BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RPE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPE BINDING SITE, designated SEQ ID:5773, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21307] Another function of GAM133 is therefore inhibition of Ribulose-5-phosphate-3-epimerase (RPE, Accession NP_008847.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPE.

[21308] SELM (Accession NP_536355.1) is another GAM133 target gene, herein designated TARGET GENE. SELM BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by SELM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SELM BINDING SITE, designated SEQ ID:15560, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21309] Another function of GAM133 is therefore inhibition of SELM (Accession NP_536355.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELM.

[21310] SLC9A8 (Accession XP_030524.2) is another GAM133 target gene, herein designated TARGET GENE. SLC9A8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC9A8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC9A8 BINDING SITE, designated SEQ ID:17493, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21311] Another function of GAM133 is therefore inhibition of SLC9A8 (Accession XP_030524.2) . Accordingly, utilities of

GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A8.

[21312] Transcription factor 7 (t-cell specific, hmg-box) (TCF7, Accession NP_003193.1) is another GAM133 target gene, herein designated TARGET GENE. TCF7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCF7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:15351, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21313] Another function of GAM133 is therefore inhibition of Transcription factor 7 (t-cell specific, hmg-box) (TCF7, Accession NP_003193.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7.

[21314] Tgfb inducible early growth response (TIEG, Accession NP_005646.1) is another GAM133 target gene, herein designated TARGET GENE. TIEG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TIEG, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIEG BINDING SITE, designated SEQ ID:6313, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21315] Another function of GAM133 is therefore inhibition of Tgfb inducible early growth response (TIEG, Accession NP_005646.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIEG.

[21316] Ubiquitin-conjugating enzyme e2, j2 (ubc6 homolog, yeast) (UBE2J2, Accession NP_477515.1) is another GAM133 target gene, herein designated TARGET GENE. UBE2J2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBE2J2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2J2 BINDING SITE, designated SEQ ID:7344, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21317] Another function of GAM133 is therefore inhibition of Ubiquitin-conjugating enzyme e2, j2 (ubc6 homolog,

yeast) (UBE2J2, Accession NP_477515.1) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2J2.

[21318] Zinc finger protein 6 (cmpx1) (ZNF6, Accession NP_068838.2) is another GAM133 target gene, herein designated TARGET GENE. ZNF6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF6 BINDING SITE, designated SEQ ID:740, to the nucleotide sequence of GAM133 RNA, herein designated GAM RNA, also designated SEQ ID:211.

[21319] Another function of GAM133 is therefore inhibition of Zinc finger protein 6 (cmpx1) (ZNF6, Accession NP_068838.2) . Accordingly, utilities of GAM133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF6.

[21320]

[21321] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 134

(GAM134), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21322] GAM134 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM134 was detected is described hereinabove with reference to Figs. 8-15.

[21323] GAM134 gene, herein designated GAM GENE, and GAM134 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[21324] GAM134 gene encodes a GAM134 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM134 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM134 precursor RNA is designated SEQ ID:45, and is provided hereinbelow with reference to the sequence listing part.

[21325] GAM134 precursor RNA folds onto itself, forming GAM134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21326] GAM134 precursor RNA folds onto itself, forming GAM134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[21327] Nucleotide sequence of GAM134 precursor RNA, designated SEQ-ID: 45, and a schematic representation of a predicted secondary folding of GAM134 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[21328] An enzyme complex designated DICER COMPLEX, `dices` the GAM134 folded precursor RNA into GAM134 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM134 RNA is designated SEQ ID:339, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[21329] GAM134 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM134 target RNA, herein designated GAM TARGET RNA. GAM134 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21330] GAM134 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM134 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM134 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING

SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM134 RNA may have a different number of target binding sites in untranslated regions of a GAM134 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21331] The complementary binding of GAM134 RNA, herein designated GAM RNA, to target binding sites on GAM134 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM134 target RNA into GAM134 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21332] It is appreciated that GAM134 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM134 target genes. The mRNA of each one of this plurality of GAM134 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM134 RNA,

herein designated GAM RNA, and which when bound by GAM134 RNA causes inhibition of translation of respective one or more GAM134 target proteins.

[21333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM134 gene, herein designated GAM GENE, on one or more GAM134 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21334] It is appreciated that specific functions and accordingly utilities of GAM134 correlate with, and may be deduced from, the identity of the target genes which GAM134 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[21335]

[21336]

[21337] FLJ12876 (Accession) is a GAM134 target gene, herein designated TARGET GENE. FLJ12876 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12876, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12876 BINDING SITE, designated SEQ ID:19411, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21338] A function of GAM134 is therefore inhibition of FLJ12876 (Accession) . Accordingly, utilities of GAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12876.

[21339] FLJ13842 (Accession NM_024645.1) is another GAM134 target gene, herein designated TARGET GENE. FLJ13842 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13842, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13842 BINDING SITE, designated SEQ ID:3226, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21340] Another function of GAM134 is therefore inhibition of FLJ13842 (Accession NM_024645.1) . Accordingly, utilities of GAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13842.

[21341] Interleukin 18 receptor accessory protein (IL18RAP, Accession NM_003853.2) is another GAM134 target gene, herein designated TARGET GENE. IL18RAP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL18RAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL18RAP BINDING SITE, designated SEQ ID:3711, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21342] Another function of GAM134 is therefore inhibition of Interleukin 18 receptor accessory protein (IL18RAP, Acces-

sion NM_003853.2) . Accordingly, utilities of GAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL18RAP.

[21343] LOC256380 (Accession XM_171128.2) is another GAM134 target gene, herein designated TARGET GENE. LOC256380 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256380, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256380 BINDING SITE, designated SEQ ID:19605, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21344] Another function of GAM134 is therefore inhibition of LOC256380 (Accession XM_171128.2) . Accordingly, utilities of GAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256380.

[21345] Mitogen-activated protein kinase kinase kinase 7 interacting protein 1 (MAP3K7IP1, Accession NM_006116.1) is another GAM134 target gene, herein designated TARGET GENE. MAP3K7IP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

MAP3K7IP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K7IP1 BINDING SITE, designated SEQ ID:9771, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21346] Another function of GAM134 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 7 interacting protein 1 (MAP3K7IP1, Accession NM_006116.1), a gene which may be an important signaling intermediate between tgfb receptors and map3k7/tak1. Accordingly, utilities of GAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP1.

[21347] The function of MAP3K7IP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.SCIN (Accession NM_033128.1) is another GAM134 target gene, herein designated TARGET GENE. SCIN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SCIN, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCIN BINDING SITE, designated SEQ ID:6572, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21348] Another function of GAM134 is therefore inhibition of SCIN (Accession NM_033128.1) . Accordingly, utilities of GAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCIN.

[21349] Sh3-domain binding protein 2 (SH3BP2, Accession NM_003023.2) is another GAM134 target gene, herein designated TARGET GENE. SH3BP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3BP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:4548, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21350] Another function of GAM134 is therefore inhibition of Sh3-domain binding protein 2 (SH3BP2, Accession NM_003023.2) . Accordingly, utilities of GAM134 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2.

[21351] SOX30 (Accession NM_007017.1) is another GAM134 target gene, herein designated TARGET GENE. SOX30 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SOX30, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX30 BINDING SITE, designated SEQ ID:7345, to the nucleotide sequence of GAM134 RNA, herein designated GAM RNA, also designated SEQ ID:339.

[21352] Another function of GAM134 is therefore inhibition of SOX30 (Accession NM_007017.1) . Accordingly, utilities of GAM134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX30.

[21353]

[21354] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 135 (GAM135), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21355] GAM135 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM135 was detected is described hereinabove with reference to Figs. 8-15.

[21356] GAM135 gene, herein designated GAM GENE, and GAM135 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[21357] GAM135 gene encodes a GAM135 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM135 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM135 precursor RNA is designated SEQ ID:142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:142 is located at position 88359935 relative to chromosome 15.

[21358] GAM135 precursor RNA folds onto itself, forming GAM135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21359] GAM135 precursor RNA folds onto itself, forming GAM135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[21360] Nucleotide sequence of GAM135 precursor RNA, designated SEQ-ID: 142, and a schematic representation of a predicted secondary folding of GAM135 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[21361] An enzyme complex designated DICER COMPLEX, `dices` the GAM135 folded precursor RNA into GAM135 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM135 RNA is designated SEQ ID:248, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[21362] GAM135 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM135 target RNA, herein designated GAM TARGET RNA. GAM135 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21363] GAM135 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM135 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM135 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is

meant as an illustration only, and is not meant to be limiting GAM135 RNA may have a different number of target binding sites in untranslated regions of a GAM135 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21364] The complementary binding of GAM135 RNA, herein designated GAM RNA, to target binding sites on GAM135 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM135 target RNA into GAM135 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21365] It is appreciated that GAM135 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM135 target genes. The mRNA of each one of this plurality of GAM135 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM135 RNA, herein designated GAM RNA, and which when bound by GAM135 RNA causes inhibition of translation of respective

one or more GAM135 target proteins.

[21366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM135 gene, herein designated GAM GENE, on one or more GAM135 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21367] It is appreciated that specific functions and accordingly utilities of GAM135 correlate with, and may be deduced from, the identity of the target genes which GAM135 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21368]

[21369]

[21370] Hematopoietic protein 1 (HEM1, Accession NM_005337.1) is a GAM135 target gene, herein designated TARGET GENE. HEM1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HEM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEM1 BINDING SITE, designated SEQ ID:11852, to the nucleotide sequence of GAM135 RNA, herein designated GAM RNA, also designated SEQ ID:248.

[21371] A function of GAM135 is therefore inhibition of Hematopoietic protein 1 (HEM1, Accession NM_005337.1) . Accordingly, utilities of GAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEM1.

[21372] KIAA0652 (Accession NM_014741.1) is another GAM135 target gene, herein designated TARGET GENE. KIAA0652 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0652, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0652 BINDING SITE, designated SEQ ID:11853, to the nucleotide sequence of GAM135 RNA, herein designated GAM RNA, also designated SEQ ID:248.

[21373] Another function of GAM135 is therefore inhibition of KIAA0652 (Accession NM_014741.1) . Accordingly, utilities of GAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652.

[21374] Sema domain, immunoglobulin domain (ig), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 4b (SEMA4B, Accession XM_044533.9) is another GAM135 target gene, herein designated TARGET GENE. SEMA4B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SEMA4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEMA4B BINDING SITE, designated SEQ ID:1258, to the nucleotide sequence of GAM135 RNA, herein designated GAM RNA, also designated SEQ ID:248.

[21375] Another function of GAM135 is therefore inhibition of Sema domain, immunoglobulin domain (ig), transmem-

brane domain (tm) and short cytoplasmic domain, (semaphorin) 4b (SEMA4B, Accession XM_044533.9) . Accordingly, utilities of GAM135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4B.

[21376]

[21377] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 136 (GAM136), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21378] GAM136 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM136 was detected is described hereinabove with reference to Figs. 8-15.

[21379] GAM136 gene, herein designated GAM GENE, and GAM136 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[21380] GAM136 gene encodes a GAM136 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM136 precursor RNA does not encode a protein. A nucleotide sequence

identical or highly similar to the nucleotide sequence of GAM136 precursor RNA is designated SEQ ID:159, and is provided hereinbelow with reference to the sequence listing part.

[21381] GAM136 precursor RNA folds onto itself, forming GAM136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21382] GAM136 precursor RNA folds onto itself, forming GAM136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[21383] Nucleotide sequence of GAM136 precursor RNA, desig-

nated SEQ-ID: 159, and a schematic representation of a predicted secondary folding of GAM136 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[21384] An enzyme complex designated DICER COMPLEX, `dices` the GAM136 folded precursor RNA into GAM136 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM136 RNA is designated SEQ ID:279, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[21385] GAM136 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM136 target RNA, herein designated GAM TARGET RNA. GAM136 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21386] GAM136 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM136 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM136 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM136 RNA may have a different number of target binding sites in untranslated regions of a GAM136 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21387] The complementary binding of GAM136 RNA, herein designated GAM RNA, to target binding sites on GAM136 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, in-

hibits translation of GAM136 target RNA into GAM136 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21388] It is appreciated that GAM136 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM136 target genes. The mRNA of each one of this plurality of GAM136 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM136 RNA, herein designated GAM RNA, and which when bound by GAM136 RNA causes inhibition of translation of respective one or more GAM136 target proteins.

[21389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM136 gene, herein designated GAM GENE, on one or more GAM136 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by

those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21390] It is appreciated that specific functions and accordingly utilities of GAM136 correlate with, and may be deduced from, the identity of the target genes which GAM136 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21391]

[21392]

[21393] AAK1 (Accession NM_014911.2) is a GAM136 target gene, herein designated TARGET GENE. AAK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AAK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AAK1 BINDING SITE, designated SEQ ID:3779, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21394] A function of GAM136 is therefore inhibition of AAK1 (Accession NM_014911.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAK1.

[21395] ABLIM (Accession) is another GAM136 target gene, herein designated TARGET GENE. ABLIM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABLIM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE, designated SEQ ID:19479, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21396] Another function of GAM136 is therefore inhibition of ABLIM (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM.

[21397] Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NM_001609.1) is another GAM136 target gene, herein designated TARGET GENE. ACADSB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACADSB, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:15884, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21398] Another function of GAM136 is therefore inhibition of Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NM_001609.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB.

[21399] Adenylate cyclase 6 (ADCY6, Accession NM_020983.2) is another GAM136 target gene, herein designated TARGET GENE. ADCY6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ADCY6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE, designated SEQ ID:17168, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21400] Another function of GAM136 is therefore inhibition of Adenylate cyclase 6 (ADCY6, Accession NM_020983.2), a gene which this a membrane- bound, ca(2+)- inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6.

[21401] The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.2.Aryl hydrocarbon receptor (AHR, Accession NM_001621.2) is another GAM136 target gene, herein designated TARGET GENE. AHR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AHR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:4473, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21402] Another function of GAM136 is therefore inhibition of Aryl hydrocarbon receptor (AHR, Accession NM_001621.2), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic- metabolizing en-

zymes and therefore may be associated with Stomach tumors. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Stomach tumors, and of other diseases and clinical conditions associated with AHR.

[21403] The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Absent in melanoma 1 (AIM1, Accession XM_166300.1) is another GAM136 target gene, herein designated TARGET GENE. AIM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AIM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AIM1 BINDING SITE, designated SEQ ID:19229, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21404] Another function of GAM136 is therefore inhibition of Absent in melanoma 1 (AIM1, Accession XM_166300.1), a gene which is altered in association with tumor suppression in a model of human melanoma and therefore may be associated with Malignant melanoma. Accordingly, utilities

of GAM136 include diagnosis, prevention and treatment of Malignant melanoma, and of other diseases and clinical conditions associated with AIM1.

[21405] The function of AIM1 has been established by previous studies. Chromosomal segregation during mitosis as well as meiosis is regulated by kinases and phosphatases. The Drosophila 'aurora' and S. cerevisiae Ipl1 serine/threonine protein kinases (STKs) are involved in mitotic events such as centrosome separation and chromosome segregation. Using a degenerate primer- based PCR method to screen for novel STKs, Shindo et al. (1998) isolated mouse and human cDNAs encoding STK12, which they termed ARK2 (aurora- related kinase- 2). Sequence analysis of human STK12 predicted a 344- amino acid protein containing kinase domains that share high homology with the catalytic domains of other STKs. Cell cycle and Northern blot analyses showed that STK12 is expressed in the S phase and persistently thereafter. Western blot analysis indicated that STK12 is localized in the midbodies during anaphase. By FISH and radiation hybrid analysis, Kimura et al. (1998) mapped the STK12 gene to 17p13.1. Tatsuka et al. (1998) noted that the STK12 gene is localized in a region that is frequently deleted in tumors and that contains tumor- re-

lated genes such as p53 (OMIM Ref. No. 191170), CRK (OMIM Ref. No. 164762), and ABR (OMIM Ref. No. 600365). Using interspecific backcross mapping, Shindo et al. (1998) mapped the mouse Stk12 gene to chromosome 11 in a region showing homology of synteny with human 17p.

[21406]

[21407] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21408] Shindo, M.; Nakano, H.; Kuroyanagi, H.; Shirasawa, T.; Mihara, M.; Gilbert, D. J.; Jenkins, N. A.; Copeland, N. G.; Yagita, H.; Okumura, K. : cDNA cloning, expression, subcellular localization, and chromosomal assignment of mammalian aurora homologues, aurora- related kinase (ARK) 1 and 2. Biochem. Biophys. Res. Commun. 244: 285- 292, 1998. ; and

[21410] Further studies establishing the function and utilities of AIM1 are found in John Hopkins OMIM database record ID

606202, and in cited publications listed in Table 5, which are hereby incorporated by reference.APM1 (Accession NM_004797.1) is another GAM136 target gene, herein designated TARGET GENE. APM1 BINDING SITE1 and APM1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APM1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE1 and APM1 BINDING SITE2, designated SEQ ID:10876 and SEQ ID:1915 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21411] Another function of GAM136 is therefore inhibition of APM1 (Accession NM_004797.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[21412] Apolipoprotein l, 2 (APOL2, Accession NM_145637.1) is another GAM136 target gene, herein designated TARGET GENE. APOL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL2 BINDING SITE, designated SEQ ID:3227, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21413] Another function of GAM136 is therefore inhibition of Apolipoprotein l, 2 (APOL2, Accession NM_145637.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL2.

[21414] Amyloid beta precursor protein (cytoplasmic tail) binding protein 2 (APPBP2, Accession NM_006380.2) is another GAM136 target gene, herein designated TARGET GENE. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:15503, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21415] Another function of GAM136 is therefore inhibition of Amyloid beta precursor protein (cytoplasmic tail) binding

protein 2 (APPBP2, Accession NM_006380.2), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore may be associated with Alzheimer's disease. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Alzheimer's disease, and of other diseases and clinical conditions associated with APPBP2.

[21416] The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.APXL2 (Accession) is another GAM136 target gene, herein designated TARGET GENE. APXL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APXL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APXL2 BINDING SITE, designated SEQ ID:12429, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21417] Another function of GAM136 is therefore inhibition of APXL2 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with APXL2.

[21418] Ras homolog gene family, member f (in filopodia) (ARHF, Accession NM_019034.1) is another GAM136 target gene, herein designated TARGET GENE. ARHF BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ARHF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHF BINDING SITE, designated SEQ ID:10691, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21419] Another function of GAM136 is therefore inhibition of Ras homolog gene family, member f (in filopodia) (ARHF, Accession NM_019034.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHF.

[21420] Ankyrin repeat and socs box-containing 16 (ASB16, Accession NM_080863.4) is another GAM136 target gene, herein designated TARGET GENE. ASB16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASB16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:16106, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21421] Another function of GAM136 is therefore inhibition of Ankyrin repeat and socs box-containing 16 (ASB16, Accession NM_080863.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16.

[21422] Atpase, h+ transporting, lysosomal 70kda, v1 subunit a, isoform 1 (ATP6V1A1, Accession NM_001690.2) is another GAM136 target gene, herein designated TARGET GENE. ATP6V1A1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ATP6V1A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V1A1 BINDING SITE, designated SEQ ID:2154, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21423] Another function of GAM136 is therefore inhibition of Atpase, h+ transporting, lysosomal 70kda, v1 subunit a, isoform 1 (ATP6V1A1, Accession NM_001690.2), a gene which is responsible for acidifying a variety of intracellular compartments in eukaryotic cells. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1A1.

[21424] The function of ATP6V1A1 has been established by previous studies. Van Hille et al. (1993) cloned a partial cDNA clone for an A subunit isoform, which they designated VA68, from a human osteoclastoma tumor cDNA library by PCR using degenerate primers based on the bovine sequence. They obtained a full- length clone from a genomic library. The deduced 617- amino acid protein has a predicted molecular mass of about 68 kD and shows 99% sequence identity with the bovine brain subunit A. Northern blot analysis revealed ubiquitous expression of a ma-

jor 4.8- kb band and a minor 3.4- kb band. They also identified a variant, which they designated HO68, encoding a 615- amino acid protein. By RNase protection assays and in situ hybridization, van Hille et al. (1995) determined that expression of the HO68 variant was specific to the osteoclastoma originally used to construct the cDNA library.

[21425]

[21426] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21427] van Hille, B.; Richener, H.; Evans, D. B.; Green, J. R.; Bilbe, G. : Identification of two subunit A isoforms of the vacuolar H(+)- ATPase in human osteoclastoma. J. Biol. Chem. 268: 7075- 7080, 1993. ; and

[21428] van Hille, B.; Richener, H.; Green, J. R.; Bilbe, G. : The ubiquitous VA68 isoform of subunit A of the vacuolar H(+)- ATPase is highly expressed in human osteoclasts. Biochem. Biophys.

[21429] Further studies establishing the function and utilities of ATP6V1A1 are found in John Hopkins OMIM database record ID 607027, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atpase,

cu++ transporting, alpha polypeptide (menkes syndrome) (ATP7A, Accession NM_000052.1) is another GAM136 target gene, herein designated TARGET GENE. ATP7A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:12838, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21430] Another function of GAM136 is therefore inhibition of Atpase, cu++ transporting, alpha polypeptide (menkes syndrome) (ATP7A, Accession NM_000052.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A.

[21431] Atpase, class i, type 8b, member 2 (ATP8B2, Accession XM_290875.1) is another GAM136 target gene, herein designated TARGET GENE. ATP8B2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ATP8B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:8818, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21432] Another function of GAM136 is therefore inhibition of Atpase, class i, type 8b, member 2 (ATP8B2, Accession XM_290875.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2.

[21433] Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 5 (B4GALT5, Accession NM_004776.2) is another GAM136 target gene, herein designated TARGET GENE. B4GALT5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B4GALT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:16556, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21434] Another function of GAM136 is therefore inhibition of

Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 5 (B4GALT5, Accession NM_004776.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5.

[21435] BA108L7.2 (Accession NM_030971.1) is another GAM136 target gene, herein designated TARGET GENE. BA108L7.2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BA108L7.2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:411, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21436] Another function of GAM136 is therefore inhibition of BA108L7.2 (Accession NM_030971.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2.

[21437] B-cell cll/lymphoma 10 (BCL10, Accession NM_003921.2) is another GAM136 target gene, herein designated TARGET GENE. BCL10 BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by BCL10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL10 BINDING SITE, designated SEQ ID:5479, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21438] Another function of GAM136 is therefore inhibition of B-cell cll/lymphoma 10 (BCL10, Accession NM_003921.2), a gene which is a positive regulator of lymphocyte proliferation, NF- kappaB activator. and therefore may be associated with Malt lymphoma, follicular lymphoma. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Malt lymphoma, follicular lymphoma, and of other diseases and clinical conditions associated with BCL10.

[21439] The function of BCL10 has been established by previous studies. B- cell lymphomas of mucosa- associated lymphoid tissue (MALT lymphomas) are the most common form of lymphoma arising in extranodal sites, in most cases arising in the gastric mucosa (Isaacson and Spencer, 1995). Cytogenetic studies of low- grade malignant MALT lymphoma identified abnormalities of chromosome 1p22,

in particular translocation t(1;14)(p22;q32), as uncommon but recurrent events (Wotherspoon et al., 1992). Willis et al. (1999) cloned a t(1;14)(p22;q32) translocation breakpoint from a case of low- grade MALT lymphoma and identified a recurrent breakpoint upstream of the promoter of a novel gene, BCL10. The BCL10 gene encodes a predicted protein of 233 amino acids and is a cellular homolog of the equine herpesvirus- 2 gene (E10); both contain an amino- terminal caspase recruitment domain (CARD) homologous to that found in several apoptotic molecules. BCL10 was found to be expressed as a transcript of 4.2 kb in all normal and malignant tissues examined. BCL10 and E10 activated nuclear factor kappa- B (NFKB; 164011) but caused apoptosis of 293 cells. BCL10 expressed in a MALT lymphoma exhibited a frameshift mutation resulting in truncation distal to the CARD. Truncated BCL10 activated NFKB but did not induce apoptosis. Wildtype BCL10 suppressed transformation, whereas mutant forms had lost this activity and displayed gain- of- function transforming activity.

[21440] Animal model experiments lend further support to the function of BCL10. Ruland et al. (2001) showed that one- third of Bcl10 - /- mouse embryos developed exen-

cephaly, leading to embryonic lethality. Surprisingly, Bcl10 - /- cells retained susceptibility to various apoptotic stimuli in vivo and in vitro. However, surviving Bcl10 - /- mice were severely immunodeficient, and Bcl10 - /- lymphocytes were defective in antigen receptor or phorbol myristate acetate (PMA)/ionomycin- induced activation. Early tyrosine phosphorylation, mitogen- activated protein kinase (MAPK; OMIM Ref. No. 604921) and activator protein- 1 (AP1; 165160) activation, and calcium signaling were normal in mutant lymphocytes, but antigen receptor- induced NFKB activation was absent. Thus, the authors concluded that BCL10 functions as a positive regulator of lymphocyte proliferation that specifically connects antigen receptor signaling in B and T cells to NFKB activation.

[21441] It is appreciated that the abovementioned animal model for BCL10 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[21442] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21443] Willis, T. G.; Jadayel, D. M.; Du, M.- Q.; Peng, H.; Perry, A.

R.; Abdul- Rauf, M.; Price, H.; Karran, L.; Majekodunmi, O.; Wlodarska, I.; Pan, L.; Crook, T.; Hamoudi, R.; Isaacson, P. G.; Dyer, M. J. S. : Bcl10 is involved in t(1;14)(p22;q32) of MALT B cell lymphoma and mutated in multiple tumor types Cell 96: 35- 45, 1999. ; and

[21444] Ruland, J.; Duncan, G. S.; Elia, A.; del Barco Barrantes, I.; Nguyen, L.; Plyte, S.; Millar, D. G.; Bouchard, D.; Wakeham, A.; Ohashi, P. S.; Mak, T. W. : Bcl10 is a positive regulator.

[21445] Further studies establishing the function and utilities of BCL10 are found in John Hopkins OMIM database record ID 603517, and in cited publications listed in Table 5, which are hereby incorporated by reference.Bradykinin receptor b1 (BDKRB1, Accession NM_000710.2) is another GAM136 target gene, herein designated TARGET GENE. BDKRB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BDKRB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BDKRB1 BINDING SITE, designated SEQ ID:3577, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21446] Another function of GAM136 is therefore inhibition of

Bradykinin receptor b1 (BDKRB1, Accession NM_000710.2), a gene which mediates intracellular calcium flux. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDKRB1.

[21447] The function of BDKRB1 has been established by previous studies. where activation of B2 receptors causes pronounced hypotension, bronchoconstriction, pain, and inflammation. Menke et al. (1994) isolated a cDNA clone encoding a human B1 bradykinin receptor from a human embryonic lung fibroblast cDNA library by expression cloning. An open reading frame encoding a 353- amino acid protein with the characteristics of a G protein- coupled receptor was found. Its amino acid sequence was 36% identical to that of the B2 bradykinin receptor (OMIM Ref. No. 113503). The expressed receptor had the pharmacologic characteristics of the B1 receptor subtype. The B1 receptor is synthesized de novo following tissue injury and mediates hyperalgesia in animal models of chronic inflammation. Yang and Polgar (1996) isolated the human B1 bradykinin receptor gene from a human lung fibroblast genomic DNA library. They found 2 differences between their coding sequence and that which was obtained by

Menke et al. (1994): an A- to- C exchange at nucleotide position 2897 leading to replacement of arginine- 246 with serine and a C- to- T exchange at position 3025 which converts serine- 259 to phenylalanine. Using luciferase activity assays, Yang and Polgar (1996) found 2 promoters for the human BDKRB1 gene. The first is a 451- bp fragment located in the 5- prime flanking region and the second is a 812- bp fragment found in the intron II region. The intron II region promoter showed a 10- fold decrease in luciferase activity relative to the 5- prime flanking region promoter. Yang and Polgar (1996) mapped the transcriptional initiation site of the BDKRB1 gene at 21 bp downstream of the TATA box. This site is 12 bp longer than that of the 5- prime untranslated region sequence published by MacNeil et al. (1995). In addition, 2 inverted orientation Alu repeats were found in the BDKRB1 gene.

[21448]

[21449] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21450] Menke, J. G.; Borkowski, J. A.; Bierilo, K. K.; MacNeil, T.; Derrick, A. W.; Schneck, K. A.; Ransom, R. W.; Strader, C. D.; Linemeyer, D. L.; Hess, J. F. : Expression cloning of a

human B1 bradykinin receptor. J. Biol. Chem. 269: 21583-21586, 1994. ; and

[21451] Yang, X.; Polgar, P. : Genomic structure of the human bradykinin B(1) receptor gene and preliminary characterization of its regulatory regions. Biochem. Biophys. Res. Commun. 222: 718- 72.

[21452] Further studies establishing the function and utilities of BDKRB1 are found in John Hopkins OMIM database record ID 600337, and in cited publications listed in Table 5, which are hereby incorporated by reference.Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession NM_007048.2) is another GAM136 target gene, herein designated TARGET GENE. BTN3A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BTN3A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:17443, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21453] Another function of GAM136 is therefore inhibition of Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession

NM_007048.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1.

[21454] Chromosome 14 open reading frame 1 (C14orf1, Accession NM_007176.1) is another GAM136 target gene, herein designated TARGET GENE. C14orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:15476, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21455] Another function of GAM136 is therefore inhibition of Chromosome 14 open reading frame 1 (C14orf1, Accession NM_007176.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1.

[21456] Chromosome 22 open reading frame 19 (C22orf19, Accession NM_003678.2) is another GAM136 target gene, herein designated TARGET GENE. C22orf19 BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by C22orf19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:8914, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21457] Another function of GAM136 is therefore inhibition of Chromosome 22 open reading frame 19 (C22orf19, Accession NM_003678.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19.

[21458] Chromosome 5 open reading frame 4 (C5orf4, Accession NM_032385.1) is another GAM136 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by C5orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:7970, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21459] Another function of GAM136 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NM_032385.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[21460] C6orf5 (Accession) is another GAM136 target gene, herein designated TARGET GENE. C6orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:18128, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21461] Another function of GAM136 is therefore inhibition of C6orf5 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5.

[21462] Chromosome 9 open reading frame 9 (C9orf9, Accession NM_018956.2) is another GAM136 target gene, herein designated TARGET GENE. C9orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by C9orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:8425, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21463] Another function of GAM136 is therefore inhibition of Chromosome 9 open reading frame 9 (C9orf9, Accession NM_018956.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9.

[21464] Caspase recruitment domain family, member 6 (CARD6, Accession NM_032587.2) is another GAM136 target gene, herein designated TARGET GENE. CARD6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CARD6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CARD6 BINDING SITE, designated SEQ ID:5983, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21465] Another function of GAM136 is therefore inhibition of

Caspase recruitment domain family, member 6 (CARD6, Accession NM_032587.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD6.

[21466] Ccr4 carbon catabolite repression 4-like (s. cerevisiae) (CCRN4L, Accession NM_012118.1) is another GAM136 target gene, herein designated TARGET GENE. CCRN4L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCRN4L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCRN4L BINDING SITE, designated SEQ ID:1330, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21467] Another function of GAM136 is therefore inhibition of Ccr4 carbon catabolite repression 4-like (s. cerevisiae) (CCRN4L, Accession NM_012118.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRN4L.

[21468] Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NM_033332.1) is another GAM136

target gene, herein designated TARGET GENE. CDC14B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:13617, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21469] Another function of GAM136 is therefore inhibition of Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NM_033332.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B.

[21470] Carcinoembryonic antigen-related cell adhesion molecule 8 (CEACAM8, Accession NM_001816.2) is another GAM136 target gene, herein designated TARGET GENE. CEACAM8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CEACAM8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CEACAM8 BINDING SITE, designated SEQ ID:3822, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21471] Another function of GAM136 is therefore inhibition of Carcinoembryonic antigen-related cell adhesion molecule 8 (CEACAM8, Accession NM_001816.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM8.

[21472] Chromatin accessibility complex 1 (CHRAC1, Accession NM_017444.3) is another GAM136 target gene, herein designated TARGET GENE. CHRAC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHRAC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:14719, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21473] Another function of GAM136 is therefore inhibition of Chromatin accessibility complex 1 (CHRAC1, Accession

NM_017444.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1.

[21474] C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NM_022570.2) is another GAM136 target gene, herein designated TARGET GENE. CLECSF12 BINDING SITE1 and CLECSF12 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CLECSF12, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE1 and CLECSF12 BINDING SITE2, designated SEQ ID:14434 and SEQ ID:10748 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21475] Another function of GAM136 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NM_022570.2), a gene which is a pattern- recognition receptor . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CLECSF12.

[21476] The function of CLECSF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Calponin 2 (CNN2, Accession NM_004368.1) is another GAM136 target gene, herein designated TARGET GENE. CNN2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CNN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNN2 BINDING SITE, designated SEQ ID:7340, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21477] Another function of GAM136 is therefore inhibition of Calponin 2 (CNN2, Accession NM_004368.1), a gene which may be involved in the structural organization and/or anchorage of actin filaments. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNN2.

[21478] The function of CNN2 has been established by previous studies. Masuda et al. (1996) cloned a cDNA encoding calponin- 2 (CNN2) by screening a human heart cDNA li-

brary with a CNN1 (OMIM Ref. No. 600806) cDNA. The CNN2 protein is 94.8% identical to mouse calponin h2 (see OMIM Ref. No. 600806), indicating that these proteins are homologs. The predicted CNN2 protein has 309 amino acids and a pI of 7.1. It contains motifs that are present in CNN1 and CNN3 (OMIM Ref. No. 602374): 3 tandem repeats of 29 amino acids, an actin- binding domain, a VAV (OMIM Ref. No. 164875)- homologous region, and 2 consensus phosphorylation sites for tyrosine kinase at the C terminus. The 3- prime untranslated region of the CNN2 mRNA contains an Alu repetitive sequence in the antisense direction. RT- PCR detected CNN2 transcripts in both cultured smooth muscle and nonmuscle cells and showed that mouse calponin h2 is expressed in embryonic and adult heart. CNN2 protein localizes to the cell- to-cell junctions of cardiomyocytes and codistributes with vinculin (OMIM Ref. No. 193065). Masuda et al. (1996) suggested that CNN2 may be involved in the structural organization and/or anchorage of actin filaments and may function in the cell adhesion mechanism Cheng et al. (1994) mapped the CNN2 gene to 21q11.1 by hybridization to chromosome 21q- specific YACs.

[21479]

[21480] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21481] Masuda, H.; Tanaka, K.; Takagi, M.; Ohgami, K.; Sakamaki, T.; Shibata, N.; Takahashi, K. : Molecular cloning and characterization of human non- smooth muscle calponin. J. Biochem. 120: 415- 424, 1996. ; and

[21482] Cheng, J.- F.; Boyartchuk, V.; Zhu, Y. : Isolation and mapping of human chromosome 21 cDNA: progress in constructing a chromosome 21 expression map. Genomics 23: 75- 84, 1994.

[21483] Further studies establishing the function and utilities of CNN2 are found in John Hopkins OMIM database record ID 602373, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XM_029311.2) is another GAM136 target gene, herein designated TARGET GENE. CPSF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE,

designated SEQ ID:5334, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21484] Another function of GAM136 is therefore inhibition of Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XM_029311.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2.

[21485] Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NM_000651.3) is another GAM136 target gene, herein designated TARGET GENE. CR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CR1 BINDING SITE, designated SEQ ID:17680, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21486] Another function of GAM136 is therefore inhibition of Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NM_000651.3)

. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CR1.

[21487] Cartilage associated protein (CRTAP, Accession NM_006371.2) is another GAM136 target gene, herein designated TARGET GENE. CRTAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRTAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:18368, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21488] Another function of GAM136 is therefore inhibition of Cartilage associated protein (CRTAP, Accession NM_006371.2), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP.

[21489] The function of CRTAP has been established by previous studies. Castagnola et al. (1997) isolated a mouse Crtap cDNA from a subtracted library specific for mRNAs highly

expressed in hypertrophic chondrocytes compared to proliferating and early differentiating chondrocytes. Using a mouse Crtap clone to screen a human fetal brain cDNA library, Tonachini et al. (1999) identified human CRTAP cDNA clones. Human CRTAP encodes a deduced 401-amino acid protein with a a putative signal peptide of 26 amino acids. CRTAP contains 2 potential N- glycosylation signals. CRTAP shares 89% amino acid sequence identity with mouse Crtap and 51% identity with the chick homolog. The mouse and human genes contain a C- terminal region of approximately 120 amino acids not present in the chick protein Using Northern blot analysis of human tissues, Tonachini et al. (1999) detected 2- kb and 4- kb CRTAP transcripts in brain, heart, kidney, lung, small intestine, and skeletal muscle. In all tissues except brain, the 2- kb transcript was more abundant. Using immunohistochemistry, the authors detected CRTAP expression in articular chondrocytes. In mouse, Morello et al. (1999) detected 3 Crtap transcripts in a range of tissues, including all mouse embryonic cartilages. In chick, Castagnola et al. (1997) detected a single Crtap transcript in a broad range of embryonic tissues with the strongest expression in the developing cartilage. They detected expression in the ex-

tracellular matrix of the forming cartilage surrounding the notochord, the developing sclera, the sphenoid and mandibular cartilage, the long bone cartilage, and the developing sternal cartilage

[21490]

[21491] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21492] Castagnola, P.; Gennari, M.; Morello, R.; Tonachini, L.; Marin, O.; Gaggero, A.; Cancedda, R. : Cartilage associated protein (CASP) is a novel developmentally regulated chick embryo protein. J. Cell Sci. 110: 1351- 1359, 1997. ; and

[21493] Morello, R.; Tonachini, L.; Monticone, M.; Viggiano, L.; Rocchi, M.; Cancedda, R.; Castagnola, P. : cDNA cloning, characterization and chromosome mapping of Crtap encoding the mouse carti.

[21494] Further studies establishing the function and utilities of CRTAP are found in John Hopkins OMIM database record ID 605497, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession NM_000761.2) is another GAM136 target gene, herein designated TARGET

GENE. CYP1A2 BINDING SITE1 and CYP1A2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CYP1A2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE1 and CYP1A2 BINDING SITE2, designated SEQ ID:414 and SEQ ID:6233 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21495] Another function of GAM136 is therefore inhibition of Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession NM_000761.2), a gene which intervenes in an NADPH-dependent electron transport pathway. and therefore may be associated with Porphyria cutanea tarda. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Porphyria cutanea tarda, and of other diseases and clinical conditions associated with CYP1A2.

[21496] The function of CYP1A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Debranching enzyme homolog 1 (s. cere-

visiae) (DBR1, Accession NM_016216.1) is another GAM136 target gene, herein designated TARGET GENE. DBR1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DBR1 BINDING SITE, designated SEQ ID:3140, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21497] Another function of GAM136 is therefore inhibition of Debranching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NM_016216.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBR1.

[21498] DCOHM (Accession NM_032151.2) is another GAM136 target gene, herein designated TARGET GENE. DCOHM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:2472, to the nu-

cleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21499] Another function of GAM136 is therefore inhibition of DCOHM (Accession NM_032151.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM.

[21500] Dna fragmentation factor, 40kda, beta polypeptide (caspase-activated dnase) (DFFB, Accession NM_004402.1) is another GAM136 target gene, herein designated TARGET GENE. DFFB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DFFB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:1322, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21501] Another function of GAM136 is therefore inhibition of Dna fragmentation factor, 40kda, beta polypeptide (caspase-activated dnase) (DFFB, Accession NM_004402.1), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accord-

ingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB.

[21502] The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.DKFZp547H025 (Accession NM_020161.1) is another GAM136 target gene, herein designated TARGET GENE. DKFZp547H025 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547H025, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:5775, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21503] Another function of GAM136 is therefore inhibition of DKFZp547H025 (Accession NM_020161.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025.

[21504] DKFZP564D166 (Accession NM_030658.2) is another

GAM136 target gene, herein designated TARGET GENE. DKFZP564D166 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP564D166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564D166 BINDING SITE, designated SEQ ID:2023, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21505] Another function of GAM136 is therefore inhibition of DKFZP564D166 (Accession NM_030658.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D166.

[21506] DKFZP564K0322 (Accession NM_032040.1) is another GAM136 target gene, herein designated TARGET GENE. DKFZP564K0322 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K0322, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564K0322 BINDING SITE,

designated SEQ ID:17506, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21507] Another function of GAM136 is therefore inhibition of DKFZP564K0322 (Accession NM_032040.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K0322.

[21508] DKFZp761N1114 (Accession XM_086327.6) is another GAM136 target gene, herein designated TARGET GENE. DKFZp761N1114 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:6234, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21509] Another function of GAM136 is therefore inhibition of DKFZp761N1114 (Accession XM_086327.6) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp761N1114.

[21510] DKFZp761O0113 (Accession NM_018409.1) is another GAM136 target gene, herein designated TARGET GENE. DKFZp761O0113 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761O0113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761O0113 BINDING SITE, designated SEQ ID:14313, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21511] Another function of GAM136 is therefore inhibition of DKFZp761O0113 (Accession NM_018409.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O0113.

[21512] Down syndrome critical region gene 6 (DSCR6, Accession NM_018962.1) is another GAM136 target gene, herein designated TARGET GENE. DSCR6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:14099, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21513] Another function of GAM136 is therefore inhibition of Down syndrome critical region gene 6 (DSCR6, Accession NM_018962.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR6.

[21514] EPB72 (Accession) is another GAM136 target gene, herein designated TARGET GENE. EPB72 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EPB72, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:5774, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21515] Another function of GAM136 is therefore inhibition of EPB72 (Accession), a gene which may regulate cation conductance. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with EPB72.

[21516] The function of EPB72 has been established by previous studies. Erythrocyte surface protein band 7.2 is a 29,000-kD integral membrane protein that is exposed on the cytoplasmic surface of the membrane and is susceptible to phosphorylation by a cAMP- dependent protein kinase. Deficiency of this protein in red cells is responsible for stomatocytosis (OMIM Ref. No. 185000). The same protein can be demonstrated in human cell lines of epithelial and lymphoid origin, notably in HeLa cells. Hiebl- Dirschmied et al. (1991), therefore, could screen HeLa cell cDNA expression libraries with antibodies to the protein in order to isolate cDNA clones, determine the nucleotide sequence, and study the structure of the protein. HeLa and bone marrow cell- derived sequences were identical, except for one nucleotide; the deduced sequence of 287 amino acids was confirmed by sequence identity with peptides of the erythroid protein. Structural analysis assigned band 7 protein to the type Ib transmembrane proteins. Westberg et al. (1993) used a cDNA clone coding for stomatin to determine the chromosomal localization of the EPB72 gene. They assigned the gene to human chromosome 9 by Southern blot analysis of somatic cell hy-

brids. By analysis of hybrid cells containing only parts of chromosome 9, they regionalized the assignment to 9q34.1, proximal to the breakpoint that creates the Philadelphia chromosome of chronic myeloid leukemia (CML; 151410) and, therefore, proximal to the Abelson oncogene (OMIM Ref. No. 189980). Using fluorescence in situ hybridization, Gallagher et al. (1993) likewise mapped the EPB72 gene to 9q33- q34. They showed that EPB72 was not translocated with the 3- prime end of the ABL gene in the Philadelphia chromosome, suggesting that the EPB72 gene is centromeric to the ABL gene. Pilz et al. (1994) demonstrated that the homologous gene is located on mouse chromosome 2. To gain additional insight into the structure and function of this protein, Gallagher et al. (1995) cloned the mouse band 7.2b cDNA and studied its tissue- specific expression. They isolated 2,873 bp of cDNA with an open reading frame of 852 bp. The predicted protein was 284 amino acids with a molecular weight of 31 kD. They detected a wide pattern of expression, with high levels of mRNA in heart, liver, skeletal muscle, and testis but low levels in lung, brain, and spleen. Using fluorescence in situ hybridization, the murine band 7.2b gene was mapped to chromosome 2, at

the border of the distal region of 2B and proximal region of C1, syntenic to 9q, the location of the human homolog. Models of the predicted protein structure showed a short NH2- terminal head, a strongly hydrophobic 28- amino acid stretch presumably encoding a single membrane-spanning domain, and a large domain composed of beta sheet and alpha helix. Database searching showed no significant homology of other known proteins to either the human or the murine band 7.2b. Gallagher and Forget (1995) determined the sequence of the full- length human band 7.2b cDNA, characterized the genomic structure of the EPB72 gene, studied its pattern of expression in different tissues, and characterized the promoter of the gene. The gene is composed of 7 exons distributed over 40 kb of DNA. Its promoter was identified as lacking a TATA box and to be GC- rich. It directed high- level expression of a reporter gene in both erythroid and non-erythroid cells. Unfried et al. (1995) showed that the human EPB72 gene contains 7 exons spanning about 30 kb. Two polyadenylation signals were found in the 3- prime UTR accounting for the 3.2- and 3.3- kb RNAs that are observed in Northern blots.

[21517] Animal model experiments lend further support to the

function of EPB72. To examine the relationship between erythrocyte membrane protein 7.2b deficiency and the hemolytic anemia of human hereditary stomatocytosis, Zhu et al. (1999) created 7.2b knockout mice by standard gene targeting approaches. Despite a complete absence of protein 7.2b in homozygous knockout mice, there was no hemolytic anemia, and mouse red blood cells were normal in morphology, cell indices, hydration status, monovalent cation content, and ability to translocate lipids. Thus, their experiments suggested that 7.2b deficiency plays no direct role in the etiology of stomatocytosis and excluded any role of this protein as a mediator of cation transport in red blood cells.

[21518] It is appreciated that the abovementioned animal model for EPB72 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[21519] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21520] Zhu, Y.; Paszty, C.; Turetsky, T.; Tsai, S.; Kuypers, F. A.; Lee, G.; Cooper, P.; Gallagher, P. G.; Stevens, M. E.; Rubin, E.; Mohandas, N.; Mentzer, W. C. : Stomatocytosis is ab-

sent in 'stomatin'- deficient murine red blood cells. Blood 93: 2404- 2410, 1999. ; and

[21521] Zhu, Y.; Paszty, C.; Turetsky, T.; Tsai, S.; Kuypers, F. A.; Lee, G.; Cooper, P.; Gallagher, P. G.; Stevens, M. E.; Rubin, E.; Mohandas, N.; Mentzer, W. C. : Stomatocytosis is absent in.

[21522] Further studies establishing the function and utilities of EPB72 are found in John Hopkins OMIM database record ID 133090, and in cited publications listed in Table 5, which are hereby incorporated by reference.Coagulation factor ii (thrombin) receptor-like 2 (F2RL2, Accession NM_004101.1) is another GAM136 target gene, herein designated TARGET GENE. F2RL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F2RL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F2RL2 BINDING SITE, designated SEQ ID:13299, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21523] Another function of GAM136 is therefore inhibition of Coagulation factor ii (thrombin) receptor-like 2 (F2RL2, Ac-

cession NM_004101.1), a gene which receptor for activated thrombin coupled to g proteins that stimulate phosphoinositide hydrolysis. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL2.

[21524] The function of F2RL2 has been established by previous studies. Thrombin (OMIM Ref. No. 176930) is a coagulation protease that activates platelets, leukocytes, and endothelium and mesenchymal cells at sites of vascular injury, acting partly through an unusual proteolytically activated G protein- coupled receptor, coagulation factor II (thrombin) receptor (CF2R; 187930). Thrombin triggers cellular responses through protease- activated receptors (PARs), of which PAR3 is one. It is thought that PAR3 functions as a cofactor for the cleavage and activation of PAR4 (OMIM Ref. No. 602779) by thrombin (Nakanishi- Matsui et al., 2000; Sambrano et al, 2001). Using a PCR- based strategy, Ishihara et al. (1997) isolated a human cDNA encoding a putative G protein- coupled receptor with 27% amino acid sequence similarity to CF2R, which they referred to as PAR1 (OMIM Ref. No. 107930), and 28% similarity to PAR2 (OMIM Ref. No. 600933). PAR2 is a possible trypsin receptor. The N- terminal exodomain of the new

receptor, designated PAR3 by the investigators, contains a possible thrombin cleavage site at residues lys38/thr39, followed by a sequence strikingly identical to a thrombin-binding sequence in the leech anticoagulant hirudin. Ishihara et al. (1997) showed that PAR3 mediates thrombin-triggered phosphoinositide hydrolysis and is expressed in a variety of tissues, including human bone marrow and mouse megakaryocytes, making it a candidate for the sought- after second platelet thrombin receptor. They commented that PAR3 provides a new tool for understanding thrombin signaling and a possible target for therapeutics designed selectively to block thrombotic, inflammatory, and proliferative responses to thrombin. The human PAR1, PAR2, and PAR3 (Schmidt et al., 1997) genes were cloned and localized to 5q13, by in situ hybridization or use of radiation hybrid panels.

[21525] Animal model experiments lend further support to the function of F2RL2. Kahn et al. (1998) generated mice deficient in Par3 by targeted disruption. Thrombin responses in platelets from these mice were markedly delayed and diminished but not absent.

[21526] It is appreciated that the abovementioned animal model for F2RL2 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[21527] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21528] Sambrano, G. R.; Weiss, E. J.; Zheng, Y.- W.; Huang, W.; Coughlin, S. R. : Role of thrombin signalling in platelets in haemostasis and thrombosis. Nature 413: 74- 78, 2001. ; and

[21529] Ishihara, H.; Connolly, A. J.; Zeng, D.; Kahn, M. L.; Zheng, Y. W.; Timmons, C.; Tram, T.; Coughlin, S. R. : Protease-activated receptor 3 is a second thrombin receptor in humans. Natur.

[21530] Further studies establishing the function and utilities of F2RL2 are found in John Hopkins OMIM database record ID 601919, and in cited publications listed in Table 5, which are hereby incorporated by reference.Coagulation factor iii (thromboplastin, tissue factor) (F3, Accession NM_001993.2) is another GAM136 target gene, herein designated TARGET GENE. F3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F3 BINDING SITE, designated SEQ ID:5697, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21531] Another function of GAM136 is therefore inhibition of Coagulation factor iii (thromboplastin, tissue factor) (F3, Accession NM_001993.2), a gene which functions in normal hemostasis. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F3.

[21532] The function of F3 has been established by previous studies. Factor III, a glycoprotein component of cell membranes, is an essential cofactor for factor VII- dependent activation of blood coagulation and activates the extrinsic pathway of blood coagulation in the presence of factor XII and calcium. It may be the primary physiologic initiator of blood coagulation. This may explain why factor III is the only protein in the coagulation pathway for which a congenital deficiency has not been described. Carson et al. (1985) mapped F3 to 1pter- p21 by study of somatic cell hybrids with a species- specific sensitive chromogenic assay. Spicer et al. (1987) isolated cDNA clones for tissue factor. The amino acid sequence deduced from the nu-

cleotide sequence of the cDNAs indicates that tissue factor is synthesized as a higher molecular weight precursor with a leader sequence of 32 amino acids, while the sequence of the mature protein suggests that there are 3 distinct domains: extracellular (residues 1- 219), hydrophobic (residues 220- 242), and cytoplasmic (residues 243- 263). Scarpati et al. (1987) screened a human placenta cDNA library in lambda- gt11 for expression of tissue factor antigens. Among 4 million recombinant clones screened, one that was positive expressed a protein that shares epitopes with authentic human brain tissue factor. The 1.1- kb cDNA insert encodes a peptide containing the N- terminal protein sequence of brain tissue factor. By means of this clone used in hybridization to flow- sorted human chromosomes, Scarpati et al. (1987) showed that the tissue factor gene is located on chromosome 1. Scarpati et al. (1987) used a RFLP to map factor 3 to proximal 1p by multipoint linkage analysis with probes known to span that region. Judging by the location arrived at by somatic cell hybridization, the location of F3 may be in the region 1p22- p21. By in situ hybridization, Kao et al. (1988) likewise mapped F3 to 1p22- p21. Mackman et al. (1989) presented the complete sequence of the F3 gene. It

is 12.4 kb long and has 6 exons separated by 5 introns. Mackman et al. (1990) concluded that the tissue factor promoter is relatively complex. Tissue factor (TF) is an integral membrane glycoprotein that, when exposed to plasma, is a potent procoagulant. As stated earlier, it is believed to be the physiologic initiator of blood coagulation. Toomey et al. (1997) found that, in contrast to findings of earlier studies which showed that TF- null mouse embryos did not survive beyond midgestation, 14% of TF-deficient embryos from a hybrid background escaped this early mortality and survived to birth. On gross and microscopic inspection, these late gestation, TF- deficient embryos appeared normal. Furthermore, the growth and vascularity of TF +/+, TF +/-, and TF - /- teratomas and teratocarcinomas were indistinguishable. Toomey et al. (1997) concluded that tumor- derived TF is not required for tumor growth and angiogenesis and that the combined data do not support an essential role for TF in embryonic vascular development.

[21533]

[21534] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21535] Mackman, N.; Fowler, B. J.; Edgington, T. S.; Morrissey, J. H. : Functional analysis of the human tissue factor promoter and induction by serum. Proc. Nat. Acad. Sci. 87: 2254- 2258, 1990. ; and

[21536] Toomey, J. R.; Kratzer, K. E.; Lasky, N. M.; Broze, G. J., Jr. : Effect of tissue factor deficiency on mouse and tumor development. Proc. Nat. Acad. Sci. 94: 6922- 6926, 1997.

[21537] Further studies establishing the function and utilities of F3 are found in John Hopkins OMIM database record ID 134390, and in cited publications listed in Table 5, which are hereby incorporated by reference.FBP17 (Accession) is another GAM136 target gene, herein designated TARGET GENE. FBP17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FBP17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:13681, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21538] Another function of GAM136 is therefore inhibition of FBP17 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with FBP17.

[21539] Fc fragment of iga, receptor for (FCAR, Accession NM_002000.2) is another GAM136 target gene, herein designated TARGET GENE. FCAR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FCAR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE, designated SEQ ID:14197, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21540] Another function of GAM136 is therefore inhibition of Fc fragment of iga, receptor for (FCAR, Accession NM_002000.2), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. and therefore may be associated with Iga nephropathy. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Iga nephropathy., and of other diseases and clinical conditions associated with FCAR.

[21541] The function of FCAR has been established by previous studies. Human Fc- alpha receptor (FCAR) is present on a

number of cell types, including neutrophils, monocytes, macrophages, and eosinophils. FCAR interacts with aggregated IgAs, such as IgA coated on the surface of an invading microorganism, and mediates several immunologic defense processes such as phagocytosis, antibody- dependent cell- mediated cytotoxicity, and stimulation of the release of inflammatory mediators. FCAR is a glycoprotein of 50 to 100 kD, with diversity on different cell types. Narita et al. (2001) examined polymorphisms in the promoter and 5- prime untranslated region of the FCAR gene in 151 patients with IgA nephropathy and 163 patients with other glomerular diseases shown to have no mesangial IgA deposition by renal biopsy. Haplotype analysis showed tight linkage disequilibrium among the polymorphisms. No significant association for the genotype, allele, and haplotype frequencies of the polymorphisms were shown between the patients with histologically proven IgA nephropathy and those with other glomerular diseases. Thus, the analyzed polymorphisms did not appear to be primarily involved in susceptibility to IgA nephropathy.

[21542]

[21543] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[21544] Narita, I.; Goto, S.; Saito, N.; Sakatsume, M.; Jin, S.; Omori, K.; Gejyo, F. : Genetic polymorphisms in the promoter and 5- prime UTR region of the Fc alpha receptor (CD89) are not associated with a risk of IgA nephropathy. J. Hum. Genet. 46: 694- 698, 2001. ; and

[21545] Maliszewski, C. R.; March, C. J.; Schoenborn, M. A.; Gimpel, S.; Shen, L. : Expression cloning of a human Fc receptor for IgA. J. Exp. Med. 172: 1665- 1672, 1990.

[21546] Further studies establishing the function and utilities of FCAR are found in John Hopkins OMIM database record ID 147045, and in cited publications listed in Table 5, which are hereby incorporated by reference.FCRH1 (Accession NM_052938.2) is another GAM136 target gene, herein designated TARGET GENE. FCRH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FCRH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCRH1 BINDING SITE, designated SEQ ID:11769, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ

ID:279.

[21547] Another function of GAM136 is therefore inhibition of FCRH1 (Accession NM_052938.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCRH1.

[21548] Fer-1-like 4 (c. elegans) (FER1L4, Accession XM_300246.1) is another GAM136 target gene, herein designated TARGET GENE. FER1L4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FER1L4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:6674, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21549] Another function of GAM136 is therefore inhibition of Fer-1-like 4 (c. elegans) (FER1L4, Accession XM_300246.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4.

[21550] Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NM_005103.3) is another GAM136 target gene, herein designated TARGET GENE. FEZ1 BINDING SITE is a

target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FEZ1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:4839, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21551] Another function of GAM136 is therefore inhibition of Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NM_005103.3), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC- 76. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1.

[21552] The function of FEZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Fk506 binding protein 9, 63 kda (FKBP9, Accession NM_007270.1) is another GAM136 target gene, herein designated TARGET GENE. FKBP9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FKBP9, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP9 BINDING SITE, designated SEQ ID:19504, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21553] Another function of GAM136 is therefore inhibition of Fk506 binding protein 9, 63 kda (FKBP9, Accession NM_007270.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP9.

[21554] FLJ10956 (Accession NM_018283.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ10956 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10956, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10956 BINDING SITE, designated SEQ ID:10208, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21555] Another function of GAM136 is therefore inhibition of FLJ10956 (Accession NM_018283.1) . Accordingly, utilities

of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10956.

[21556] FLJ11467 (Accession NM_024963.2) is another GAM136 target gene, herein designated TARGET GENE. FLJ11467 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11467, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11467 BINDING SITE, designated SEQ ID:1757, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21557] Another function of GAM136 is therefore inhibition of FLJ11467 (Accession NM_024963.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11467.

[21558] FLJ11710 (Accession NM_024846.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ11710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11710, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:12430, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21559] Another function of GAM136 is therefore inhibition of FLJ11710 (Accession NM_024846.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710.

[21560] FLJ11800 (Accession NM_024974.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ11800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11800 BINDING SITE, designated SEQ ID:16539, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21561] Another function of GAM136 is therefore inhibition of FLJ11800 (Accession NM_024974.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11800.

[21562] FLJ12891 (Accession NM_024950.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ12891 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12891 BINDING SITE, designated SEQ ID:15272, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21563] Another function of GAM136 is therefore inhibition of FLJ12891 (Accession NM_024950.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12891.

[21564] FLJ12973 (Accession NM_024908.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ12973 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ12973 BINDING SITE, designated SEQ ID:7618, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21565] Another function of GAM136 is therefore inhibition of FLJ12973 (Accession NM_024908.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12973.

[21566] FLJ13193 (Accession) is another GAM136 target gene, herein designated TARGET GENE. FLJ13193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13193 BINDING SITE, designated SEQ ID:12298, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21567] Another function of GAM136 is therefore inhibition of FLJ13193 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13193.

[21568] FLJ13456 (Accession XM_038291.5) is another GAM136 target gene, herein designated TARGET GENE. FLJ13456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:19891, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21569] Another function of GAM136 is therefore inhibition of FLJ13456 (Accession XM_038291.5) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456.

[21570] FLJ14351 (Accession NM_024732.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ14351 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14351, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14351 BINDING SITE, designated SEQ ID:14477, to the

nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21571] Another function of GAM136 is therefore inhibition of FLJ14351 (Accession NM_024732.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14351.

[21572] FLJ14803 (Accession NM_032842.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ14803 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:5984, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21573] Another function of GAM136 is therefore inhibition of FLJ14803 (Accession NM_032842.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803.

[21574] FLJ14957 (Accession NM_032866.1) is another GAM136

target gene, herein designated TARGET GENE. FLJ14957 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14957, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:16340, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21575] Another function of GAM136 is therefore inhibition of FLJ14957 (Accession NM_032866.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957.

[21576] FLJ20004 (Accession) is another GAM136 target gene, herein designated TARGET GENE. FLJ20004 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20004, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE, designated SEQ ID:14892, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA,

also designated SEQ ID:279.

[21577] Another function of GAM136 is therefore inhibition of FLJ20004 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004.

[21578] FLJ20147 (Accession NM_017687.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ20147 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20147 BINDING SITE, designated SEQ ID:15668, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21579] Another function of GAM136 is therefore inhibition of FLJ20147 (Accession NM_017687.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20147.

[21580] FLJ20342 (Accession NM_017774.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ20342 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ20342, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20342 BINDING SITE, designated SEQ ID:12081, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21581] Another function of GAM136 is therefore inhibition of FLJ20342 (Accession NM_017774.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20342.

[21582] FLJ20700 (Accession NM_017932.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ20700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20700 BINDING SITE, designated SEQ ID:7187, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21583] Another function of GAM136 is therefore inhibition of

FLJ20700 (Accession NM_017932.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20700.

[21584] FLJ21603 (Accession) is another GAM136 target gene, herein designated TARGET GENE. FLJ21603 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21603, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21603 BINDING SITE, designated SEQ ID:17662, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21585] Another function of GAM136 is therefore inhibition of FLJ21603 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21603.

[21586] FLJ23024 (Accession NM_014150.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ23024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23024, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:8420, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21587] Another function of GAM136 is therefore inhibition of FLJ23024 (Accession NM_014150.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024.

[21588] FLJ23356 (Accession NM_032237.2) is another GAM136 target gene, herein designated TARGET GENE. FLJ23356 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23356, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23356 BINDING SITE, designated SEQ ID:17951, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21589] Another function of GAM136 is therefore inhibition of FLJ23356 (Accession NM_032237.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23356.

[21590] FLJ23392 (Accession NM_024784.2) is another GAM136 target gene, herein designated TARGET GENE. FLJ23392 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23392, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23392 BINDING SITE, designated SEQ ID:2537, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21591] Another function of GAM136 is therefore inhibition of FLJ23392 (Accession NM_024784.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23392.

[21592] FLJ23416 (Accession NM_032238.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ23416 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ23416 BINDING SITE, designated SEQ ID:5179, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21593] Another function of GAM136 is therefore inhibition of FLJ23416 (Accession NM_032238.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23416.

[21594] FLJ23556 (Accession NM_024880.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ23556 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23556, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:10048, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21595] Another function of GAM136 is therefore inhibition of FLJ23556 (Accession NM_024880.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ23556.

[21596] FLJ23563 (Accession XM_041701.5) is another GAM136 target gene, herein designated TARGET GENE. FLJ23563 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23563, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:3685, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21597] Another function of GAM136 is therefore inhibition of FLJ23563 (Accession XM_041701.5) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563.

[21598] FLJ32499 (Accession NM_144607.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ32499 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32499, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ32499 BINDING SITE, designated SEQ ID:8773, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21599] Another function of GAM136 is therefore inhibition of FLJ32499 (Accession NM_144607.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32499.

[21600] FLJ32865 (Accession NM_144613.1) is another GAM136 target gene, herein designated TARGET GENE. FLJ32865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:3736, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21601] Another function of GAM136 is therefore inhibition of FLJ32865 (Accession NM_144613.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865.

[21602] Growth hormone receptor (GHR, Accession NM_000163.1) is another GAM136 target gene, herein designated TARGET GENE. GHR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GHR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GHR BINDING SITE, designated SEQ ID:15462, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21603] Another function of GAM136 is therefore inhibition of Growth hormone receptor (GHR, Accession NM_000163.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHR.

[21604] Golgi autoantigen, golgin subfamily a, 3 (GOLGA3, Accession NM_005895.1) is another GAM136 target gene, herein designated TARGET GENE. GOLGA3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GOLGA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of GOLGA3 BINDING SITE, designated SEQ ID:10858, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21605] Another function of GAM136 is therefore inhibition of Golgi autoantigen, golgin subfamily a, 3 (GOLGA3, Accession NM_005895.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA3.

[21606] Glycoprotein v (platelet) (GP5, Accession NM_004488.1) is another GAM136 target gene, herein designated TARGET GENE. GP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:13821, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21607] Another function of GAM136 is therefore inhibition of Glycoprotein v (platelet) (GP5, Accession NM_004488.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5.

[21608] GR6 (Accession NM_007354.1) is another GAM136 target gene, herein designated TARGET GENE. GR6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:16362, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21609] Another function of GAM136 is therefore inhibition of GR6 (Accession NM_007354.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6.

[21610] Glutamate receptor, metabotropic 6 (GRM6, Accession NM_000843.2) is another GAM136 target gene, herein designated TARGET GENE. GRM6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRM6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, designated SEQ ID:19400, to the nucleotide sequence of GAM136

RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21611] Another function of GAM136 is therefore inhibition of Glutamate receptor, metabotropic 6 (GRM6, Accession NM_000843.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6.

[21612] GRWD (Accession NM_031485.1) is another GAM136 target gene, herein designated TARGET GENE. GRWD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRWD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRWD BINDING SITE, designated SEQ ID:19632, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21613] Another function of GAM136 is therefore inhibition of GRWD (Accession NM_031485.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRWD.

[21614] GTPBG3 (Accession NM_032620.1) is another GAM136 target gene, herein designated TARGET GENE. GTPBG3

BINDING SITE1 and GTPBG3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GTPBG3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTPBG3 BINDING SITE1 and GTPBG3 BINDING SITE2, designated SEQ ID:14680 and SEQ ID:18851 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21615] Another function of GAM136 is therefore inhibition of GTPBG3 (Accession NM_032620.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBG3.

[21616] HCA4 (Accession) is another GAM136 target gene, herein designated TARGET GENE. HCA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HCA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:5223, to the nucleotide sequence of GAM136 RNA,

herein designated GAM RNA, also designated SEQ ID:279.

[21617] Another function of GAM136 is therefore inhibition of HCA4 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4.

[21618] Histamine receptor h4 (HRH4, Accession NM_021624.2) is another GAM136 target gene, herein designated TARGET GENE. HRH4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:8519, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21619] Another function of GAM136 is therefore inhibition of Histamine receptor h4 (HRH4, Accession NM_021624.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4.

[21620] HSPC065 (Accession NM_014157.2) is another GAM136 target gene, herein designated TARGET GENE. HSPC065 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by HSPC065, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:19775, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21621] Another function of GAM136 is therefore inhibition of HSPC065 (Accession NM_014157.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065.

[21622] Hormonally upregulated neu-associated kinase (HUNK, Accession NM_014586.1) is another GAM136 target gene, herein designated TARGET GENE. HUNK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HUNK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:11495, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21623] Another function of GAM136 is therefore inhibition of Hormonally upregulated neu-associated kinase (HUNK, Accession NM_014586.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK.

[21624] Immunoglobulin superfamily, member 2 (IGSF2, Accession NM_004258.1) is another GAM136 target gene, herein designated TARGET GENE. IGSF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGSF2 BINDING SITE, designated SEQ ID:8672, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21625] Another function of GAM136 is therefore inhibition of Immunoglobulin superfamily, member 2 (IGSF2, Accession NM_004258.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGSF2.

[21626] IMPACT (Accession NM_018439.1) is another GAM136 target gene, herein designated TARGET GENE. IMPACT BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by IMPACT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:19776, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21627] Another function of GAM136 is therefore inhibition of IMPACT (Accession NM_018439.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPACT.

[21628] Indolethylamine n-methyltransferase (INMT, Accession NM_006774.3) is another GAM136 target gene, herein designated TARGET GENE. INMT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INMT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INMT BINDING SITE, designated SEQ ID:3823, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21629] Another function of GAM136 is therefore inhibition of Indolethylamine n-methyltransferase (INMT, Accession

NM_006774.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INMT.

[21630] Junctional adhesion molecule 1 (JAM1, Accession) is another GAM136 target gene, herein designated TARGET GENE. JAM1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by JAM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE, designated SEQ ID:14909, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21631] Another function of GAM136 is therefore inhibition of Junctional adhesion molecule 1 (JAM1, Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1.

[21632] JM11 (Accession NM_033626.1) is another GAM136 target gene, herein designated TARGET GENE. JM11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JM11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:3482, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21633] Another function of GAM136 is therefore inhibition of JM11 (Accession NM_033626.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11.

[21634] KIAA0063 (Accession NM_014876.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA0063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:3287, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21635] Another function of GAM136 is therefore inhibition of KIAA0063 (Accession NM_014876.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0063.

[21636] KIAA0087 (Accession NM_014769.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA0087 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:17094, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21637] Another function of GAM136 is therefore inhibition of KIAA0087 (Accession NM_014769.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087.

[21638] KIAA0090 (Accession NM_015047.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA0090 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0090, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0090 BINDING SITE, designated SEQ ID:1552, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21639] Another function of GAM136 is therefore inhibition of KIAA0090 (Accession NM_015047.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090.

[21640] KIAA0161 (Accession) is another GAM136 target gene, herein designated TARGET GENE. KIAA0161 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0161 BINDING SITE, designated SEQ ID:15212, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21641] Another function of GAM136 is therefore inhibition of KIAA0161 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0161.

[21642] KIAA0205 (Accession NM_014873.1) is another GAM136

target gene, herein designated TARGET GENE. KIAA0205 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0205, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:11019, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21643] Another function of GAM136 is therefore inhibition of KIAA0205 (Accession NM_014873.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205.

[21644] KIAA0210 (Accession) is another GAM136 target gene, herein designated TARGET GENE. KIAA0210 BINDING SITE1 and KIAA0210 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0210, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE1 and KIAA0210 BINDING SITE2, designated SEQ ID:12431 and

SEQ ID:10972 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21645] Another function of GAM136 is therefore inhibition of KIAA0210 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210.

[21646] KIAA0406 (Accession NM_014657.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA0406 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0406, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0406 BINDING SITE, designated SEQ ID:13524, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21647] Another function of GAM136 is therefore inhibition of KIAA0406 (Accession NM_014657.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0406.

[21648] KIAA0441 (Accession NM_014797.1) is another GAM136

target gene, herein designated TARGET GENE. KIAA0441 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0441, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:1227, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21649] Another function of GAM136 is therefore inhibition of KIAA0441 (Accession NM_014797.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441.

[21650] KIAA0447 (Accession) is another GAM136 target gene, herein designated TARGET GENE. KIAA0447 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0447, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:9929, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA,

also designated SEQ ID:279.

[21651] Another function of GAM136 is therefore inhibition of KIAA0447 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447.

[21652] KIAA0459 (Accession XM_027862.7) is another GAM136 target gene, herein designated TARGET GENE. KIAA0459 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:16587, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21653] Another function of GAM136 is therefore inhibition of KIAA0459 (Accession XM_027862.7) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459.

[21654] KIAA0493 (Accession XM_034717.8) is another GAM136 target gene, herein designated TARGET GENE. KIAA0493 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by KIAA0493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:16273, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21655] Another function of GAM136 is therefore inhibition of KIAA0493 (Accession XM_034717.8) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493.

[21656] KIAA0561 (Accession XM_038150.2) is another GAM136 target gene, herein designated TARGET GENE. KIAA0561 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0561, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:10973, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21657] Another function of GAM136 is therefore inhibition of

KIAA0561 (Accession XM_038150.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561.

[21658] KIAA0594 (Accession) is another GAM136 target gene, herein designated TARGET GENE. KIAA0594 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0594, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:9870, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21659] Another function of GAM136 is therefore inhibition of KIAA0594 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594.

[21660] KIAA0599 (Accession XM_085127.6) is another GAM136 target gene, herein designated TARGET GENE. KIAA0599 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0599, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:18369, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21661] Another function of GAM136 is therefore inhibition of KIAA0599 (Accession XM_085127.6) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599.

[21662] KIAA0711 (Accession NM_014867.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA0711 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0711, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:4700, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21663] Another function of GAM136 is therefore inhibition of KIAA0711 (Accession NM_014867.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0711.

[21664] KIAA0841 (Accession XM_049237.5) is another GAM136 target gene, herein designated TARGET GENE. KIAA0841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:4724, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21665] Another function of GAM136 is therefore inhibition of KIAA0841 (Accession XM_049237.5) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841.

[21666] KIAA0924 (Accession NM_014897.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA0924 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:3141, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21667] Another function of GAM136 is therefore inhibition of KIAA0924 (Accession NM_014897.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924.

[21668] KIAA0931 (Accession XM_041191.4) is another GAM136 target gene, herein designated TARGET GENE. KIAA0931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:19082, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21669] Another function of GAM136 is therefore inhibition of KIAA0931 (Accession XM_041191.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0931.

[21670] KIAA0961 (Accession NM_014898.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA0961 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0961, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0961 BINDING SITE, designated SEQ ID:19593, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21671] Another function of GAM136 is therefore inhibition of KIAA0961 (Accession NM_014898.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0961.

[21672] KIAA1028 (Accession) is another GAM136 target gene, herein designated TARGET GENE. KIAA1028 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1028, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1028

BINDING SITE, designated SEQ ID:18235, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21673] Another function of GAM136 is therefore inhibition of KIAA1028 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028.

[21674] KIAA1143 (Accession XM_044014.3) is another GAM136 target gene, herein designated TARGET GENE. KIAA1143 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1143, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:12426, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21675] Another function of GAM136 is therefore inhibition of KIAA1143 (Accession XM_044014.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143.

[21676] KIAA1161 (Accession) is another GAM136 target gene,

herein designated TARGET GENE. KIAA1161 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:11081, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21677] Another function of GAM136 is therefore inhibition of KIAA1161 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161.

[21678] KIAA1185 (Accession NM_020710.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA1185 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1185 BINDING SITE, designated SEQ ID:2134, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21679] Another function of GAM136 is therefore inhibition of KIAA1185 (Accession NM_020710.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1185.

[21680] KIAA1193 (Accession XM_041843.2) is another GAM136 target gene, herein designated TARGET GENE. KIAA1193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:18852, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21681] Another function of GAM136 is therefore inhibition of KIAA1193 (Accession XM_041843.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193.

[21682] KIAA1210 (Accession XM_172801.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA1210 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by KIAA1210, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE, designated SEQ ID:4237, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21683] Another function of GAM136 is therefore inhibition of KIAA1210 (Accession XM_172801.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210.

[21684] KIAA1254 (Accession) is another GAM136 target gene, herein designated TARGET GENE. KIAA1254 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1254, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1254 BINDING SITE, designated SEQ ID:2406, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21685] Another function of GAM136 is therefore inhibition of

KIAA1254 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1254.

[21686] KIAA1257 (Accession XM_031577.3) is another GAM136 target gene, herein designated TARGET GENE. KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1257, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2, designated SEQ ID:15885 and SEQ ID:5979 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21687] Another function of GAM136 is therefore inhibition of KIAA1257 (Accession XM_031577.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257.

[21688] KIAA1280 (Accession NM_015691.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA1280 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by KIAA1280, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:8845, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21689] Another function of GAM136 is therefore inhibition of KIAA1280 (Accession NM_015691.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280.

[21690] KIAA1530 (Accession XM_042661.5) is another GAM136 target gene, herein designated TARGET GENE. KIAA1530 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1530, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:13682, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21691] Another function of GAM136 is therefore inhibition of

KIAA1530 (Accession XM_042661.5) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530.

[21692] KIAA1649 (Accession) is another GAM136 target gene, herein designated TARGET GENE. KIAA1649 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1649, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:16107, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21693] Another function of GAM136 is therefore inhibition of KIAA1649 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649.

[21694] KIAA1712 (Accession XM_041497.9) is another GAM136 target gene, herein designated TARGET GENE. KIAA1712 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA1712, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:5693, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21695] Another function of GAM136 is therefore inhibition of KIAA1712 (Accession XM_041497.9) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712.

[21696] KIAA1727 (Accession XM_034262.6) is another GAM136 target gene, herein designated TARGET GENE. KIAA1727 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:5388, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21697] Another function of GAM136 is therefore inhibition of KIAA1727 (Accession XM_034262.6) . Accordingly, utilities of GAM136 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1727.

[21698] KIAA1737 (Accession NM_033426.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA1737 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:3552, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21699] Another function of GAM136 is therefore inhibition of KIAA1737 (Accession NM_033426.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737.

[21700] KIAA1829 (Accession XM_030378.2) is another GAM136 target gene, herein designated TARGET GENE. KIAA1829 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1829, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:13422, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21701] Another function of GAM136 is therefore inhibition of KIAA1829 (Accession XM_030378.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829.

[21702] KIAA1922 (Accession XM_057040.1) is another GAM136 target gene, herein designated TARGET GENE. KIAA1922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:13683, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21703] Another function of GAM136 is therefore inhibition of KIAA1922 (Accession XM_057040.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1922.

[21704] KIAA1924 (Accession NM_153239.2) is another GAM136 target gene, herein designated TARGET GENE. KIAA1924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:5980, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21705] Another function of GAM136 is therefore inhibition of KIAA1924 (Accession NM_153239.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924.

[21706] KIAA1956 (Accession XM_085836.6) is another GAM136 target gene, herein designated TARGET GENE. KIAA1956 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1956, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1956 BINDING SITE, designated SEQ ID:17777, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21707] Another function of GAM136 is therefore inhibition of KIAA1956 (Accession XM_085836.6) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1956.

[21708] KIAA1971 (Accession XM_058720.5) is another GAM136 target gene, herein designated TARGET GENE. KIAA1971 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:11033, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21709] Another function of GAM136 is therefore inhibition of KIAA1971 (Accession XM_058720.5) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971.

[21710] Lysosomal-associated membrane protein 3 (LAMP3, Accession NM_014398.1) is another GAM136 target gene, herein designated TARGET GENE. LAMP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAMP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAMP3 BINDING SITE, designated SEQ ID:13626, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21711] Another function of GAM136 is therefore inhibition of Lysosomal-associated membrane protein 3 (LAMP3, Accession NM_014398.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP3.

[21712] Leukocyte immunoglobulin-like receptor, subfamily a (without tm domain), member 3 (LILRA3, Accession NM_006865.1) is another GAM136 target gene, herein designated TARGET GENE. LILRA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LILRA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LILRA3 BINDING SITE, designated SEQ ID:16588, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21713] Another function of GAM136 is therefore inhibition of Leukocyte immunoglobulin-like receptor, subfamily a (without tm domain), member 3 (LILRA3, Accession NM_006865.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRA3.

[21714] Lethal giant larvae homolog 1 (drosophila) (LLGL1, Accession NM_004140.2) is another GAM136 target gene, herein designated TARGET GENE. LLGL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LLGL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LLGL1 BINDING SITE, designated SEQ ID:17511, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21715] Another function of GAM136 is therefore inhibition of

Lethal giant larvae homolog 1 (drosophila) (LLGL1, Accession NM_004140.2), a gene which has a role in control of cell proliferation and differentiation during development. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LLGL1.

[21716] The function of LLGL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM116.1.LOC112724 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC112724 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC112724, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC112724 BINDING SITE, designated SEQ ID:4017, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21717] Another function of GAM136 is therefore inhibition of LOC112724 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC112724.

[21718] LOC113675 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC113675 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC113675, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC113675 BINDING SITE, designated SEQ ID:5894, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21719] Another function of GAM136 is therefore inhibition of LOC113675 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113675.

[21720] LOC115219 (Accession XM_055499.4) is another GAM136 target gene, herein designated TARGET GENE. LOC115219 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC115219, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC115219 BINDING SITE, designated SEQ ID:1562, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21721] Another function of GAM136 is therefore inhibition of LOC115219 (Accession XM_055499.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115219.

[21722] LOC119392 (Accession NM_145247.1) is another GAM136 target gene, herein designated TARGET GENE. LOC119392 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC119392, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC119392 BINDING SITE, designated SEQ ID:3818, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21723] Another function of GAM136 is therefore inhibition of LOC119392 (Accession NM_145247.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119392.

[21724] LOC120939 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC120939 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC120939, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:13240, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21725] Another function of GAM136 is therefore inhibition of LOC120939 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939.

[21726] LOC126133 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC126133 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126133 BINDING SITE, designated SEQ ID:17494, to

the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21727] Another function of GAM136 is therefore inhibition of LOC126133 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126133.

[21728] LOC126669 (Accession XM_060121.4) is another GAM136 target gene, herein designated TARGET GENE. LOC126669 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC126669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:9831, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21729] Another function of GAM136 is therefore inhibition of LOC126669 (Accession XM_060121.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669.

[21730] LOC128387 (Accession XM_059243.3) is another GAM136

target gene, herein designated TARGET GENE. LOC128387 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC128387, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC128387 BINDING SITE, designated SEQ ID:5976, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21731] Another function of GAM136 is therefore inhibition of LOC128387 (Accession XM_059243.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128387.

[21732] LOC131308 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC131308 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131308, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131308 BINDING SITE, designated SEQ ID:9826, to the nucleotide sequence of GAM136 RNA, herein designated

GAM RNA, also designated SEQ ID:279.

[21733] Another function of GAM136 is therefore inhibition of LOC131308 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131308.

[21734] LOC135154 (Accession NM_145267.1) is another GAM136 target gene, herein designated TARGET GENE. LOC135154 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135154, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135154 BINDING SITE, designated SEQ ID:5005, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21735] Another function of GAM136 is therefore inhibition of LOC135154 (Accession NM_145267.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135154.

[21736] LOC135398 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC135398 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135398, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135398 BINDING SITE, designated SEQ ID:11002, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21737] Another function of GAM136 is therefore inhibition of LOC135398 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135398.

[21738] LOC135763 (Accession NM_138572.1) is another GAM136 target gene, herein designated TARGET GENE. LOC135763 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135763, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:3127, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21739] Another function of GAM136 is therefore inhibition of LOC135763 (Accession NM_138572.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135763.

[21740] LOC138050 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC138050 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC138050, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC138050 BINDING SITE, designated SEQ ID:5749, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21741] Another function of GAM136 is therefore inhibition of LOC138050 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138050.

[21742] LOC138199 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC138199 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC138199, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC138199 BINDING SITE, designated SEQ ID:5770, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21743] Another function of GAM136 is therefore inhibition of LOC138199 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138199.

[21744] LOC142927 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC142927 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC142927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC142927 BINDING SITE, designated SEQ ID:9930, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21745] Another function of GAM136 is therefore inhibition of

LOC142927 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142927.

[21746] LOC144317 (Accession XM_084813.4) is another GAM136 target gene, herein designated TARGET GENE. LOC144317 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144317, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144317 BINDING SITE, designated SEQ ID:14198, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21747] Another function of GAM136 is therefore inhibition of LOC144317 (Accession XM_084813.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144317.

[21748] LOC145268 (Accession XM_085072.1) is another GAM136 target gene, herein designated TARGET GENE. LOC145268 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145268, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145268 BINDING SITE, designated SEQ ID:6134, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21749] Another function of GAM136 is therefore inhibition of LOC145268 (Accession XM_085072.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145268.

[21750] LOC145622 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC145622 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:14806, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21751] Another function of GAM136 is therefore inhibition of LOC145622 (Accession) . Accordingly, utilities of

GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622.

[21752] LOC145813 (Accession XM_096873.2) is another GAM136 target gene, herein designated TARGET GENE. LOC145813 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145813 BINDING SITE, designated SEQ ID:9548, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21753] Another function of GAM136 is therefore inhibition of LOC145813 (Accession XM_096873.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145813.

[21754] LOC146229 (Accession XM_085387.1) is another GAM136 target gene, herein designated TARGET GENE. LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC146229, corresponding to target binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2, designated SEQ ID:12076 and SEQ ID:3787 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21755] Another function of GAM136 is therefore inhibition of LOC146229 (Accession XM_085387.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229.

[21756] LOC146443 (Accession XM_085461.6) is another GAM136 target gene, herein designated TARGET GENE. LOC146443 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146443 BINDING SITE, designated SEQ ID:14100, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21757] Another function of GAM136 is therefore inhibition of

LOC146443 (Accession XM_085461.6) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146443.

[21758] LOC146455 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC146455 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146455, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:12428, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21759] Another function of GAM136 is therefore inhibition of LOC146455 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455.

[21760] LOC146901 (Accession XM_097121.1) is another GAM136 target gene, herein designated TARGET GENE. LOC146901 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146901, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146901 BINDING SITE, designated SEQ ID:14423, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21761] Another function of GAM136 is therefore inhibition of LOC146901 (Accession XM_097121.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146901.

[21762] LOC146909 (Accession XM_085634.3) is another GAM136 target gene, herein designated TARGET GENE. LOC146909 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:12423, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21763] Another function of GAM136 is therefore inhibition of LOC146909 (Accession XM_085634.3) . Accordingly, utili-

ties of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909.

[21764] LOC147276 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC147276 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147276 BINDING SITE, designated SEQ ID:4474, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21765] Another function of GAM136 is therefore inhibition of LOC147276 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147276.

[21766] LOC147429 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC147429 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147429, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147429 BINDING SITE, designated SEQ ID:15647, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21767] Another function of GAM136 is therefore inhibition of LOC147429 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147429.

[21768] LOC147660 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC147660 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147660, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147660 BINDING SITE, designated SEQ ID:10507, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21769] Another function of GAM136 is therefore inhibition of LOC147660 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LOC147660.

[21770] LOC147990 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC147990 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147990, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147990 BINDING SITE, designated SEQ ID:4469, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21771] Another function of GAM136 is therefore inhibition of LOC147990 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147990.

[21772] LOC148137 (Accession NM_144692.1) is another GAM136 target gene, herein designated TARGET GENE. LOC148137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:17632, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21773] Another function of GAM136 is therefore inhibition of LOC148137 (Accession NM_144692.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137.

[21774] LOC148189 (Accession XM_086087.1) is another GAM136 target gene, herein designated TARGET GENE. LOC148189 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148189, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:7424, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21775] Another function of GAM136 is therefore inhibition of LOC148189 (Accession XM_086087.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148189.

[21776] LOC148195 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC148195 BINDING SITE1 and LOC148195 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC148195, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE1 and LOC148195 BINDING SITE2, designated SEQ ID:15515 and SEQ ID:1164 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21777] Another function of GAM136 is therefore inhibition of LOC148195 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195.

[21778] LOC148645 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC148645 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148645, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148645 BINDING SITE, designated SEQ ID:11573, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21779] Another function of GAM136 is therefore inhibition of LOC148645 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148645.

[21780] LOC148887 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC148887 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148887, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148887 BINDING SITE, designated SEQ ID:13862, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21781] Another function of GAM136 is therefore inhibition of LOC148887 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LOC148887.

[21782] LOC149117 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC149117 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149117 BINDING SITE, designated SEQ ID:17663, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21783] Another function of GAM136 is therefore inhibition of LOC149117 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149117.

[21784] LOC149506 (Accession XM_097661.4) is another GAM136 target gene, herein designated TARGET GENE. LOC149506 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:6703, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21785] Another function of GAM136 is therefore inhibition of LOC149506 (Accession XM_097661.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506.

[21786] LOC149692 (Accession XM_097706.1) is another GAM136 target gene, herein designated TARGET GENE. LOC149692 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149692, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149692 BINDING SITE, designated SEQ ID:14807, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21787] Another function of GAM136 is therefore inhibition of LOC149692 (Accession XM_097706.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149692.

[21788] LOC150225 (Accession XM_097870.1) is another GAM136 target gene, herein designated TARGET GENE. LOC150225 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150225, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:9366, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21789] Another function of GAM136 is therefore inhibition of LOC150225 (Accession XM_097870.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225.

[21790] LOC150397 (Accession XM_086907.1) is another GAM136 target gene, herein designated TARGET GENE. LOC150397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC150397 BINDING SITE, designated SEQ ID:9404, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21791] Another function of GAM136 is therefore inhibition of LOC150397 (Accession XM_086907.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397.

[21792] LOC151057 (Accession XM_097998.2) is another GAM136 target gene, herein designated TARGET GENE. LOC151057 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151057 BINDING SITE, designated SEQ ID:9827, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21793] Another function of GAM136 is therefore inhibition of LOC151057 (Accession XM_097998.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151057.

[21794] LOC151201 (Accession XM_098021.1) is another GAM136 target gene, herein designated TARGET GENE. LOC151201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:3995, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21795] Another function of GAM136 is therefore inhibition of LOC151201 (Accession XM_098021.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201.

[21796] LOC151475 (Accession XM_098063.1) is another GAM136 target gene, herein designated TARGET GENE. LOC151475 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151475, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:19282, to

the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21797] Another function of GAM136 is therefore inhibition of LOC151475 (Accession XM_098063.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475.

[21798] LOC151602 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC151602 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151602, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151602 BINDING SITE, designated SEQ ID:16085, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21799] Another function of GAM136 is therefore inhibition of LOC151602 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151602.

[21800] LOC151826 (Accession) is another GAM136 target gene,

herein designated TARGET GENE. LOC151826 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151826, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151826 BINDING SITE, designated SEQ ID:9541, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21801] Another function of GAM136 is therefore inhibition of LOC151826 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151826.

[21802] LOC152137 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC152137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152137 BINDING SITE, designated SEQ ID:8819, to the nucleotide sequence of GAM136 RNA, herein designated

GAM RNA, also designated SEQ ID:279.

[21803] Another function of GAM136 is therefore inhibition of LOC152137 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152137.

[21804] LOC152220 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC152220 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:6805, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21805] Another function of GAM136 is therefore inhibition of LOC152220 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220.

[21806] LOC152300 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC152300 BINDING

SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152300, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:412, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21807] Another function of GAM136 is therefore inhibition of LOC152300 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300.

[21808] LOC152582 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC152582 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152582, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152582 BINDING SITE, designated SEQ ID:10692, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21809] Another function of GAM136 is therefore inhibition of LOC152582 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152582.

[21810] LOC152719 (Accession XM_098257.1) is another GAM136 target gene, herein designated TARGET GENE. LOC152719 BINDING SITE1 and LOC152719 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC152719, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152719 BINDING SITE1 and LOC152719 BINDING SITE2, designated SEQ ID:5750 and SEQ ID:3422 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21811] Another function of GAM136 is therefore inhibition of LOC152719 (Accession XM_098257.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152719.

[21812] LOC152794 (Accession XM_087525.1) is another GAM136

target gene, herein designated TARGET GENE. LOC152794 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152794, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152794 BINDING SITE, designated SEQ ID:8624, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21813] Another function of GAM136 is therefore inhibition of LOC152794 (Accession XM_087525.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152794.

[21814] LOC153606 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC153606 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153606, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153606 BINDING SITE, designated SEQ ID:6383, to the nucleotide sequence of GAM136 RNA, herein designated

GAM RNA, also designated SEQ ID:279.

[21815] Another function of GAM136 is therefore inhibition of LOC153606 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153606.

[21816] LOC153688 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC153688 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153688, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:11003, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21817] Another function of GAM136 is therefore inhibition of LOC153688 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688.

[21818] LOC153811 (Accession XM_087779.2) is another GAM136 target gene, herein designated TARGET GENE. LOC153811

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153811, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:12732, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21819] Another function of GAM136 is therefore inhibition of LOC153811 (Accession XM_087779.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153811.

[21820] LOC153883 (Accession XM_087798.1) is another GAM136 target gene, herein designated TARGET GENE. LOC153883 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153883, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153883 BINDING SITE, designated SEQ ID:14252, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21821] Another function of GAM136 is therefore inhibition of LOC153883 (Accession XM_087798.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153883.

[21822] LOC154877 (Accession XM_098626.4) is another GAM136 target gene, herein designated TARGET GENE. LOC154877 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:9289, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21823] Another function of GAM136 is therefore inhibition of LOC154877 (Accession XM_098626.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877.

[21824] LOC157506 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC157506 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC157506, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157506 BINDING SITE, designated SEQ ID:17205, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21825] Another function of GAM136 is therefore inhibition of LOC157506 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157506.

[21826] LOC157507 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC157507 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:15895, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21827] Another function of GAM136 is therefore inhibition of

LOC157507 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157507.

[21828] LOC157798 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC157798 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157798 BINDING SITE, designated SEQ ID:1563, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21829] Another function of GAM136 is therefore inhibition of LOC157798 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798.

[21830] LOC157858 (Accession XM_098833.3) is another GAM136 target gene, herein designated TARGET GENE. LOC157858 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157858, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:11827, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21831] Another function of GAM136 is therefore inhibition of LOC157858 (Accession XM_098833.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858.

[21832] LOC158402 (Accession XM_098936.1) is another GAM136 target gene, herein designated TARGET GENE. LOC158402 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158402, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:413, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21833] Another function of GAM136 is therefore inhibition of LOC158402 (Accession XM_098936.1) . Accordingly, utili-

ties of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402.

[21834] LOC158476 (Accession XM_098955.1) is another GAM136 target gene, herein designated TARGET GENE. LOC158476 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158476, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:12077, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21835] Another function of GAM136 is therefore inhibition of LOC158476 (Accession XM_098955.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476.

[21836] LOC158668 (Accession XM_045161.1) is another GAM136 target gene, herein designated TARGET GENE. LOC158668 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158668, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158668 BINDING SITE, designated SEQ ID:8440, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21837] Another function of GAM136 is therefore inhibition of LOC158668 (Accession XM_045161.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158668.

[21838] LOC162022 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC162022 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC162022, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162022 BINDING SITE, designated SEQ ID:16604, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21839] Another function of GAM136 is therefore inhibition of LOC162022 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LOC162022.

[21840] LOC169611 (Accession XM_095809.4) is another GAM136 target gene, herein designated TARGET GENE. LOC169611 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC169611, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:11646, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21841] Another function of GAM136 is therefore inhibition of LOC169611 (Accession XM_095809.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169611.

[21842] LOC196529 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC196529 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC196529 BINDING SITE, designated SEQ ID:5060, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21843] Another function of GAM136 is therefore inhibition of LOC196529 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196529.

[21844] LOC197358 (Accession XM_113872.2) is another GAM136 target gene, herein designated TARGET GENE. LOC197358 BINDING SITE1 and LOC197358 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC197358, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE1 and LOC197358 BINDING SITE2, designated SEQ ID:16351 and SEQ ID:17773 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21845] Another function of GAM136 is therefore inhibition of LOC197358 (Accession XM_113872.2) . Accordingly, utili-

ties of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358.

[21846] LOC200014 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC200014 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200014, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:3544, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21847] Another function of GAM136 is therefore inhibition of LOC200014 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014.

[21848] LOC200169 (Accession XM_117200.2) is another GAM136 target gene, herein designated TARGET GENE. LOC200169 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC200169, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200169 BINDING SITE, designated SEQ ID:6860, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21849] Another function of GAM136 is therefore inhibition of LOC200169 (Accession XM_117200.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200169.

[21850] LOC200316 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC200316 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200316 BINDING SITE, designated SEQ ID:6549, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21851] Another function of GAM136 is therefore inhibition of LOC200316 (Accession) . Accordingly, utilities of

GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200316.

[21852] LOC201164 (Accession XM_290750.1) is another GAM136 target gene, herein designated TARGET GENE. LOC201164 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC201164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:17606, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21853] Another function of GAM136 is therefore inhibition of LOC201164 (Accession XM_290750.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164.

[21854] LOC201702 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC201702 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC201702, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201702 BINDING SITE, designated SEQ ID:7983, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21855] Another function of GAM136 is therefore inhibition of LOC201702 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201702.

[21856] LOC202459 (Accession NM_145303.1) is another GAM136 target gene, herein designated TARGET GENE. LOC202459 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC202459, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC202459 BINDING SITE, designated SEQ ID:5848, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21857] Another function of GAM136 is therefore inhibition of LOC202459 (Accession NM_145303.1) . Accordingly, utili-

ties of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202459.

[21858] LOC203197 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC203197 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC203197, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:18848, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21859] Another function of GAM136 is therefore inhibition of LOC203197 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203197.

[21860] LOC203427 (Accession NM_145305.1) is another GAM136 target gene, herein designated TARGET GENE. LOC203427 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC203427, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203427 BINDING SITE, designated SEQ ID:20008, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21861] Another function of GAM136 is therefore inhibition of LOC203427 (Accession NM_145305.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203427.

[21862] LOC204804 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC204804 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC204804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC204804 BINDING SITE, designated SEQ ID:3925, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21863] Another function of GAM136 is therefore inhibition of LOC204804 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LOC204804.

[21864] LOC219673 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC219673 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219673 BINDING SITE, designated SEQ ID:17829, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21865] Another function of GAM136 is therefore inhibition of LOC219673 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219673.

[21866] LOC219735 (Accession XM_167601.1) is another GAM136 target gene, herein designated TARGET GENE. LOC219735 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219735, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC219735 BINDING SITE, designated SEQ ID:4328, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21867] Another function of GAM136 is therefore inhibition of LOC219735 (Accession XM_167601.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219735.

[21868] LOC219894 (Accession XM_167782.3) is another GAM136 target gene, herein designated TARGET GENE. LOC219894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:16436, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21869] Another function of GAM136 is therefore inhibition of LOC219894 (Accession XM_167782.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219894.

[21870] LOC220575 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC220575 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220575, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220575 BINDING SITE, designated SEQ ID:12503, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21871] Another function of GAM136 is therefore inhibition of LOC220575 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220575.

[21872] LOC220662 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC220662 BINDING SITE1 and LOC220662 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC220662, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of LOC220662 BINDING SITE1 and LOC220662 BINDING SITE2, designated SEQ ID:16580 and SEQ ID:17095 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21873] Another function of GAM136 is therefore inhibition of LOC220662 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220662.

[21874] LOC221174 (Accession XM_167915.1) is another GAM136 target gene, herein designated TARGET GENE. LOC221174 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221174 BINDING SITE, designated SEQ ID:15254, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21875] Another function of GAM136 is therefore inhibition of LOC221174 (Accession XM_167915.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221174.

[21876] LOC221271 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC221271 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221271, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:2971, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21877] Another function of GAM136 is therefore inhibition of LOC221271 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271.

[21878] LOC221663 (Accession XM_168131.1) is another GAM136 target gene, herein designated TARGET GENE. LOC221663 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC221663 BINDING SITE, designated SEQ ID:14871, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21879] Another function of GAM136 is therefore inhibition of LOC221663 (Accession XM_168131.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221663.

[21880] LOC245771 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC245771 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC245771, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:14523, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21881] Another function of GAM136 is therefore inhibition of LOC245771 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC245771.

[21882] LOC254013 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC254013 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254013, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254013 BINDING SITE, designated SEQ ID:18200, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21883] Another function of GAM136 is therefore inhibition of LOC254013 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254013.

[21884] LOC254268 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC254268 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC254268 BINDING SITE, designated SEQ ID:7619, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21885] Another function of GAM136 is therefore inhibition of LOC254268 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254268.

[21886] LOC255196 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC255196 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255196, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:1324, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21887] Another function of GAM136 is therefore inhibition of LOC255196 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196.

[21888] LOC255465 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC255465 BINDING SITE1 and LOC255465 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC255465, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE1 and LOC255465 BINDING SITE2, designated SEQ ID:9221 and SEQ ID:17676 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21889] Another function of GAM136 is therefore inhibition of LOC255465 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465.

[21890] LOC255919 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC255919 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255919, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC255919 BINDING SITE, designated SEQ ID:2135, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21891] Another function of GAM136 is therefore inhibition of LOC255919 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255919.

[21892] LOC256923 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC256923 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256923, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256923 BINDING SITE, designated SEQ ID:7013, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21893] Another function of GAM136 is therefore inhibition of LOC256923 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256923.

[21894] LOC257054 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC257054 BINDING SITE1 and LOC257054 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC257054, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257054 BINDING SITE1 and LOC257054 BINDING SITE2, designated SEQ ID:14524 and SEQ ID:18129 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21895] Another function of GAM136 is therefore inhibition of LOC257054 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257054.

[21896] LOC90485 (Accession XM_032059.1) is another GAM136 target gene, herein designated TARGET GENE. LOC90485 BINDING SITE1 and LOC90485 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC90485, corresponding to target binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90485 BINDING SITE1 and LOC90485 BINDING SITE2, designated SEQ ID:20154 and SEQ ID:15288 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21897] Another function of GAM136 is therefore inhibition of LOC90485 (Accession XM_032059.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90485.

[21898] LOC90591 (Accession XM_032811.1) is another GAM136 target gene, herein designated TARGET GENE. LOC90591 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90591, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:13863, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21899] Another function of GAM136 is therefore inhibition of

LOC90591 (Accession XM_032811.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591.

[21900] LOC91115 (Accession XM_036218.4) is another GAM136 target gene, herein designated TARGET GENE. LOC91115 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:4470, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21901] Another function of GAM136 is therefore inhibition of LOC91115 (Accession XM_036218.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115.

[21902] LOC91373 (Accession XM_038063.8) is another GAM136 target gene, herein designated TARGET GENE. LOC91373 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91373, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91373 BINDING SITE, designated SEQ ID:18364, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21903] Another function of GAM136 is therefore inhibition of LOC91373 (Accession XM_038063.8) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91373.

[21904] LOC91547 (Accession XM_039093.5) is another GAM136 target gene, herein designated TARGET GENE. LOC91547 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91547, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91547 BINDING SITE, designated SEQ ID:19265, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21905] Another function of GAM136 is therefore inhibition of LOC91547 (Accession XM_039093.5) . Accordingly, utili-

ties of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91547.

[21906] LOC91561 (Accession XM_039218.8) is another GAM136 target gene, herein designated TARGET GENE. LOC91561 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91561, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91561 BINDING SITE, designated SEQ ID:1319, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21907] Another function of GAM136 is therefore inhibition of LOC91561 (Accession XM_039218.8) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91561.

[21908] LOC92148 (Accession XM_043160.9) is another GAM136 target gene, herein designated TARGET GENE. LOC92148 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92148, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92148 BINDING SITE, designated SEQ ID:15402, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21909] Another function of GAM136 is therefore inhibition of LOC92148 (Accession XM_043160.9) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92148.

[21910] LOC92466 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC92466 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92466 BINDING SITE, designated SEQ ID:10843, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21911] Another function of GAM136 is therefore inhibition of LOC92466 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC92466.

[21912] LOC92697 (Accession) is another GAM136 target gene, herein designated TARGET GENE. LOC92697 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92697, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE, designated SEQ ID:3545, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21913] Another function of GAM136 is therefore inhibition of LOC92697 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92697.

[21914] Leukotriene b4 receptor (LTB4R, Accession NM_000752.1) is another GAM136 target gene, herein designated TARGET GENE. LTB4R BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LTB4R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTB4R BINDING SITE, designated

SEQ ID:2471, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21915] Another function of GAM136 is therefore inhibition of Leukotriene b4 receptor (LTB4R, Accession NM_000752.1), a gene which may be the cardiac p2y receptor involved in the regulation of cardiac muscle contraction through modulation of l- type calcium currents. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTB4R.

[21916] The function of LTB4R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.MAIL (Accession NM_031419.1) is another GAM136 target gene, herein designated TARGET GENE. MAIL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAIL BINDING SITE, designated SEQ ID:6513, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21917] Another function of GAM136 is therefore inhibition of MAIL (Accession NM_031419.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAIL.

[21918] Male germ cell-associated kinase (MAK, Accession NM_005906.2) is another GAM136 target gene, herein designated TARGET GENE. MAK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAK BINDING SITE, designated SEQ ID:19152, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21919] Another function of GAM136 is therefore inhibition of Male germ cell-associated kinase (MAK, Accession NM_005906.2), a gene which plays an important role in spermatogenesis. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAK.

[21920] The function of MAK and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM30.1.Mannosidase, beta a, lysosomal-like (MANBAL, Accession NM_022077.2) is another GAM136 target gene, herein designated TARGET GENE. MANBAL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MANBAL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MANBAL BINDING SITE, designated SEQ ID:638, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21921] Another function of GAM136 is therefore inhibition of Mannosidase, beta a, lysosomal-like (MANBAL, Accession NM_022077.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MANBAL.

[21922] MGC10200 (Accession NM_145060.1) is another GAM136 target gene, herein designated TARGET GENE. MGC10200 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10200, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC10200 BINDING SITE, designated SEQ ID:8635, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21923] Another function of GAM136 is therefore inhibition of MGC10200 (Accession NM_145060.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10200.

[21924] MGC14289 (Accession NM_080660.1) is another GAM136 target gene, herein designated TARGET GENE. MGC14289 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14289, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14289 BINDING SITE, designated SEQ ID:11444, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21925] Another function of GAM136 is therefore inhibition of MGC14289 (Accession NM_080660.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC14289.

[21926] MGC15873 (Accession NM_032920.1) is another GAM136 target gene, herein designated TARGET GENE. MGC15873 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC15873, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15873 BINDING SITE, designated SEQ ID:2473, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21927] Another function of GAM136 is therefore inhibition of MGC15873 (Accession NM_032920.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15873.

[21928] MGC1842 (Accession XM_037797.4) is another GAM136 target gene, herein designated TARGET GENE. MGC1842 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC1842, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC1842 BINDING SITE, designated SEQ ID:7188, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21929] Another function of GAM136 is therefore inhibition of MGC1842 (Accession XM_037797.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842.

[21930] MGC2474 (Accession NM_023931.1) is another GAM136 target gene, herein designated TARGET GENE. MGC2474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:15463, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21931] Another function of GAM136 is therefore inhibition of MGC2474 (Accession NM_023931.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474.

[21932] MGC3329 (Accession NM_024086.2) is another GAM136 target gene, herein designated TARGET GENE. MGC3329 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3329, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3329 BINDING SITE, designated SEQ ID:12427, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21933] Another function of GAM136 is therefore inhibition of MGC3329 (Accession NM_024086.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3329.

[21934] MGC4638 (Accession) is another GAM136 target gene, herein designated TARGET GENE. MGC4638 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4638, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4638 BINDING SITE, designated SEQ ID:3737, to the nucleotide

sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21935] Another function of GAM136 is therefore inhibition of MGC4638 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4638.

[21936] Nadh dehydrogenase (ubiquinone) 1 beta subcomplex, 1, 7kda (NDUFB1, Accession NM_004545.2) is another GAM136 target gene, herein designated TARGET GENE. NDUFB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NDUFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDUFB1 BINDING SITE, designated SEQ ID:2538, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21937] Another function of GAM136 is therefore inhibition of Nadh dehydrogenase (ubiquinone) 1 beta subcomplex, 1, 7kda (NDUFB1, Accession NM_004545.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFB1.

[21938] Nadh dehydrogenase (ubiquinone) 1, subcomplex unknown, 2, 14.5kda (NDUFC2, Accession NM_004549.2) is another GAM136 target gene, herein designated TARGET GENE. NDUFC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NDUFC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDUFC2 BINDING SITE, designated SEQ ID:8439, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21939] Another function of GAM136 is therefore inhibition of Nadh dehydrogenase (ubiquinone) 1, subcomplex unknown, 2, 14.5kda (NDUFC2, Accession NM_004549.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFC2.

[21940] NPR2L (Accession NM_006545.3) is another GAM136 target gene, herein designated TARGET GENE. NPR2L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPR2L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of NPR2L BINDING SITE, designated SEQ ID:6977, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21941] Another function of GAM136 is therefore inhibition of NPR2L (Accession NM_006545.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPR2L.

[21942] Nucleoredoxin (NXN, Accession NM_022463.2) is another GAM136 target gene, herein designated TARGET GENE. NXN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NXN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:15417, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21943] Another function of GAM136 is therefore inhibition of Nucleoredoxin (NXN, Accession NM_022463.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN.

[21944] Origin recognition complex, subunit 1-like (yeast) (ORC1L, Accession NM_004153.1) is another GAM136 target gene, herein designated TARGET GENE. ORC1L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ORC1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ORC1L BINDING SITE, designated SEQ ID:11234, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21945] Another function of GAM136 is therefore inhibition of Origin recognition complex, subunit 1-like (yeast) (ORC1L, Accession NM_004153.1), a gene which may be required for initiation of DNA replication. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORC1L.

[21946] The function of ORC1L has been established by previous studies. In the yeast Saccharomyces cerevisiae, DNA replication is initiated by the origin of replication complex (ORC), a 6- subunit protein. All 6 genes encoding this complex (ORC1 through ORC6) are essential for viability in yeast. Yeast ORC1 encodes the largest subunit of the ORC

and contains a cell division cycle- nucleoside triphosphate binding domain that is conserved among several yeast transcriptional regulators. Gavin et al. (1995) used degenerate PCR to clone a human homolog of the yeast ORC1 gene. The human ORC1 gene encodes an 861- amino acid protein that is 27% identical to yeast Orc1. Gavin et al. (1995) showed that ORC1 and ORC2 (ORC2L; 601182) can be coimmunoprecipitated, suggesting that they form a complex in vivo. Ohtani et al. (1996) showed that expression of human ORC1 is low in quiescent fibroblast cells and is induced by cell growth stimulation. They found that this control of expression is mediated by E2F (see OMIM Ref. No. 189971) transcriptional repression of the ORC1 promoter in quiescent cells. Activation of ORC1 transcription required G1 cyclin- dependent kinase activity. Ohtani et al. (1996) concluded that there is a direct link between the initiation of DNA replication and the cell growth regulatory pathway involving G1 cyclin- dependent kinase, the Rb tumor suppressor, and E2F.

[21947]

[21948] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21949] Gavin, K. A.; Hidaka, M.; Stillman, B. : Conserved initiator proteins in eukaryotes. Science 270: 1667- 1671, 1995. ; and

[21950] Ohtani, K.; DeGregori, J.; Leone, G.; Herendeen, D. R.; Kelly, T. J.; Nevins, J. R. : Expression of the HsOrc1 gene, a human ORC1 homolog, is regulated by cell proliferation via the E2F.

[21951] Further studies establishing the function and utilities of ORC1L are found in John Hopkins OMIM database record ID 601902, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pas domain containing serine/threonine kinase (PASK, Accession NM_015148.1) is another GAM136 target gene, herein designated TARGET GENE. PASK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PASK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PASK BINDING SITE, designated SEQ ID:17796, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21952] Another function of GAM136 is therefore inhibition of Pas

domain containing serine/threonine kinase (PASK, Accession NM_015148.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PASK.

[21953] Protocadherin beta 11 (PCDHB11, Accession NM_018931.2) is another GAM136 target gene, herein designated TARGET GENE. PCDHB11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHB11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHB11 BINDING SITE, designated SEQ ID:17334, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21954] Another function of GAM136 is therefore inhibition of Protocadherin beta 11 (PCDHB11, Accession NM_018931.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB11.

[21955] Phosducin-like (PDCL, Accession NM_005388.2) is another GAM136 target gene, herein designated TARGET GENE. PDCL BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by PDCL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDCL BINDING SITE, designated SEQ ID:15813, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21956] Another function of GAM136 is therefore inhibition of Phosducin-like (PDCL, Accession NM_005388.2), a gene which may regulate G- protein signaling and similar to phosducins. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCL.

[21957] The function of PDCL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Pdz domain containing 1 (PDZK1, Accession NM_002614.2) is another GAM136 target gene, herein designated TARGET GENE. PDZK1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PDZK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of PDZK1 BINDING SITE, designated SEQ ID:13616, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21958] Another function of GAM136 is therefore inhibition of Pdz domain containing 1 (PDZK1, Accession NM_002614.2), a gene which is a contains PDZ interaction domains, interacts with MAP17, a protein involved in control of cell proliferation. and therefore may be associated with Autosomal dominant hypophosphatemic rickets. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Autosomal dominant hypophosphatemic rickets, and of other diseases and clinical conditions associated with PDZK1.

[21959] The function of PDZK1 has been established by previous studies. Custer et al. (1997) cloned a gene from rat kidney mRNA that encodes a protein regulated by dietary phosphate. They designated the protein Diphor- 1 (dietary P(i)- regulated RNA- 1) and found that it shares homology with the PDZ domain- containing protein Na+/H+ exchanger regulatory factor. Diphor- 1 specifically increased Na(+)- dependent phosphate uptake by 1.7 times when coexpressed in Xenopus laevis oocytes with the Na(+)-

P(i) cotransporter, indicating that it may play an important role in cellular phosphate regulation. Diphor- 1 mRNA expression was upregulated several fold by a restricted phosphate diet, highlighting the possible role of the protein in maintaining overall phosphate homeostasis. White et al. (1998) showed that PDZK1, a PDZ domain- containing protein highly homologous to rat Diphor- 1, is expressed in human kidney. Based on its sequence similarity to rat Diphor- 1, they considered PDZK1 a likely candidate for autosomal dominant hypophosphatemic rickets (ADHR; 193108), which maps to 12p13. However, they found by PCR analysis of a human/rodent somatic cell hybrid mapping panel and by radiation hybrid analysis that the PDZK1 gene maps to 1q21, thereby excluding it as a candidate for ADHR.

[21960]

[21961] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21962] Kocher, O.; Comella, N.; Tognazzi, K.; Brown, L. F. : Identification and partial characterization of PDZK1: a novel protein containing PDZ interaction domains. Lab. Invest. 78: 117- 125, 1998. ; and

[21963] Ikemoto, M.; Arai, H.; Feng, D.; Tanaka, K.; Aoki, J.; Dohmae, N.; Takio, K.; Adachi, H.; Tsujimoto, M.; Inoue, K. : Identification of a PDZ- domain- containing protein that interacts with.

[21964] Further studies establishing the function and utilities of PDZK1 are found in John Hopkins OMIM database record ID 603831, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pellino homolog 1 (drosophila) (PELI1, Accession NM_020651.2) is another GAM136 target gene, herein designated TARGET GENE. PELI1 BINDING SITE1 and PELI1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PELI1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PELI1 BINDING SITE1 and PELI1 BINDING SITE2, designated SEQ ID:18940 and SEQ ID:7342 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21965] Another function of GAM136 is therefore inhibition of Pellino homolog 1 (drosophila) (PELI1, Accession NM_020651.2) . Accordingly, utilities of GAM136 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI1.

[21966] Phosphoinositide-3-kinase, class 2, beta polypeptide (PIK3C2B, Accession NM_002646.2) is another GAM136 target gene, herein designated TARGET GENE. PIK3C2B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PIK3C2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:18311, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21967] Another function of GAM136 is therefore inhibition of Phosphoinositide-3-kinase, class 2, beta polypeptide (PIK3C2B, Accession NM_002646.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B.

[21968] Phosphoinositide-3-kinase, catalytic, delta polypeptide (PIK3CD, Accession NM_005026.2) is another GAM136 target gene, herein designated TARGET GENE. PIK3CD BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by PIK3CD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIK3CD BINDING SITE, designated SEQ ID:17678, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21969] Another function of GAM136 is therefore inhibition of Phosphoinositide-3-kinase, catalytic, delta polypeptide (PIK3CD, Accession NM_005026.2), a gene which regulating cell growth. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3CD.

[21970] The function of PIK3CD has been established by previous studies. Vanhaesebroeck et al. (1997) classified p110-delta as a class I PI3K because it displayed broad in vitro lipid substrate specificity. Like p110- alpha and p110-beta, p110- delta binds p85 adaptor proteins and GTP-bound Ras. These 3 class I PI3Ks were indistinguishable at the level of p85 adaptor protein selection or recruitment to activated receptor complexes. However, unlike p110-alpha, p110- delta does not phosphorylate p85, but instead has an autophosphorylation activity

[21971] Animal model experiments lend further support to the function of PIK3CD. Okkenhaug et al. (2002) generated mice expressing a catalytically inactive form of Pik3cd (asp910 to ala). They observed impaired signaling and attenuated immune responses by antigen receptors of B and T cells from these mice. The presence of Pik3ca and Pik3cb did not compensate for Pik3cd in immune function. The mutant mice also developed inflammatory bowel disease. Since the IBD7 susceptibility locus (OMIM Ref. No. 605225) maps to chromosome 1p36, the authors suggested that PIK3CD may be a candidate susceptibility gene

[21972] It is appreciated that the abovementioned animal model for PIK3CD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[21973] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21974] Okkenhaug, K.; Bilancio, A.; Farjot, G.; Priddle, H.; Sancho, S.; Peskett, E.; Pearce, W.; Meek, S. E.; Salpekar, A.; Waterfield, M. D.; Smith, A. J. H.; Vanhaesebroeck, B. : Impaired B and T cell antigen receptor signaling in p110- delta PI 3- kinase mutant mice. Science 297: 1031- 1034, 2002. ;

and

[21975] Vanhaesebroeck, B.; Welham, M. J.; Kotani, K.; Stein, R.; Warne, P. H.; Zvelebil, M. J.; Higashi, K.; Volinia, S.; Downward, J.; Waterfield, M. D. : p110- delta, a novel phosphoinositide 3- .

[21976] Further studies establishing the function and utilities of PIK3CD are found in John Hopkins OMIM database record ID 602839, and in cited publications listed in Table 5, which are hereby incorporated by reference.PIP3-E (Accession) is another GAM136 target gene, herein designated TARGET GENE. PIP3-E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIP3-E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:12706, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21977] Another function of GAM136 is therefore inhibition of PIP3-E (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E.

[21978] Pro-melanin-concentrating hormone-like 1 (PMCHL1, Accession NM_031887.2) is another GAM136 target gene, herein designated TARGET GENE. PMCHL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PMCHL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMCHL1 BINDING SITE, designated SEQ ID:17289, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21979] Another function of GAM136 is therefore inhibition of Pro-melanin-concentrating hormone-like 1 (PMCHL1, Accession NM_031887.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMCHL1.

[21980] Peptidylprolyl isomerase d (cyclophilin d) (PPID, Accession NM_005038.1) is another GAM136 target gene, herein designated TARGET GENE. PPID BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PPID, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of PPID BINDING SITE, designated SEQ ID:8817, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21981] Another function of GAM136 is therefore inhibition of Peptidylprolyl isomerase d (cyclophilin d) (PPID, Accession NM_005038.1), a gene which catalyzes the cis- trans isomerization of proline imidic peptide bonds in oligopeptides. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPID.

[21982] The function of PPID has been established by previous studies. The cyclophilins are a conserved gene family of peptidyl- prolyl cis- trans isomerases (PPIases; OMIM Ref. No. 123840), the members of which bind the immunosuppressant cyclosporin A. Cyclophilin 40 (CyP- 40, also CYPD) was identified by Kieffer et al. (1992) as a 40- kD cyclophilin- like protein with PPIase activity. In the bovine uterus, CyP- 40 is a component of the estrogen receptor complex (see OMIM Ref. No. 133430). Kieffer et al. (1993) reported the cloning of a human cDNA homologous to the bovine CyP- 40. The cDNA encodes a predicted 370- amino acid protein. The amino end is similar to that of other cyclophilins, while the carboxyl region resembles

FKBP59 (OMIM Ref. No. 600611), a component of the glucocorticoid receptor complex. Yokoi et al. (1996) showed that the cyclophilin 40 (or PPID) gene contains 10 exons and spans 14.2 kb of genomic DNA. Ten Alu repeats occur within noncoding regions of the gene. Yokoi et al. (1996) mapped the PPID gene to chromosome 4 using a panel of somatic cell hybrid DNAs. By fluorescence in situ hybridization, Ratajczak et al. (1997) mapped the PPID gene to 4q31.3.

[21983]

[21984] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21985] Ratajczak, T.; Woollatt, E.; Kumar, P.; Ward, B. K.; Minchin, R. F.; Baker, E. : Cyclophilin 40 (PPID) gene map position 4q31.3. Chromosome Res. 5: 151 only, 1997. ; and

[21986] Yokoi, H.; Shimizu, Y.; Anazawa, H.; Lefebvre, C. A.; Korneluk, R. G.; Ikeda; J.- E. : The structure and complete nucleotide sequence of the human cyclophilin 40 (PPID) gene. Genomics 35:.

[21987] Further studies establishing the function and utilities of PPID are found in John Hopkins OMIM database record ID 601753, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Protein kinase, interferon-inducible double stranded rna dependent (PRKR, Accession NM_002759.1) is another GAM136 target gene, herein designated TARGET GENE. PRKR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKR BINDING SITE, designated SEQ ID:7341, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21988] Another function of GAM136 is therefore inhibition of Protein kinase, interferon-inducible double stranded rna dependent (PRKR, Accession NM_002759.1), a gene which catalyze the phosphorylation of the alpha subunit of eif2. and therefore may be associated with Huntington's disease. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Huntington's disease, and of other diseases and clinical conditions associated with PRKR.

[21989] The function of PRKR has been established by previous studies. Ben- Asouli et al. (2002) showed that human

gamma- interferon (IFNG; 147570) mRNA uses local activation of PKR in the cell to control its own translation yield. IFNG mRNA was found to activate PKR through a pseudoknot in its 5- prime untranslated region. Mutations that impaired pseudoknot stability reduced the ability to activate PKR and strongly increased the translation efficiency of IFNG mRNA. Nonphosphorylatable mutant eIF2-alpha, knockout of PKR, and the PKR inhibitors 2-aminopurine, transdominant- negative PKR, or vaccinia E3L correspondingly enhanced translation of IFNG mRNA. The potential to form the pseudoknot was found to be phylogenetically conserved. Ben- Asouli et al. (2002) proposed that the RNA pseudoknot acts to adjust translation of IFNG mRNA to the PKR level expressed in the cell. Barber et al. (1993) mapped the PRKR gene to 2p21 by in situ hybridization. The corresponding mouse gene was mapped to chromosome 17 (band E2) by the same method. Squire et al. (1993) assigned the PRKR gene to the boundary between 2p22 and 2p21 by fluorescence in situ hybridization. Taylor et al. (1999) studied the mechanism underlying the resistance of hepatitis C virus (HCV) to interferon. They demonstrated that the HCV envelope protein E2 contains a sequence identical with phosphory-

lation sites of the interferon- inducible protein kinase PKR and the translation initiation factor EIF2- alpha, a target of PKR. E2 inhibited the kinase activity of PKR and blocked its inhibitory effect on protein synthesis and cell growth. This interaction of E2 in PKR may be one mechanism by which HCV circumvents the antiviral effect of interferon. Taylor et al. (1999) hypothesized that another potential outcome of PKR inhibition is the promotion of cell growth which may contribute to HCV- associated hepatocellular carcinoma. Huntington disease (OMIM Ref. No. 143100) is a neurodegenerative disorder caused by a trinucleotide repeat expansion within the huntingtin gene, resulting in generation of a polyglutamine tract in the protein product. Peel et al. (2001) showed that PKR preferentially bound mutant huntingtin RNA transcripts immobilized on streptavidin columns that had been incubated with human brain extracts. Immunohistochemical studies demonstrated that PKR was present in its activated form in both human Huntington autopsy material and brain tissue derived from Huntington yeast artificial chromosome transgenic mice. The increased immunolocalization of the activated kinase was more pronounced in areas most affected by the disease. The authors suggested a role for PKR acti-

vation in the Huntington disease process.

[21990]

[21991] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21992] Ben- Asouli, Y.; Banai, Y.; Pel- Or, Y.; Shir, A.; Kaempfer, R. : Human interferon- gamma mRNA autoregulates its translation through a pseudoknot that activates the interferon- inducible protein kinase PKR. Cell 108: 221- 232, 2002. ; and

[21993] Peel, A. L.; Rao, R. V.; Cottrell, B. A.; Hayden, M. R.; Ellerby, L. M.; Bredesen, D. E. : Double- stranded RNA-dependent protein kinase, PKR, binds preferentially to Huntington's diseas.

[21994] Further studies establishing the function and utilities of PRKR are found in John Hopkins OMIM database record ID 176871, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRO0365 (Accession NM_014126.1) is another GAM136 target gene, herein designated TARGET GENE. PRO0365 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0365, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15753, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21995] Another function of GAM136 is therefore inhibition of PRO0365 (Accession NM_014126.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365.

[21996] PRO1992 (Accession) is another GAM136 target gene, herein designated TARGET GENE. PRO1992 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO1992, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1992 BINDING SITE, designated SEQ ID:4868, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21997] Another function of GAM136 is therefore inhibition of PRO1992 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with PRO1992.

[21998] Proteasome (prosome, macropain) subunit, beta type, 2 (PSMB2, Accession NM_002794.3) is another GAM136 target gene, herein designated TARGET GENE. PSMB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSMB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSMB2 BINDING SITE, designated SEQ ID:15555, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[21999] Another function of GAM136 is therefore inhibition of Proteasome (prosome, macropain) subunit, beta type, 2 (PSMB2, Accession NM_002794.3) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMB2.

[22000] Proline-serine-threonine phosphatase interacting protein 2 (PSTPIP2, Accession NM_024430.2) is another GAM136 target gene, herein designated TARGET GENE. PSTPIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSTPIP2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSTPIP2 BINDING SITE, designated SEQ ID:2794, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22001] Another function of GAM136 is therefore inhibition of Proline-serine-threonine phosphatase interacting protein 2 (PSTPIP2, Accession NM_024430.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSTPIP2.

[22002] Prostaglandin e synthase (PTGES, Accession NM_004878.2) is another GAM136 target gene, herein designated TARGET GENE. PTGES BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGES, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGES BINDING SITE, designated SEQ ID:2996, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22003] Another function of GAM136 is therefore inhibition of Prostaglandin e synthase (PTGES, Accession

NM_004878.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGES.

[22004] Rab21, member ras oncogene family (RAB21, Accession NM_014999.1) is another GAM136 target gene, herein designated TARGET GENE. RAB21 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB21 BINDING SITE, designated SEQ ID:18931, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22005] Another function of GAM136 is therefore inhibition of Rab21, member ras oncogene family (RAB21, Accession NM_014999.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB21.

[22006] Rab39, member ras oncogene family (RAB39, Accession XM_084662.2) is another GAM136 target gene, herein designated TARGET GENE. RAB39 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by RAB39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:4443, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22007] Another function of GAM136 is therefore inhibition of Rab39, member ras oncogene family (RAB39, Accession XM_084662.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39.

[22008] Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NM_014737.1) is another GAM136 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:8520, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22009] Another function of GAM136 is therefore inhibition of Ras

association (ralgds/af-6) domain family 2 (RASSF2, Accession NM_014737.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[22010] Rna binding motif protein 8a (RBM8A, Accession NM_005105.2) is another GAM136 target gene, herein designated TARGET GENE. RBM8A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBM8A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:18760, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22011] Another function of GAM136 is therefore inhibition of Rna binding motif protein 8a (RBM8A, Accession NM_005105.2), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM8A.

[22012] The function of RBM8A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.RNO2 (Accession) is another GAM136 target gene, herein designated TARGET GENE. RNO2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RNO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNO2 BINDING SITE, designated SEQ ID:11666, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22013] Another function of GAM136 is therefore inhibition of RNO2 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNO2.

[22014] RPP30 (Accession NM_006413.2) is another GAM136 target gene, herein designated TARGET GENE. RPP30 BINDING SITE1 and RPP30 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by RPP30, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE1 and RPP30 BINDING SITE2, designated SEQ ID:669 and SEQ ID:415 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22015] Another function of GAM136 is therefore inhibition of RPP30 (Accession NM_006413.2), a gene which is a component of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30.

[22016] The function of RPP30 has been established by previous studies. By biochemical purification of RNase P, micropeptide sequence analysis, and EST database searching, Eder et al. (1997) obtained a cDNA encoding RPP30. The deduced protein contains 268 amino acids with a predicted molecular mass of nearly 30 kD. Jarrous et al. (1998) determined that RPP30 is a target for antisera from systemic sclerosis patients. Immunoprecipitation analysis showed that polyclonal antibodies raised against RPP20, RPP30, RPP38, or RPP40 interact with RNase P from HeLa cells.

[22017]

[22018] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[22019] Eder, P. S.; Kekuda, R.; Stolc, V.; Altman, S. : Characterization of two scleroderma autoimmune antigens that copurify with human ribonuclease P. Proc. Nat. Acad. Sci. 94: 1101- 1106, 1997. ; and

[22020] Jarrous, N.; Eder, P. S.; Guerrier- Takada, C.; Hoog, C.; Altman, S. : Autoantigenic properties of some protein subunits of catalytically active complexes of human ribonuclease P. RNA 4: 407.

[22021] Further studies establishing the function and utilities of RPP30 are found in John Hopkins OMIM database record ID 606115, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sterol-c4-methyl oxidase-like (SC4MOL, Accession NM_006745.2) is another GAM136 target gene, herein designated TARGET GENE. SC4MOL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SC4MOL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SC4MOL BINDING SITE, designated SEQ ID:8501, to the nucleotide se-

quence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22022] Another function of GAM136 is therefore inhibition of Sterol-c4-methyl oxidase-like (SC4MOL, Accession NM_006745.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SC4MOL.

[22023] Sex comb on midleg-like 2 (drosophila) (SCML2, Accession NM_006089.1) is another GAM136 target gene, herein designated TARGET GENE. SCML2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCML2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCML2 BINDING SITE, designated SEQ ID:9298, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22024] Another function of GAM136 is therefore inhibition of Sex comb on midleg-like 2 (drosophila) (SCML2, Accession NM_006089.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML2.

[22025] SCYA22 (Accession) is another GAM136 target gene, herein designated TARGET GENE. SCYA22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCYA22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCYA22 BINDING SITE, designated SEQ ID:13867, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22026] Another function of GAM136 is therefore inhibition of SCYA22 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA22.

[22027] Spondyloepiphyseal dysplasia, late (SEDL, Accession NM_014563.1) is another GAM136 target gene, herein designated TARGET GENE. SEDL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEDL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE, designated SEQ ID:18071, to the nucleotide sequence of GAM136

RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22028] Another function of GAM136 is therefore inhibition of Spondyloepiphyseal dysplasia, late (SEDL, Accession NM_014563.1), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. and therefore may be associated with Spondyloepiphyseal dysplasia. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Spondyloepiphyseal dysplasia, and of other diseases and clinical conditions associated with SEDL.

[22029] The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 5a (SEMA5A, Accession NM_003966.1) is another GAM136 target gene, herein designated TARGET GENE. SEMA5A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SEMA5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of SEMA5A BINDING SITE, designated SEQ ID:11943, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22030] Another function of GAM136 is therefore inhibition of Sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 5a (SEMA5A, Accession NM_003966.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA5A.

[22031] Selenoprotein n, 1 (SEPN1, Accession NM_020451.1) is another GAM136 target gene, herein designated TARGET GENE. SEPN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEPN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEPN1 BINDING SITE, designated SEQ ID:17169, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22032] Another function of GAM136 is therefore inhibition of Selenoprotein n, 1 (SEPN1, Accession NM_020451.1) . Ac-

cordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPN1.

[22033] Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NM_022978.1) is another GAM136 target gene, herein designated TARGET GENE. SERF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE, designated SEQ ID:18926, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22034] Another function of GAM136 is therefore inhibition of Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NM_022978.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B.

[22035] Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 9 (SERPINB9, Accession NM_004155.2) is another GAM136 target gene, herein designated TARGET GENE. SERPINB9 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by SERPINB9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:6595, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22036] Another function of GAM136 is therefore inhibition of Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 9 (SERPINB9, Accession NM_004155.2), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9.

[22037] The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM88.2.Sh3-domain binding protein 2 (SH3BP2, Accession NM_003023.2) is another GAM136 target gene, herein designated TARGET GENE. SH3BP2 BINDING SITE is a target binding site found in the 3` untranslated region

of mRNA encoded by SH3BP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:19004, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22038] Another function of GAM136 is therefore inhibition of Sh3-domain binding protein 2 (SH3BP2, Accession NM_003023.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2.

[22039] Tal1 (scl) interrupting locus (SIL, Accession NM_003035.1) is another GAM136 target gene, herein designated TARGET GENE. SIL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIL BINDING SITE, designated SEQ ID:10047, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22040] Another function of GAM136 is therefore inhibition of

Tal1 (scl) interrupting locus (SIL, Accession NM_003035.1), a gene which may be required for axial development and left- right specification and therefore may be associated with Prominent midline neural tube defects, abnormal left- right development. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Prominent midline neural tube defects, abnormal left- right development, and of other diseases and clinical conditions associated with SIL.

[22041] The function of SIL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Solute carrier family 14 (urea transporter), member 2 (SLC14A2, Accession NM_007163.2) is another GAM136 target gene, herein designated TARGET GENE. SLC14A2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC14A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:9752, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22042] Another function of GAM136 is therefore inhibition of Solute carrier family 14 (urea transporter), member 2 (SLC14A2, Accession NM_007163.2), a gene which is a renal urea transporter 2. and therefore may be associated with Orthostatic hypotension. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Orthostatic hypotension, and of other diseases and clinical conditions associated with SLC14A2.

[22043] The function of SLC14A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM97.1.Solute carrier family 16 (monocarboxylic acid transporters), member 4 (SLC16A4, Accession NM_004696.1) is another GAM136 target gene, herein designated TARGET GENE. SLC16A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC16A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC16A4 BINDING SITE, designated SEQ ID:17675, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22044] Another function of GAM136 is therefore inhibition of Solute carrier family 16 (monocarboxylic acid transporters), member 4 (SLC16A4, Accession NM_004696.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A4.

[22045] Solute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NM_030777.2) is another GAM136 target gene, herein designated TARGET GENE. SLC2A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A10 BINDING SITE, designated SEQ ID:15101, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22046] Another function of GAM136 is therefore inhibition of Solute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NM_030777.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with SLC2A10.

[22047] SMAC (Accession NM_138929.1) is another GAM136 target gene, herein designated TARGET GENE. SMAC BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SMAC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:11007, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22048] Another function of GAM136 is therefore inhibition of SMAC (Accession NM_138929.1), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC.

[22049] The function of SMAC has been established by previous studies. Verhagen et al. (2000) identified the murine homolog of SMAC, which they called DIABLO (direct IAP-binding protein with low pI). They showed that DIABLO can bind mammalian IAP homolog A (MIHA, or API3) and can also interact with MIHB (API1; 601712), MIHC (API2; 601721), and OpIAP, the baculoviral IAP. Immunoprecipi-

tation and Western blot analysis indicated that the N- terminally processed, IAP- interacting form of DIABLO is concentrated in membrane fractions in healthy cells but is released into the MIHA- containing cytosolic fractions upon ultraviolet (UV) irradiation. Since transfection of cells with DIABLO was able to counter the protection afforded by MIHA against UV irradiation, the authors suggested that DIABLO may promote apoptosis by binding to IAPs and preventing them from inhibiting caspases. Chai et al. (2000) showed that SMAC/DIABLO promotes not only the proteolytic activation of procaspase- 3, but also the enzymatic activity of mature caspase- 3, both of which depend upon its ability to interact physically with IAPs.

[22050] Animal model experiments lend further support to the function of SMAC. Okada et al. (2002) generated Diablo-deficient mice by homologous recombination. Western blot analysis confirmed the null mutation. The mice were fertile and appeared grossly normal at more than 1 year of age, and histologic analysis failed to detect any abnormalities. In vitro analysis indicated an inhibition of procaspase- 3 (CASP3; 600636) cleavage in Diablo - /- cell lysates, but all types of Diablo - /- cells tested responded normally to a number of apoptotic stimuli. Fas (OMIM Ref.

No. 134637)- mediated apoptosis in liver was also normal in vivo in these mice. The authors concluded that a redundant molecule, possibly Omi (PRSS25; 606441), or molecules are capable of compensating for the loss of Diablo function. Alternatively, they suggested that Diablo may only regulate programmed cell death in specific situations or tissues not yet identified.

[22051] It is appreciated that the abovementioned animal model for SMAC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22052] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22053] Okada, H.; Suh, W.- K.; Jin, J.; Woo, M.; Du, C.; Elia, A.; Duncan, G. S.; Wakeham, A.; Itie, A.; Lowe, S. W.; Wang, X.; Mak, T. W. : Generation and characterization of Smac/DIABLO- deficient mice. Molec. Cell. Biol. 22: 3509- 3517, 2002. ; and

[22054] Verhagen, A. M.; Ekert, P. G.; Pakusch, M.; Silke, J.; Connolly, L. M.; Reid, G. E.; Moritz, R. L.; Simpson, R. J.; Vaux, D. L. : Identification of DIABLO, a mammalian protein that promote.

[22055] Further studies establishing the function and utilities of SMAC are found in John Hopkins OMIM database record ID 605219, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synaptosomal-associated protein, 23kda (SNAP23, Accession NM_003825.2) is another GAM136 target gene, herein designated TARGET GENE. SNAP23 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNAP23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE, designated SEQ ID:3908, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22056] Another function of GAM136 is therefore inhibition of Synaptosomal-associated protein, 23kda (SNAP23, Accession NM_003825.2), a gene which is essential component of the high affinity receptor for the general membrane fusion machinery. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23.

[22057] The function of SNAP23 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Sorting nexin 15 (SNX15, Accession NM_013306.2) is another GAM136 target gene, herein designated TARGET GENE. SNX15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX15 BINDING SITE, designated SEQ ID:10190, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22058] Another function of GAM136 is therefore inhibition of Sorting nexin 15 (SNX15, Accession NM_013306.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX15.

[22059] SQV7L (Accession XM_047287.2) is another GAM136 target gene, herein designated TARGET GENE. SQV7L BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SQV7L, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SQV7L BINDING SITE, designated SEQ ID:5878, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22060] Another function of GAM136 is therefore inhibition of SQV7L (Accession XM_047287.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SQV7L.

[22061] SS-56 (Accession NM_018073.4) is another GAM136 target gene, herein designated TARGET GENE. SS-56 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SS-56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:15880, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22062] Another function of GAM136 is therefore inhibition of SS-56 (Accession NM_018073.4) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS-56.

[22063] SUN1 (Accession) is another GAM136 target gene, herein designated TARGET GENE. SUN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SUN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUN1 BINDING SITE, designated SEQ ID:16363, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22064] Another function of GAM136 is therefore inhibition of SUN1 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUN1.

[22065] Tap binding protein (tapasin) (TAPBP, Accession NM_003190.3) is another GAM136 target gene, herein designated TARGET GENE. TAPBP BINDING SITE1 and TAPBP BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TAPBP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE1 and TAPBP

BINDING SITE2, designated SEQ ID:7038 and SEQ ID:5937 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22066] Another function of GAM136 is therefore inhibition of Tap binding protein (tapasin) (TAPBP, Accession NM_003190.3), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP.

[22067] The function of TAPBP has been established by previous studies. Newly assembled major histocompatibility complex (MHC) class I molecules (see OMIM Ref. No. 142800), together with the endoplasmic reticulum (ER) chaperone calreticulin (OMIM Ref. No. 109091), interact with the transporter associated with antigen processing (TAP1; 170260) through a molecule called tapasin (Sadasivan et al., 1996). By molecular cloning of tapasin, Ortmann et al. (1997) found it to be a type I transmembrane glycoprotein encoded by an MHC- linked gene. The mature protein has 428 amino acids with a single N- linked glycosylation site at position 233. It is a member of the immunoglobulin superfamily with a probable cytoplasmic ER retention signal. Up to 4 MHC class I/tapasin complexes were found to

bind to each TAP molecule in Daudi and L001 cells. Expression of tapasin in a negative mutant human cell line restored class I/TAP association and normal class I cell surface expression. Tapasin expression also corrected the defective recognition of virus- infected cells of the same line by class I- restricted cytotoxic T cells, thus establishing a critical functional role for tapasin in MHC class I- restricted antigen processing. Herberg et al. (1998) identified an EST encoding the mouse tapasin homolog. Mayer and Klein (2001) proposed that tapasin is in reality an MHC class I molecule with a different function from that currently executed by conventional class I molecules. They based this proposal on the amino acid sequence similarity between tapasin and conventional class I molecules, on similarity of predicted tertiary structure and domain organization of the molecules, on similarity of exon/intron organization of the encoding genes, and on the mapping of the class IA and tapasin genes into the same chromosomal region in all jawed vertebrates that had been tested to that time (Michalova et al., 2000).

[22068]

[22069] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[22070] Mayer, W. E.; Klein, J. : Is tapasin a modified Mhc class I molecule? Immunogenetics 53: 719- 723, 2001. ; and

[22071] Ortmann, B.; Copeman, J.; Lehner, P. J.; Sadasivan, B.; Herberg, J. A.; Grandea, A. G.; Riddell, S. R.; Tampe, R.; Spies, T.; Trowsdale, J.; Cresswell, P. : A critical role for tapasin.

[22072] Further studies establishing the function and utilities of TAPBP are found in John Hopkins OMIM database record ID 601962, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-cell leukemia/lymphoma 6 (TCL6, Accession NM_020553.2) is another GAM136 target gene, herein designated TARGET GENE. TCL6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE, designated SEQ ID:17772, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22073] Another function of GAM136 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession

NM_020553.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[22074] Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NM_003212.1) is another GAM136 target gene, herein designated TARGET GENE. TDGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TDGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TDGF1 BINDING SITE, designated SEQ ID:17005, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22075] Another function of GAM136 is therefore inhibition of Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NM_003212.1), a gene which can play a role in the determination of the epiblastic cells that subsequently give rise to the mesoderm. and therefore may be associated with Forebrain defects. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Forebrain defects, and of other diseases and clinical conditions associated with TDGF1.

[22076] The function of TDGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Telomeric repeat binding factor 2 (TERF2, Accession NM_005652.2) is another GAM136 target gene, herein designated TARGET GENE. TERF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TERF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TERF2 BINDING SITE, designated SEQ ID:17679, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22077] Another function of GAM136 is therefore inhibition of Telomeric repeat binding factor 2 (TERF2, Accession NM_005652.2), a gene which plays a key role in the protective activity of telomeres. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERF2.

[22078] The function of TERF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM133.2.TIM3 (Accession) is another GAM136 target gene, herein designated TARGET GENE. TIM3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TIM3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIM3 BINDING SITE, designated SEQ ID:19281, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22079] Another function of GAM136 is therefore inhibition of TIM3 (Accession), a gene which regulates macrophage activation and enhances the severity of experimental autoimmune encephalomyelitis in mice. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIM3.

[22080] The function of TIM3 has been established by previous studies. By immunoscreening Th1 and Th2 cells with monoclonal antibodies derived from mouse Th1 cell- immunized rats, followed by gene- expression cloning, Monney et al. (2002) obtained a cDNA encoding mouse Tim3. By genomic database searching and RT- PCR, the authors isolated a cDNA encoding human TIM3. The de-

duced 301- amino acid type I membrane protein, 63% identical overall and 77% identical in the cytoplasmic domain, has an Ig variable- like domain, a mucin- like domain consisting of 31% serine and threonine residues, and a cytoplasmic domain with a tyrosine phosphorylation motif. Monney et al. (2002) noted that TIM3 is related to the hepatitis A virus cellular receptor (HAVCR1; 606518), also known as the kidney injury molecule (Kim1). Using flow cytometric and RT- PCR analysis, Monney et al. (2002) detected Tim3 only on activated Th1 cells and CD11b+ (ITGAM; 120980) macrophages. Cells expressing Tim3 predominate in the central nervous system of mice at the onset of experimental autoimmune encephalomyelitis (EAE), a Th1- mediated autoimmune disease. Anti- Tim3 treatment enhanced the clinical and pathologic severity of EAE and increased the number and activation level of macrophages. Monney et al. (2002) proposed that anti- Tim3 may trigger the production of proinflammatory cytokines in vivo and induce macrophage activation possibly by enhancing the migration of Th1 cells into the brain or by blocking an interaction between Tim3 and an inhibitory ligand.

[22081]

[22082] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22083] Monney, L.; Sabatos, C.; Gaglia, J. L.; Ryu, A.; Waldner, H.; Chernova, T.; Manning, S.; Greenfield, E. A.; Coyle, A. J.; Sobel, R. A.; Freeman, G. J.; Kuchroo, V. K. : Th1- specific cell surface protein regulates macrophage activation and severity of an autoimmune disease. Nature 415: 536-541, 2002. ; and

[22084] McIntire, J. J.; Umetsu, S. E.; Akbari, O.; Potter, M.; Kuchroo, V. K.; Barsh, G. S.; Freeman, G. J.; Umetsu, D. T.; DeKruyff, R. H. : Identification of Tapr (an airway hyperre-activity.

[22085] Further studies establishing the function and utilities of TIM3 are found in John Hopkins OMIM database record ID 606652, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tight junction pro-tein 1 (zona occludens 1) (TJP1, Accession NM_175610.1) is another GAM136 target gene, herein designated TAR-GET GENE. TJP1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TJP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TJP1 BINDING SITE, designated SEQ ID:4867, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22086] Another function of GAM136 is therefore inhibition of Tight junction protein 1 (zona occludens 1) (TJP1, Accession NM_175610.1), a gene which colocalizes and interacts with cadherins in cells lacking tight junctions. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP1.

[22087] The function of TJP1 has been established by previous studies. Tight junction (zonula occludens) protein 1 (TJP1), also referred to as ZO- 1, is a 200- kD protein located on a cytoplasmic membrane surface of vertebrate intercellular tight junctions. Willott et al. (1993) isolated a full-length cDNA sequence for human TJP1. Although the function of TJP1 is unknown, the cDNA sequence predicted a multi- domain signaling protein homologous to the product of the 'discs large- 1' tumor suppressor gene of Drosophila (OMIM Ref. No. 601014) and several other membrane- associated proteins in mammals. By fluores-

cence in situ hybridization using a cDNA probe, Mohandas et al. (1995) mapped TJP1 to 15q13. The Jackson Laboratory backcross DNA panel derived from interspecies crosses was used to map Tjp1 to mouse chromosome 7 in a region with conserved homology to 15q13. Fluorescence in situ hybridization studies on metaphases from patients with the Prader- Willi syndrome (OMIM Ref. No. 176270) and/or the Angelman syndrome (OMIM Ref. No. 105830) showed that TJP1 maps close but distal to the PWS/AS chromosome region.

[22088]

[22089] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22090] Mohandas, T. K.; Chen, X.- N.; Rowe, L. B.; Birkenmeier, E. H.; Fanning, A. S.; Anderson, J. M.; Korenberg, J. R. : Localization of the tight junction protein gene TJP1 to human chromosome 15q13, distal to the Prader- Willi/ Angelman region, and to mouse chromosome 7. Genomics 30: 594- 597, 1995. ; and

[22091] Willott, E.; Balda, M. S.; Fanning, A. S.; Jameson, B.; Van Itallie, C.; Anderson, J. M. : The tight junction protein ZO-1 is homologous to the Drosophila discs- large tumor

suppressor pr.

[22092] Further studies establishing the function and utilities of TJP1 are found in John Hopkins OMIM database record ID 601009, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transmembrane, cochlear expressed, 1 (TMC1, Accession NM_138691.2) is another GAM136 target gene, herein designated TARGET GENE. TMC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TMC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMC1 BINDING SITE, designated SEQ ID:10094, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22093] Another function of GAM136 is therefore inhibition of Transmembrane, cochlear expressed, 1 (TMC1, Accession NM_138691.2), a gene which is required for normal function of cochlear hair cells and therefore may be associated with Autosomal recessive nonsyndromic neurosensory deafness and autosomal dominant nonsyndromic sensorineural hearing loss . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Autosomal

recessive nonsyndromic neurosensory deafness and autosomal dominant nonsyndromic sensorineural hearing loss ., and of other diseases and clinical conditions associated with TMC1.

[22094] The function of TMC1 has been established by previous studies. By positional cloning, Kurima et al. (2002) identified the gene mutant in a form of autosomal dominant deafness (DFNA36; 606705) and of recessive deafness (DFNB7/B11; 600974) that map to the same interval on 9q13- q21. The authors evaluated several candidate genes in the critical region but found no mutations in the deaf families. To identify additional DFNA36/B7/B11 candidate genes based upon sequence similarity to related genes elsewhere in the genome, they initiated a systematic BLAST analysis of segments of genomic DNA sequence in the critical region. One sequence was found to be similar to a predicted gene (subsequently named TMC2; 606707) on 20p13. They used conserved sequences between TMC2 and the query sequence (subsequently named TMC1) on chromosome 9q13- q21 to design primers for amplifying potential TMC1 transcripts from a human fetal brain cDNA library. Kurima et al. (2002) found the longest open reading frame to be

2,283 nucleotides, predicting an 87- kD protein. The TMC1 protein is predicted to contain 6 transmembrane domains and to have cytoplasmic orientation of N and C termini. Kurima et al. (2002) obtained the orthologous mouse Tmc1 cDNA by RT- PCR and 5- prime and 3- prime RACE of mouse inner- ear cDNA. They found that in the mouse, Tmc1 mRNA is expressed in hair cells of the postnatal cochlea and vestibular end organs and is required for normal function of cochlear hair cells.

[22095] Animal model experiments lend further support to the function of TMC1. Vreugde et al. (2002) identified a missense mutation in the Tmc1 gene in the mouse deaf mutant 'Beethoven' (Bth). Thus it is a mouse model for autosomal dominant progressive hearing loss (DFNA36; 606705). Similarly, the recessive deafness mutation dn, which maps to mouse chromosome 19, is a model of profound congenital deafness caused by mutations in the TMC1 gene: DFNB7 (OMIM Ref. No. 600974), also known as DFNB11.

[22096] It is appreciated that the abovementioned animal model for TMC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22097] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22098] Kurima, K.; Peters. L. M.; Yang, Y.; Riazuddin, S.; Ahmed, Z. M.; Naz, S.; Arnaud, D.; Drury, S.; Mo, J.; Makishima, T.; Ghosh, M.; Menon, P. S. N.; and 13 others : Dominant and recessive deafness caused by mutations of a novel gene, TMC1, required for cochlear hair- cell function. Nature Genet. 30: 277- 284, 2002. ; and

[22099] Vreugde, S.; Erven, A.; Kros, C. J.; Marcotti, W.; Fuches, H.; Kurima, K.; Wilcox, E. R.; Friedman, T. B.; Griffith, A. J.; Balling, R.; de Angelis, M. H.; Avraham, K. B.; Steel, K. P.

[22100] Further studies establishing the function and utilities of TMC1 are found in John Hopkins OMIM database record ID 606706, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NM_147187.1) is another GAM136 target gene, herein designated TARGET GENE. TNFRSF10B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF10B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:16066, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22101] Another function of GAM136 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NM_147187.1), a gene which forms complex that induces apoptosis. and therefore may be associated with Squamous cell carcinoma . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of Squamous cell carcinoma ., and of other diseases and clinical conditions associated with TNFRSF10B.

[22102] The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Tumor protein p53 (li-fraumeni syndrome) (TP53, Accession NM_000546.2) is another GAM136 target gene, herein designated TARGET GENE. TP53 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TP53, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TP53 BINDING SITE, designated SEQ ID:9481, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22103] Another function of GAM136 is therefore inhibition of Tumor protein p53 (li-fraumeni syndrome) (TP53, Accession NM_000546.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53.

[22104] Tripartite motif-containing 5 (TRIM5, Accession NM_033034.1) is another GAM136 target gene, herein designated TARGET GENE. TRIM5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRIM5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM5 BINDING SITE, designated SEQ ID:18339, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22105] Another function of GAM136 is therefore inhibition of Tripartite motif-containing 5 (TRIM5, Accession

NM_033034.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM5.

[22106] Transient receptor potential cation channel, subfamily v, member 1 (TRPV1, Accession NM_080704.1) is another GAM136 target gene, herein designated TARGET GENE. TRPV1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRPV1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE, designated SEQ ID:4442, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22107] Another function of GAM136 is therefore inhibition of Transient receptor potential cation channel, subfamily v, member 1 (TRPV1, Accession NM_080704.1), a gene which functions as a receptor for capsaicin. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1.

[22108] The function of TRPV1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM130.1.TUCAN (Accession NM_014959.1) is another GAM136 target gene, herein designated TARGET GENE. TUCAN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TUCAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:5981, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22109] Another function of GAM136 is therefore inhibition of TUCAN (Accession NM_014959.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUCAN.

[22110] Tuftelin 1 (TUFT1, Accession NM_020127.1) is another GAM136 target gene, herein designated TARGET GENE. TUFT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUFT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUFT1 BINDING SITE, designated SEQ ID:5698, to the

nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22111] Another function of GAM136 is therefore inhibition of Tuftelin 1 (TUFT1, Accession NM_020127.1), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUFT1.

[22112] The function of TUFT1 has been established by previous studies. Tuftelin is an acidic protein found in developing and mature extracellular enamel, the unique and highly mineralized ectodermal tissue covering vertebrate teeth (Deutsch, 1989; Deutsch et al., 1991). It is thought to play a major role in mineralization and structural organization of enamel. By fluorescence in situ hybridization, Deutsch et al. (1994) mapped the TUFT1 gene to 1q21- q31. They raised the possibility that an autosomal dominant form of amelogenesis imperfecta (104500, 104530) is due to a mutation in this gene. By FISH, Bashir et al. (1998) localized the TUFT1 gene to 1q21.

[22113]

[22114] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[22115] Deutsch, D.; Palmon, A.; Fisher, L. W.; Kolodny, N.; Termine, J. D.; Young, M. F. : Sequencing of bovine enamelin (tuftelin), a novel acidic enamel protein. J. Biol. Chem. 266: 16021- 16028, 1991. ; and

[22116] Deutsch, D.; Palmon, A.; Young, M. F.; Selig, S.; Kearns, W. G.; Fisher, L. W. : Mapping of the human tuftelin (TUFT1) gene to chromosome 1 by fluorescence in situ hybridization. (Abstrac.

[22117] Further studies establishing the function and utilities of TUFT1 are found in John Hopkins OMIM database record ID 600087, and in cited publications listed in Table 5, which are hereby incorporated by reference.Thioredoxin-like 2 (TXNL2, Accession NM_006541.1) is another GAM136 target gene, herein designated TARGET GENE. TXNL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TXNL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TXNL2 BINDING SITE, designated SEQ ID:3614, to the nucleotide sequence of GAM136 RNA,

herein designated GAM RNA, also designated SEQ ID:279.

[22118] Another function of GAM136 is therefore inhibition of Thioredoxin-like 2 (TXNL2, Accession NM_006541.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXNL2.

[22119] UBF-fl (Accession NM_032828.1) is another GAM136 target gene, herein designated TARGET GENE. UBF-fl BINDING SITE1 and UBF-fl BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by UBF-fl, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBF-fl BINDING SITE1 and UBF-fl BINDING SITE2, designated SEQ ID:3774 and SEQ ID:9865 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22120] Another function of GAM136 is therefore inhibition of UBF-fl (Accession NM_032828.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBF-fl.

[22121] Vent-like homeobox 2 (VENTX2, Accession NM_014468.1) is another GAM136 target gene, herein designated TAR-

GET GENE. VENTX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VENTX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VENTX2 BINDING SITE, designated SEQ ID:1323, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22122] Another function of GAM136 is therefore inhibition of Vent-like homeobox 2 (VENTX2, Accession NM_014468.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VENTX2.

[22123] Vacuolar protein sorting 33a (yeast) (VPS33A, Accession NM_022916.2) is another GAM136 target gene, herein designated TARGET GENE. VPS33A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VPS33A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS33A BINDING SITE, designated SEQ ID:6708, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:279.

[22124] Another function of GAM136 is therefore inhibition of Vacuolar protein sorting 33a (yeast) (VPS33A, Accession NM_022916.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS33A.

[22125] Williams beuren syndrome chromosome region 20a (WBSCR20A, Accession NM_148956.1) is another GAM136 target gene, herein designated TARGET GENE. WBSCR20A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by WBSCR20A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR20A BINDING SITE, designated SEQ ID:18847, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22126] Another function of GAM136 is therefore inhibition of Williams beuren syndrome chromosome region 20a (WBSCR20A, Accession NM_148956.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

WBSCR20A.

[22127] X-ray repair complementing defective repair in chinese hamster cells 2 (XRCC2, Accession NM_005431.1) is another GAM136 target gene, herein designated TARGET GENE. XRCC2 BINDING SITE1 and XRCC2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by XRCC2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XRCC2 BINDING SITE1 and XRCC2 BINDING SITE2, designated SEQ ID:12449 and SEQ ID:13590 respectively, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22128] Another function of GAM136 is therefore inhibition of X-ray repair complementing defective repair in chinese hamster cells 2 (XRCC2, Accession NM_005431.1), a gene which involves in the homologous recombination repair (hrr) pathway of double- stranded dna. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC2.

[22129] The function of XRCC2 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.V-yes-1 yamaguchi sarcoma viral oncogene homolog 1 (YES1, Accession NM_005433.2) is another GAM136 target gene, herein designated TARGET GENE. YES1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by YES1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:416, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22130] Another function of GAM136 is therefore inhibition of V-yes-1 yamaguchi sarcoma viral oncogene homolog 1 (YES1, Accession NM_005433.2), a gene which is a putative protein- tyrosine kinase. Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1.

[22131] The function of YES1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Zinc finger protein 133 (clone phz-13)

(ZNF133, Accession NM_003434.2) is another GAM136 target gene, herein designated TARGET GENE. ZNF133 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF133 BINDING SITE, designated SEQ ID:4840, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22132] Another function of GAM136 is therefore inhibition of Zinc finger protein 133 (clone phz-13) (ZNF133, Accession NM_003434.2) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF133.

[22133] Zinc finger protein 221 (ZNF221, Accession NM_013359.1) is another GAM136 target gene, herein designated TARGET GENE. ZNF221 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF221, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF221 BINDING

SITE, designated SEQ ID:13245, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22134] Another function of GAM136 is therefore inhibition of Zinc finger protein 221 (ZNF221, Accession NM_013359.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF221.

[22135] Zinc finger protein 264 (ZNF264, Accession NM_003417.1) is another GAM136 target gene, herein designated TARGET GENE. ZNF264 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF264, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:4725, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22136] Another function of GAM136 is therefore inhibition of Zinc finger protein 264 (ZNF264, Accession NM_003417.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ZNF264.

[22137] Zinc finger protein 338 (ZNF338, Accession) is another GAM136 target gene, herein designated TARGET GENE. ZNF338 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF338, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF338 BINDING SITE, designated SEQ ID:4054, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22138] Another function of GAM136 is therefore inhibition of Zinc finger protein 338 (ZNF338, Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF338.

[22139] Zinc finger protein 339 (ZNF339, Accession NM_021220.1) is another GAM136 target gene, herein designated TARGET GENE. ZNF339 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF339, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of ZNF339 BINDING SITE, designated SEQ ID:11496, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22140] Another function of GAM136 is therefore inhibition of Zinc finger protein 339 (ZNF339, Accession NM_021220.1) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF339.

[22141] ZTL1 (Accession) is another GAM136 target gene, herein designated TARGET GENE. ZTL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZTL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZTL1 BINDING SITE, designated SEQ ID:20007, to the nucleotide sequence of GAM136 RNA, herein designated GAM RNA, also designated SEQ ID:279.

[22142] Another function of GAM136 is therefore inhibition of ZTL1 (Accession) . Accordingly, utilities of GAM136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZTL1.

[22143]

[22144] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 137 (GAM137), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22145] GAM137 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM137 was detected is described hereinabove with reference to Figs. 8-15.

[22146] GAM137 gene, herein designated GAM GENE, and GAM137 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[22147] GAM137 gene encodes a GAM137 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM137 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM137 precursor RNA is designated SEQ ID:76, and is provided hereinbelow with reference to the sequence listing part.

[22148] GAM137 precursor RNA folds onto itself, forming GAM137

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22149] GAM137 precursor RNA folds onto itself, forming GAM137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[22150] Nucleotide sequence of GAM137 precursor RNA, designated SEQ-ID: 76, and a schematic representation of a predicted secondary folding of GAM137 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[22151] An enzyme complex designated DICER COMPLEX, `dices`

the GAM137 folded precursor RNA into GAM137 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM137 RNA is designated SEQ ID:202, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[22152] GAM137 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM137 target RNA, herein designated GAM TARGET RNA. GAM137 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22153] GAM137 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM137 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM137

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM137 RNA may have a different number of target binding sites in untranslated regions of a GAM137 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22154] The complementary binding of GAM137 RNA, herein designated GAM RNA, to target binding sites on GAM137 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM137 target RNA into GAM137 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22155] It is appreciated that GAM137 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM137 target genes. The mRNA of each one of this plurality of GAM137 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM137 RNA, herein designated GAM RNA, and which when bound by GAM137 RNA causes inhibition of translation of respective one or more GAM137 target proteins.

[22156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM137 gene, herein designated GAM GENE, on one or more GAM137 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22157] It is appreciated that specific functions and accordingly utilities of GAM137 correlate with, and may be deduced from, the identity of the target genes which GAM137 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22158]

[22159]

[22160] Bobby sox homolog (drosophila) (BBX, Accession NM_020235.2) is a GAM137 target gene, herein designated TARGET GENE. BBX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BBX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BBX BINDING SITE, designated SEQ ID:2775, to the nucleotide sequence of GAM137 RNA, herein designated GAM RNA, also designated SEQ ID:202.

[22161] A function of GAM137 is therefore inhibition of Bobby sox homolog (drosophila) (BBX, Accession NM_020235.2) . Accordingly, utilities of GAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BBX.

[22162] KIAA0323 (Accession XM_032634.1) is another GAM137 target gene, herein designated TARGET GENE. KIAA0323 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:8515, to the nucleotide sequence of GAM137 RNA, herein designated GAM RNA, also designated SEQ ID:202.

[22163] Another function of GAM137 is therefore inhibition of KIAA0323 (Accession XM_032634.1) . Accordingly, utilities of GAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323.

[22164] LOC202347 (Accession XM_117390.1) is another GAM137 target gene, herein designated TARGET GENE. LOC202347 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC202347, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC202347 BINDING SITE, designated SEQ ID:3099, to

the nucleotide sequence of GAM137 RNA, herein designated GAM RNA, also designated SEQ ID:202.

[22165] Another function of GAM137 is therefore inhibition of LOC202347 (Accession XM_117390.1) . Accordingly, utilities of GAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202347.

[22166] Transcription factor 7 (t-cell specific, hmg-box) (TCF7, Accession NM_003202.1) is another GAM137 target gene, herein designated TARGET GENE. TCF7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCF7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:8403, to the nucleotide sequence of GAM137 RNA, herein designated GAM RNA, also designated SEQ ID:202.

[22167] Another function of GAM137 is therefore inhibition of Transcription factor 7 (t-cell specific, hmg-box) (TCF7, Accession NM_003202.1) . Accordingly, utilities of GAM137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7.

[22168]

[22169] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 138 (GAM138), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22170] GAM138 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM138 was detected is described hereinabove with reference to Figs. 8-15.

[22171] GAM138 gene, herein designated GAM GENE, and GAM138 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[22172] GAM138 gene encodes a GAM138 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM138 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM138 precursor RNA is designated SEQ ID:179, and is provided hereinbelow with reference to the sequence listing part.

[22173] GAM138 precursor RNA folds onto itself, forming GAM138

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22174] GAM138 precursor RNA folds onto itself, forming GAM138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[22175] Nucleotide sequence of GAM138 precursor RNA, designated SEQ-ID: 179, and a schematic representation of a predicted secondary folding of GAM138 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[22176] An enzyme complex designated DICER COMPLEX, `dices`

the GAM138 folded precursor RNA into GAM138 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM138 RNA is designated SEQ ID:222, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[22177] GAM138 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM138 target RNA, herein designated GAM TARGET RNA. GAM138 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22178] GAM138 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM138 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM138

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM138 RNA may have a different number of target binding sites in untranslated regions of a GAM138 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22179] The complementary binding of GAM138 RNA, herein designated GAM RNA, to target binding sites on GAM138 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM138 target RNA into GAM138 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22180] It is appreciated that GAM138 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM138 target genes. The mRNA of each one of this plurality of GAM138 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM138 RNA, herein designated GAM RNA, and which when bound by GAM138 RNA causes inhibition of translation of respective one or more GAM138 target proteins.

[22181] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM138 gene, herein designated GAM GENE, on one or more GAM138 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22182] It is appreciated that specific functions and accordingly utilities of GAM138 correlate with, and may be deduced from, the identity of the target genes which GAM138 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22183]

[22184]

[22185] Chromosome 6 open reading frame 33 (C6orf33, Accession NM_133367.1) is a GAM138 target gene, herein designated TARGET GENE. C6orf33 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:8900, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22186] A function of GAM138 is therefore inhibition of Chromosome 6 open reading frame 33 (C6orf33, Accession NM_133367.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with C6orf33.

[22187] Chromosome 9 open reading frame 9 (C9orf9, Accession NM_018956.2) is another GAM138 target gene, herein designated TARGET GENE. C9orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C9orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:5771, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22188] Another function of GAM138 is therefore inhibition of Chromosome 9 open reading frame 9 (C9orf9, Accession NM_018956.2) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9.

[22189] FLJ12973 (Accession NM_024908.1) is another GAM138 target gene, herein designated TARGET GENE. FLJ12973 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ12973 BINDING SITE, designated SEQ ID:10308, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22190] Another function of GAM138 is therefore inhibition of FLJ12973 (Accession NM_024908.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12973.

[22191] FLJ20136 (Accession NM_017684.1) is another GAM138 target gene, herein designated TARGET GENE. FLJ20136 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:650, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22192] Another function of GAM138 is therefore inhibition of FLJ20136 (Accession NM_017684.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136.

[22193] FLJ20147 (Accession NM_017687.1) is another GAM138 target gene, herein designated TARGET GENE. FLJ20147 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20147 BINDING SITE, designated SEQ ID:6891, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22194] Another function of GAM138 is therefore inhibition of FLJ20147 (Accession NM_017687.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20147.

[22195] FLJ20700 (Accession NM_017932.1) is another GAM138 target gene, herein designated TARGET GENE. FLJ20700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20700 BINDING SITE, designated SEQ ID:8502, to the

nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22196] Another function of GAM138 is therefore inhibition of FLJ20700 (Accession NM_017932.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20700.

[22197] FLJ20729 (Accession NM_017953.2) is another GAM138 target gene, herein designated TARGET GENE. FLJ20729 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20729, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20729 BINDING SITE, designated SEQ ID:11088, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22198] Another function of GAM138 is therefore inhibition of FLJ20729 (Accession NM_017953.2) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20729.

[22199] FLJ32865 (Accession NM_144613.1) is another GAM138

target gene, herein designated TARGET GENE. FLJ32865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:13561, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22200] Another function of GAM138 is therefore inhibition of FLJ32865 (Accession NM_144613.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865.

[22201] KIAA0475 (Accession XM_301133.1) is another GAM138 target gene, herein designated TARGET GENE. KIAA0475 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:14834, to the nucleotide sequence of GAM138 RNA, herein designated

GAM RNA, also designated SEQ ID:222.

[22202] Another function of GAM138 is therefore inhibition of KIAA0475 (Accession XM_301133.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475.

[22203] KIAA1257 (Accession XM_031577.3) is another GAM138 target gene, herein designated TARGET GENE. KIAA1257 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:18365, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22204] Another function of GAM138 is therefore inhibition of KIAA1257 (Accession XM_031577.3) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257.

[22205] KIAA1443 (Accession NM_020834.1) is another GAM138 target gene, herein designated TARGET GENE. KIAA1443

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1443 BINDING SITE, designated SEQ ID:17528, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22206] Another function of GAM138 is therefore inhibition of KIAA1443 (Accession NM_020834.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1443.

[22207] KIAA1668 (Accession) is another GAM138 target gene, herein designated TARGET GENE. KIAA1668 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1668, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1668 BINDING SITE, designated SEQ ID:19546, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22208] Another function of GAM138 is therefore inhibition of KIAA1668 (Accession) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1668.

[22209] Kelch-like 3 (drosophila) (KLHL3, Accession NM_017415.1) is another GAM138 target gene, herein designated TARGET GENE. KLHL3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KLHL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:18573, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22210] Another function of GAM138 is therefore inhibition of Kelch-like 3 (drosophila) (KLHL3, Accession NM_017415.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3.

[22211] LNK (Accession NM_005475.1) is another GAM138 target gene, herein designated TARGET GENE. LNK BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by LNK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:18117, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22212] Another function of GAM138 is therefore inhibition of LNK (Accession NM_005475.1), a gene which links T- cell receptor activation signal to phospholipase c- gamma- 1, grb- 2 and phosphatidylinositol 3- kinase (by similarity). Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK.

[22213] The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.LOC135818 (Accession XM_059804.4) is another GAM138 target gene, herein designated TARGET GENE. LOC135818 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135818, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135818 BINDING SITE, designated SEQ ID:3223, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22214] Another function of GAM138 is therefore inhibition of LOC135818 (Accession XM_059804.4) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818.

[22215] LOC142927 (Accession) is another GAM138 target gene, herein designated TARGET GENE. LOC142927 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC142927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC142927 BINDING SITE, designated SEQ ID:13504, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22216] Another function of GAM138 is therefore inhibition of LOC142927 (Accession) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LOC142927.

[22217] LOC146229 (Accession XM_085387.1) is another GAM138 target gene, herein designated TARGET GENE. LOC146229 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146229, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:9210, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22218] Another function of GAM138 is therefore inhibition of LOC146229 (Accession XM_085387.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229.

[22219] LOC150147 (Accession) is another GAM138 target gene, herein designated TARGET GENE. LOC150147 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC150147 BINDING SITE, designated SEQ ID:18674, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22220] Another function of GAM138 is therefore inhibition of LOC150147 (Accession) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150147.

[22221] LOC152220 (Accession) is another GAM138 target gene, herein designated TARGET GENE. LOC152220 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:12911, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22222] Another function of GAM138 is therefore inhibition of LOC152220 (Accession) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152220.

[22223] LOC154877 (Accession XM_098626.4) is another GAM138 target gene, herein designated TARGET GENE. LOC154877 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:8021, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22224] Another function of GAM138 is therefore inhibition of LOC154877 (Accession XM_098626.4) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877.

[22225] LOC196529 (Accession) is another GAM138 target gene, herein designated TARGET GENE. LOC196529 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC196529 BINDING SITE, designated SEQ ID:5335, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22226] Another function of GAM138 is therefore inhibition of LOC196529 (Accession) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196529.

[22227] LOC204804 (Accession) is another GAM138 target gene, herein designated TARGET GENE. LOC204804 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC204804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC204804 BINDING SITE, designated SEQ ID:2980, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22228] Another function of GAM138 is therefore inhibition of LOC204804 (Accession) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204804.

[22229] LOC89932 (Accession) is another GAM138 target gene, herein designated TARGET GENE. LOC89932 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC89932, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:19547, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22230] Another function of GAM138 is therefore inhibition of LOC89932 (Accession) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932.

[22231] LOC91250 (Accession XM_037135.1) is another GAM138 target gene, herein designated TARGET GENE. LOC91250 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91250, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, designated SEQ ID:14884, to the nucleotide sequence of GAM138 RNA, herein designated

GAM RNA, also designated SEQ ID:222.

[22232] Another function of GAM138 is therefore inhibition of LOC91250 (Accession XM_037135.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250.

[22233] LOC91549 (Accession XM_039115.8) is another GAM138 target gene, herein designated TARGET GENE. LOC91549 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91549, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91549 BINDING SITE, designated SEQ ID:3224, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22234] Another function of GAM138 is therefore inhibition of LOC91549 (Accession XM_039115.8) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91549.

[22235] LOC93349 (Accession NM_138402.2) is another GAM138 target gene, herein designated TARGET GENE. LOC93349

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93349, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93349 BINDING SITE, designated SEQ ID:10297, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22236] Another function of GAM138 is therefore inhibition of LOC93349 (Accession NM_138402.2) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93349.

[22237] MGC13204 (Accession NM_031465.1) is another GAM138 target gene, herein designated TARGET GENE. MGC13204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13204 BINDING SITE, designated SEQ ID:4720, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22238] Another function of GAM138 is therefore inhibition of MGC13204 (Accession NM_031465.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13204.

[22239] MGC2477 (Accession NM_024099.1) is another GAM138 target gene, herein designated TARGET GENE. MGC2477 BINDING SITE1 and MGC2477 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MGC2477, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2477 BINDING SITE1 and MGC2477 BINDING SITE2, designated SEQ ID:12814 and SEQ ID:13562 respectively, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22240] Another function of GAM138 is therefore inhibition of MGC2477 (Accession NM_024099.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2477.

[22241] Makorin, ring finger protein, 4 (MKRN4, Accession

NM_030757.1) is another GAM138 target gene, herein designated TARGET GENE. MKRN4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MKRN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MKRN4 BINDING SITE, designated SEQ ID:6362, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22242] Another function of GAM138 is therefore inhibition of Makorin, ring finger protein, 4 (MKRN4, Accession NM_030757.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN4.

[22243] Mitochondrial ribosomal protein l49 (MRPL49, Accession NM_004927.2) is another GAM138 target gene, herein designated TARGET GENE. MRPL49 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPL49, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL49 BINDING SITE, designated SEQ ID:12809, to the nucleotide se-

quence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22244] Another function of GAM138 is therefore inhibition of Mitochondrial ribosomal protein l49 (MRPL49, Accession NM_004927.2) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL49.

[22245] Phosphoinositide-3-kinase, catalytic, delta polypeptide (PIK3CD, Accession NM_005026.2) is another GAM138 target gene, herein designated TARGET GENE. PIK3CD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIK3CD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIK3CD BINDING SITE, designated SEQ ID:5480, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22246] Another function of GAM138 is therefore inhibition of Phosphoinositide-3-kinase, catalytic, delta polypeptide (PIK3CD, Accession NM_005026.2), a gene which regulating cell growth. Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PIK3CD.

[22247] The function of PIK3CD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Protein kinase, lysine deficient 3 (PRKWNK3, Accession NM_020922.1) is another GAM138 target gene, herein designated TARGET GENE. PRKWNK3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKWNK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKWNK3 BINDING SITE, designated SEQ ID:3228, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22248] Another function of GAM138 is therefore inhibition of Protein kinase, lysine deficient 3 (PRKWNK3, Accession NM_020922.1) . Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK3.

[22249] RPP30 (Accession NM_006413.2) is another GAM138 target gene, herein designated TARGET GENE. RPP30 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by RPP30, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE, designated SEQ ID:1813, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22250] Another function of GAM138 is therefore inhibition of RPP30 (Accession NM_006413.2), a gene which is a component of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30.

[22251] The function of RPP30 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Solute carrier family 24 (sodium/potassium/calcium exchanger), member 1 (SLC24A1, Accession NM_004727.1) is another GAM138 target gene, herein designated TARGET GENE. SLC24A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC24A1, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC24A1 BINDING SITE, designated SEQ ID:14930, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22252] Another function of GAM138 is therefore inhibition of Solute carrier family 24 (sodium/potassium/calcium exchanger), member 1 (SLC24A1, Accession NM_004727.1), a gene which is a critical component of the visual transduction cascade, controlling the calcium concentration of outer segments during light and darkness. Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC24A1.

[22253] The function of SLC24A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.Thromboxane a2 receptor (TBXA2R, Accession NM_001060.2) is another GAM138 target gene, herein designated TARGET GENE. TBXA2R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBXA2R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:15791, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22254] Another function of GAM138 is therefore inhibition of Thromboxane a2 receptor (TBXA2R, Accession NM_001060.2), a gene which activates Ca2+- activated chloride channels; stimulates platelet aggregation and smooth muscle constriction and therefore may be associated with Bleeding disorder. Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of Bleeding disorder, and of other diseases and clinical conditions associated with TBXA2R.

[22255] The function of TBXA2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Tuftelin 1 (TUFT1, Accession NM_020127.1) is another GAM138 target gene, herein designated TARGET GENE. TUFT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUFT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUFT1 BINDING SITE, designated SEQ ID:18146, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22256] Another function of GAM138 is therefore inhibition of Tuftelin 1 (TUFT1, Accession NM_020127.1), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUFT1.

[22257] The function of TUFT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1) is another GAM138 target gene, herein designated TARGET GENE. WHSC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WHSC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:13027, to the nucleotide sequence of GAM138 RNA, herein designated GAM RNA, also designated SEQ ID:222.

[22258] Another function of GAM138 is therefore inhibition of Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1), a gene which binds covalently to and repairs g/t mismatches. and therefore may be associated with Wolf- hirschhorn syndrome. Accordingly, utilities of GAM138 include diagnosis, prevention and treatment of Wolf- hirschhorn syndrome, and of other diseases and clinical conditions associated with WHSC1.

[22259] The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.

[22260] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 139 (GAM139), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22261] GAM139 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM139 was detected is described hereinabove with reference to Figs. 8-15.

[22262] GAM139 gene, herein designated GAM GENE, and GAM139 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[22263] GAM139 gene encodes a GAM139 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM139 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM139 precursor RNA is designated SEQ ID:31, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:31 is located at position 93064885 relative to chromosome 11.

[22264] GAM139 precursor RNA folds onto itself, forming GAM139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[22265] GAM139 precursor RNA folds onto itself, forming GAM139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[22266] Nucleotide sequence of GAM139 precursor RNA, designated SEQ-ID: 31, and a schematic representation of a predicted secondary folding of GAM139 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[22267] An enzyme complex designated DICER COMPLEX, `dices` the GAM139 folded precursor RNA into GAM139 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy

Group: B) nucleotide sequence of GAM139 RNA is designated SEQ ID:327, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[22268] GAM139 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM139 target RNA, herein designated GAM TARGET RNA. GAM139 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22269] GAM139 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM139 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM139 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limit-

ing GAM139 RNA may have a different number of target binding sites in untranslated regions of a GAM139 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22270] The complementary binding of GAM139 RNA, herein designated GAM RNA, to target binding sites on GAM139 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM139 target RNA into GAM139 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22271] It is appreciated that GAM139 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM139 target genes. The mRNA of each one of this plurality of GAM139 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM139 RNA, herein designated GAM RNA, and which when bound by GAM139 RNA causes inhibition of translation of respective one or more GAM139 target proteins.

[22272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM139 gene, herein designated GAM GENE, on one or more GAM139 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22273] It is appreciated that specific functions and accordingly utilities of GAM139 correlate with, and may be deduced from, the identity of the target genes which GAM139 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22274]

[22275]

[22276] Abhydrolase domain containing 1 (ABHD1, Accession NP_690609.1) is a GAM139 target gene, herein designated TARGET GENE. ABHD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABHD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABHD1 BINDING SITE, designated SEQ ID:18435, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22277] A function of GAM139 is therefore inhibition of Abhydrolase domain containing 1 (ABHD1, Accession NP_690609.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABHD1.

[22278] Adenosine a2a receptor (ADORA2A, Accession NP_000666.2) is another GAM139 target gene, herein designated TARGET GENE. ADORA2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADORA2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of ADORA2A BINDING SITE, designated SEQ ID:13460, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22279] Another function of GAM139 is therefore inhibition of Adenosine a2a receptor (ADORA2A, Accession NP_000666.2), a gene which regulates phagocytosis, apoptosis and platelet aggregation. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADORA2A.

[22280] The function of ADORA2A has been established by previous studies. Adenosine is released from metabolically active cells by facilitated diffusion and is generated extracellularly by degradation of released ATP. Ledent et al. (1997) noted that it is a potent biologic mediator that modulates the activity of numerous cell types, including various neuronal populations, platelets, neutrophils and mast cells, and smooth muscle cells in bronchi and vasculature. Most of these effects help to protect cells and tissues during stress situations such as ischemia. Adenosine mediates its effects through 4 receptor subtypes: the A1 (ADORA1; 102775), A2a (also called RDC8), A2b

(ADORA2B; 600446), and A3 (ADORA3; 600445) receptors. The A2a receptor is abundant in basal ganglia, vasculature and platelets, and stimulates adenylyl cyclase. It is a major target of caffeine. . Libert et al. (1991) and Szepetowski et al. (1993) were clearly mapping the same locus since they used the same RDC8 probe. Although the probe used by MacCollin et al. (1994) was reportedly very similar in sequence, it must in fact have come from a different locus (Gusella, 1994; Gaudray, 1994).

[22281] Animal model experiments lend further support to the function of ADORA2A. By homologous recombination, Ledent et al. (1997) disrupted the Adora2a gene in embryonic stem cells of mice and bred homozygous Adora2a- deficient mice.

[22282] It is appreciated that the abovementioned animal model for ADORA2A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22283] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22286] Further studies establishing the function and utilities of ADORA2A are found in John Hopkins OMIM database record ID 102776, and in cited publications listed in Table 5, which are hereby incorporated by reference.Aldehyde dehydrogenase 5 family, member a1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NP_001071.1) is another GAM139 target gene, herein designated TARGET GENE. ALDH5A1 BINDING SITE1 and ALDH5A1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ALDH5A1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALDH5A1 BINDING SITE1 and ALDH5A1 BINDING SITE2, designated SEQ

ID:8267 and SEQ ID:5625 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22287] Another function of GAM139 is therefore inhibition of Aldehyde dehydrogenase 5 family, member a1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NP_001071.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH5A1.

[22288] Aldehyde dehydrogenase 5 family, member a1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NP_001071.1) is another GAM139 target gene, herein designated TARGET GENE. ALDH5A1 BINDING SITE1 and ALDH5A1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ALDH5A1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALDH5A1 BINDING SITE1 and ALDH5A1 BINDING SITE2, designated SEQ ID:5625 and SEQ ID:8267 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22289] Another function of GAM139 is therefore inhibition of Aldehyde dehydrogenase 5 family, member a1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NP_001071.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH5A1.

[22290] Annexin a9 (ANXA9, Accession NP_003559.1) is another GAM139 target gene, herein designated TARGET GENE. ANXA9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ANXA9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANXA9 BINDING SITE, designated SEQ ID:17446, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22291] Another function of GAM139 is therefore inhibition of Annexin a9 (ANXA9, Accession NP_003559.1), a gene which aggregates and cooperatively binds anionic phospholipids and extracellular matrix proteins. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANXA9.

[22292] The function of ANXA9 has been established by previous

studies. See 602572. Members of the annexin family contain 4 internal repeat domains, each of which includes a type II calcium- binding site. The calcium- binding sites are required for annexins to aggregate and cooperatively bind anionic phospholipids and extracellular matrix proteins. The tetrad core appears to form a calcium ion channel. By searching an EST database for novel annexins, Morgan and Fernandez (1998) identified cDNAs encoding annexin A9, which they called annexin 31. Sequence analysis revealed that the predicted 338- amino acid protein shares less than 40% sequence identity with other annexins. All 4 type II calcium- binding sites in annexin 31 contained amino acid substitutions that ablated their function. However, structural analysis suggested that the conserved putative ion channel was intact. Morgan and Fernandez (1998) proposed that annexin 31 represents a new subfamily of annexins in which the putative internal ion channel is dissociated from the external type II calcium- binding sites. By fluorescence in situ hybridization, Morgan et al. (1999) mapped the ANXA9 gene to chromosome 1q21.

[22293]

[22294] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[22295] Morgan, R. O.; Bell, D. W.; Testa, J. R.; Fernandez, M.- P. : Human annexin 31 genetic mapping and origin. Gene 227: 33- 38, 1999. ; and

[22296] Morgan, R. O.; Fernandez, M.- P. : Expression profile and structural divergence of novel human annexin 31. FEBS Lett. 434: 300- 304, 1998.

[22297] Further studies establishing the function and utilities of ANXA9 are found in John Hopkins OMIM database record ID 603319, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Adaptor-related protein complex 3, mu 1 subunit (AP3M1, Accession NP_036227.1) is another GAM139 tar-get gene, herein designated TARGET GENE. AP3M1 BIND-ING SITE is a target binding site found in the 3` untrans-lated region of mRNA encoded by AP3M1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP3M1 BINDING SITE, designated SEQ ID:2765, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22298] Another function of GAM139 is therefore inhibition of Adaptor-related protein complex 3, mu 1 subunit (AP3M1, Accession NP_036227.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M1.

[22299] Adp-ribosylation factor gtpase activating protein 3 (ARFGAP3, Accession NP_055385.2) is another GAM139 target gene, herein designated TARGET GENE. ARFGAP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ARFGAP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARFGAP3 BINDING SITE, designated SEQ ID:917, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22300] Another function of GAM139 is therefore inhibition of Adp-ribosylation factor gtpase activating protein 3 (ARFGAP3, Accession NP_055385.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFGAP3.

[22301] Rho gtpase activating protein 1 (ARHGAP1, Accession

NP_004299.1) is another GAM139 target gene, herein designated TARGET GENE. ARHGAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGAP1 BINDING SITE, designated SEQ ID:18225, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22302] Another function of GAM139 is therefore inhibition of Rho gtpase activating protein 1 (ARHGAP1, Accession NP_004299.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP1.

[22303] Rho gdp dissociation inhibitor (gdi) alpha (ARHGDIA, Accession NP_004300.1) is another GAM139 target gene, herein designated TARGET GENE. ARHGDIA BINDING SITE1 and ARHGDIA BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ARHGDIA, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of ARHGDIA BINDING SITE1 and ARHGDIA BINDING SITE2, designated SEQ ID:15005 and SEQ ID:15152 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22304] Another function of GAM139 is therefore inhibition of Rho gdp dissociation inhibitor (gdi) alpha (ARHGDIA, Accession NP_004300.1), a gene which is a small guanine nucleotide exchange (GTP/GDP) factor. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGDIA.

[22305] The function of ARHGDIA has been established by previous studies. Ras- related homologs (ARHs), also called Rho genes, belong to the RAS gene superfamily encoding small guanine nucleotide exchange (GTP/GDP) factors. The ARH proteins may be kept in the inactive, GDP-bound state by interaction with GDP dissociation inhibitors (GDIAs). By screening a transformed amnion cell library with an ARHGDIB (OMIM Ref. No. 602843) cDNA, Leffers et al. (1993) isolated cDNAs encoding ARHGDIA. They found that ARHGDIA corresponded to a protein in the keratinocyte 2- dimensional- gel protein database known as IEF (isoelectric focusing) 8118. By 2- dimen-

sional gel electrophoresis, the predicted 204- amino acid protein had a pI of 4.74 and migrated at 29 kD. The amino acid sequences of human and bovine ARHGDIA are 97% identical. Leffers et al. (1993) found that the ARHG-DIA gene contains 6 exons. Northern blot analysis revealed that ARHGDIA was expressed in all cell lines and tissues tested. Overexpression of ARHGDIB in mammalian cells caused them to 'round up' and disrupted the actin cytoskeleton, mimicking the phenotypic changes associated with inactivation of Rho proteins. Wagner et al. (1997) demonstrated by fluorescence in situ hybridization that the GDIA1 gene maps to 17q25.3. The assignment was confirmed by the use of a new somatic cell hybrid panel for 17q.

[22306]

[22307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22308] Leffers, H.; Nielsen, M. S.; Andersen, A. H.; Honore, B.; Madsen, P.; Vandekerckhove, J.; Celis, J. E. : Identification of two human rho GDP dissociation inhibitor proteins whose overexpression leads to disruption of the actin cytoskeleton. Exp. Cell Res. 209: 165- 174, 1993. ; and

[22309] Wagner, T.; Tommerup, N.; Wirth, J.; Leffers, H.; Zimmer, J.; Back, E.; Weissenbach, J.; Scherer, G. : A somatic cell hybrid panel for distal 17q: GDIA1 maps to 17q25.3. Cytogenet. Cell.

[22310] Further studies establishing the function and utilities of ARHGDIA are found in John Hopkins OMIM database record ID 601925, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rho gdp dissociation inhibitor (gdi) gamma (ARHGDIG, Accession NP_001167.1) is another GAM139 target gene, herein designated TARGET GENE. ARHGDIG BINDING SITE1 and ARHGDIG BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ARHGDIG, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGDIG BINDING SITE1 and ARHGDIG BINDING SITE2, designated SEQ ID:6996 and SEQ ID:10749 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22311] Another function of GAM139 is therefore inhibition of Rho gdp dissociation inhibitor (gdi) gamma (ARHGDIG, Accession NP_001167.1) . Accordingly, utilities of GAM139 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGDIG.

[22312] Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_127462.1) is another GAM139 target gene, herein designated TARGET GENE. ARHGEF4 BINDING SITE1 and ARHGEF4 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ARHGEF4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF4 BINDING SITE1 and ARHGEF4 BINDING SITE2, designated SEQ ID:7064 and SEQ ID:2155 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22313] Another function of GAM139 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_127462.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF4.

[22314] Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_056135.2) is another GAM139 target gene, herein designated TARGET GENE. ARHGEF4 BINDING SITE1

and ARHGEF4 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ARHGEF4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF4 BINDING SITE1 and ARHGEF4 BINDING SITE2, designated SEQ ID:7064 and SEQ ID:2155 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22315] Another function of GAM139 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 4 (ARHGEF4, Accession NP_056135.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF4.

[22316] Rho guanine nucleotide exchange factor (gef) 7 (ARHGEF7, Accession NP_663788.1) is another GAM139 target gene, herein designated TARGET GENE. ARHGEF7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ARHGEF7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of ARHGEF7 BINDING SITE, designated SEQ ID:8435, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22317] Another function of GAM139 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 7 (ARHGEF7, Accession NP_663788.1), a gene which acts as a rac1 guanine nucleotide exchange factor (gef) and can induce membrane ruffling. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF7.

[22318] The function of ARHGEF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.ARLTS1 (Accession NP_612459.1) is another GAM139 target gene, herein designated TARGET GENE. ARLTS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARLTS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARLTS1 BINDING SITE, designated SEQ ID:10485, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22319] Another function of GAM139 is therefore inhibition of ARLTS1 (Accession NP_612459.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARLTS1.

[22320] Ankyrin repeat and socs box-containing 1 (ASB1, Accession NP_057198.1) is another GAM139 target gene, herein designated TARGET GENE. ASB1 BINDING SITE1 and ASB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ASB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB1 BINDING SITE1 and ASB1 BINDING SITE2, designated SEQ ID:5956 and SEQ ID:16782 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22321] Another function of GAM139 is therefore inhibition of Ankyrin repeat and socs box-containing 1 (ASB1, Accession NP_057198.1), a gene which May mediate protein-protein interactions. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB1.

[22322] The function of ASB1 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Activating transcription factor 3 (ATF3, Accession NP_004015.2) is another GAM139 target gene, herein designated TARGET GENE. ATF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:16226, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22323] Another function of GAM139 is therefore inhibition of Activating transcription factor 3 (ATF3, Accession NP_004015.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3.

[22324] Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 5 (B4GALT5, Accession NP_004767.1) is another GAM139 target gene, herein designated TARGET GENE. B4GALT5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

B4GALT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:2957, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22325] Another function of GAM139 is therefore inhibition of Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 5 (B4GALT5, Accession NP_004767.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5.

[22326] Beta-site app-cleaving enzyme 2 (BACE2, Accession NP_620477.1) is another GAM139 target gene, herein designated TARGET GENE. BACE2 BINDING SITE1 through BACE2 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE2 BINDING SITE1 through BACE2 BINDING SITE3, designated SEQ ID:16352, SEQ ID:5247 and SEQ ID:4701 respectively, to the nucleotide

sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22327] Another function of GAM139 is therefore inhibition of Beta-site app-cleaving enzyme 2 (BACE2, Accession NP_620477.1), a gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore may be associated with Alzheimer's disease and down syndrome. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Alzheimer's disease and down syndrome, and of other diseases and clinical conditions associated with BACE2.

[22328] The function of BACE2 has been established by previous studies. Deposition in the brain of the 39- to 43- amino acid amyloid- beta peptide is a hallmark of Alzheimer disease (AD; 104300), a frequent complication of Down syndrome (OMIM Ref. No. 190685) patients after age 30 years. Amyloid- beta is generated by proteolytic processing of the amyloid precursor protein (APP; 104760) by beta- and gamma- secretase at the N and C termini, respectively. Presenilin- 1 (OMIM Ref. No. 104311) is involved in the gamma- secretase activity. BACE (OMIM Ref. No. 604252), a transmembrane aspartyl protease, possesses beta- secretase activity. By differential display RT-

PCR of poorly and highly metastatic breast cancer cell lines, followed by screening a bone marrow stroma cell cDNA library, Xin et al. (2000) obtained a cDNA encoding BACE2, which they termed ALP56. Sequence analysis predicted that the 518- amino acid protein has 2 pepsin- like active centers, a signal sequence, a propeptide, and a long C- terminal extension including a transmembrane domain. Northern blot analysis detected 2.5- and 2.0- kb transcripts in metastatic tumors injected in SCID mice (see OMIM Ref. No. 202500). In situ hybridization analysis demonstrated high expression in breast, colon, and prostate cancer biopsies, as well as in normal prostate. Northern blot analysis of normal tissue revealed expression in prostate, pancreas, and placenta. Further exposure detected expression in all tissues tested except brain and lymphocytes. Western blot analysis showed expression of a 60- kD protein as well as apparent autocleavage products of 17 and 14 kD. By searching EST databases with the BACE sequence and identifying mapped sequences, Saunders et al. (1999) identified a cDNA encoding BACE2 and mapped the gene to 21q22.2- q22.3. Using FISH, Acquati et al. (2000) confirmed the localization of BACE2 to 21q22.3, within the Down syndrome critical region.

[22329]

[22330] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22331] Xin, H.; Stephans, J. C.; Duan, X.; Harrowe, G.; Kim, E.; Grieshammer, U.; Kingsley, C.; Giese, K. : Identification of a novel aspartic- like protease differentially expressed in human breast cancer cell lines. Biochim. Biophys. Acta 1501: 125- 137, 2000. ; and

[22332] Saunders, A. J.; Kim, T.- W.; Tanzi, R. E. : BACE maps to chromosome 11 and a BACE homolog, BACE2, reside in the obligate Down syndrome region of chromosome 21. Science 286: 1255A only.

[22333] Further studies establishing the function and utilities of BACE2 are found in John Hopkins OMIM database record ID 605668, and in cited publications listed in Table 5, which are hereby incorporated by reference.Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) is another GAM139 target gene, herein designated TARGET GENE. BAZ2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAZ2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAZ2A BINDING SITE, designated SEQ ID:12267, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22334] Another function of GAM139 is therefore inhibition of Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2A.

[22335] Brain protein i3 (BRI3, Accession NP_056194.1) is another GAM139 target gene, herein designated TARGET GENE. BRI3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BRI3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRI3 BINDING SITE, designated SEQ ID:8333, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22336] Another function of GAM139 is therefore inhibition of Brain protein i3 (BRI3, Accession NP_056194.1) . Accordingly, utilities of GAM139 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with BRI3.

[22337] BRMS1 (Accession NP_056214.1) is another GAM139 target gene, herein designated TARGET GENE. BRMS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BRMS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRMS1 BINDING SITE, designated SEQ ID:10687, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22338] Another function of GAM139 is therefore inhibition of BRMS1 (Accession NP_056214.1), a gene which may be a mediator of metastasis suppression in breast carcinoma (by similarity). and therefore may be associated with Human breast cancer. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Human breast cancer, and of other diseases and clinical conditions associated with BRMS1.

[22339] The function of BRMS1 has been established by previous studies. BRMS1 is a human breast carcinoma metastasis

suppressor gene that maps to 11q13, a hotspot in breast cancer progression. To assess the effect of BRMS1 on breast carcinoma biologic behavior, Seraj et al. (2000) transfected BRMS1 into 2 independently derived metastatic human breast carcinoma cell lines. Stably transfected breast carcinoma cells still formed progressively growing, locally invasive tumors when injected into mammary fat pads, but were significantly less metastatic to lungs and regional lymph nodes.

[22340]

[22341] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22342] Phillips, K. K.; Welch, D. R.; Miele, M. E.; Lee, J. H.; Wei, L. L.; Weissman, B. E. : Suppression of MDA- MB- 435 breast carcinoma cell metastasis following the introduction of human chromosome 11. Cancer Res. 56: 1222- 1227, 1996. ; and

[22343] Seraj, M. J.; Samant, R. S.; Verderame, M. F.; Welch, D. R. : Functional evidence for a novel human breast carcinoma metastasis suppressor, BRMS1, encoded at chromosome 11q13. Cancer Res.

[22344] Further studies establishing the function and utilities of

BRMS1 are found in John Hopkins OMIM database record ID 606259, and in cited publications listed in Table 5, which are hereby incorporated by reference.C14orf107 (Accession NP_061057.1) is another GAM139 target gene, herein designated TARGET GENE. C14orf107 BINDING SITE1 and C14orf107 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C14orf107, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf107 BINDING SITE1 and C14orf107 BINDING SITE2, designated SEQ ID:9620 and SEQ ID:17830 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22345] Another function of GAM139 is therefore inhibition of C14orf107 (Accession NP_061057.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf107.

[22346] Chromosome 14 open reading frame 9 (C14orf9, Accession NP_653169.1) is another GAM139 target gene, herein designated TARGET GENE. C14orf9 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by C14orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf9 BINDING SITE, designated SEQ ID:17946, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22347] Another function of GAM139 is therefore inhibition of Chromosome 14 open reading frame 9 (C14orf9, Accession NP_653169.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf9.

[22348] C15orf16 (Accession NP_570971.1) is another GAM139 target gene, herein designated TARGET GENE. C15orf16 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C15orf16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C15orf16 BINDING SITE, designated SEQ ID:17482, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22349] Another function of GAM139 is therefore inhibition of C15orf16 (Accession NP_570971.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf16.

[22350] C16orf5 (Accession NP_037531.1) is another GAM139 target gene, herein designated TARGET GENE. C16orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C16orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:9004, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22351] Another function of GAM139 is therefore inhibition of C16orf5 (Accession NP_037531.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5.

[22352] Chromosome 20 open reading frame 130 (C20orf130, Accession XP_029741.1) is another GAM139 target gene, herein designated TARGET GENE. C20orf130 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf130, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf130 BINDING SITE, designated SEQ ID:891, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22353] Another function of GAM139 is therefore inhibition of Chromosome 20 open reading frame 130 (C20orf130, Accession XP_029741.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf130.

[22354] Chromosome 20 open reading frame 44 (C20orf44, Accession NP_060714.2) is another GAM139 target gene, herein designated TARGET GENE. C20orf44 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf44, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf44 BINDING SITE, designated SEQ ID:6027, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA,

also designated SEQ ID:327.

[22355] Another function of GAM139 is therefore inhibition of Chromosome 20 open reading frame 44 (C20orf44, Accession NP_060714.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf44.

[22356] Chromosome 22 open reading frame 5 (C22orf5, Accession NP_036396.1) is another GAM139 target gene, herein designated TARGET GENE. C22orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C22orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C22orf5 BINDING SITE, designated SEQ ID:1661, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22357] Another function of GAM139 is therefore inhibition of Chromosome 22 open reading frame 5 (C22orf5, Accession NP_036396.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf5.

[22358] C6orf49 (Accession NP_060071.1) is another GAM139 tar-

get gene, herein designated TARGET GENE. C6orf49 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C6orf49, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf49 BINDING SITE, designated SEQ ID:11971, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22359] Another function of GAM139 is therefore inhibition of C6orf49 (Accession NP_060071.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf49.

[22360] Complement component 8, gamma polypeptide (C8G, Accession NP_000597.1) is another GAM139 target gene, herein designated TARGET GENE. C8G BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C8G, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C8G BINDING SITE, desig-

nated SEQ ID:8475, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22361] Another function of GAM139 is therefore inhibition of Complement component 8, gamma polypeptide (C8G, Accession NP_000597.1), a gene which is one of three components of complement C8, a constitutent of the membrane attack complex. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8G.

[22362] The function of C8G has been established by previous studies. The eighth component of complement (C8) consists of 3 nonidentical subunits arranged asymmetrically as a disulfide- linked alpha- gamma dimer and a noncovalently associated beta chain. Genetic studies of C8 polymorphisms established that alpha- gamma and beta are encoded at different loci (see OMIM Ref. No. 120950, 120960). Implicit in this finding was the existence of 2 different genes and the likelihood that alpha- gamma is synthesized as a single- chain precursor. Ng et al. (1987), however, presented evidence that the C8 molecule is assembled from 3 different gene products, alpha, beta, and gamma, that undergo both covalent and noncovalent as-

sociation to yield the mature protein. The linkage relationships of the gamma locus to the others are unknown. Ng et al. (1987) identified a cDNA clone containing the entire coding region for the human gamma polypeptide, and its sequence supported the existence of a separate gamma mRNA. Whereas the alpha chain and beta chain of C8 show an overall sequence homology to C6, C7, and C9 (which like C8 are involved in the membrane- attack complex that leads to lysis of target cells), the gamma chain was found by Haefliger et al. (1987) to show structural homology to protein HC (alpha- 1- microglobulin/bikunin precursor; AMBP; 176870). This suggested a similar 3- dimensional structure of the 2 proteins and a possible functional relationship. Hunt et al. (1987) also pointed out the close sequence homology of C8G to alpha- 1- microglobulin. The C8G gene and its protein product belong to the lipocalin superfamily, a group of distantly related and similarly folded proteins that are able to carry small lipophilic molecules such as retinol, odorants, and steroids. The lipocalin superfamily has a very ancient origin since lipocalins are found in arthropods as well as in vertebrates.

[22363]

[22364] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22365] Ng, S. C.; Rao, A. G.; Howard, O. M. Z.; Sodetz, J. M. : The eighth component of human complement: evidence that it is an oligomeric serum protein assembled from products of three different genes. Biochemistry 26: 5229- 5233, 1987. ; and

[22366] Hunt, L. T.; Elzanowski, A.; Barker, W. C. : The homology of complement factor C8 gamma chain and alpha- 1- microglobulin. Biochem. Biophys. Res. Commun. 149: 282-288, 1987.

[22367] Further studies establishing the function and utilities of C8G are found in John Hopkins OMIM database record ID 120930, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome 9 open reading frame 14 (C9orf14, Accession XP_098859.2) is another GAM139 target gene, herein designated TARGET GENE. C9orf14 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C9orf14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of C9orf14 BINDING SITE, designated SEQ ID:10704, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22368] Another function of GAM139 is therefore inhibition of Chromosome 9 open reading frame 14 (C9orf14, Accession XP_098859.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf14.

[22369] Carbonic anhydrase xii (CA12, Accession NP_001209.1) is another GAM139 target gene, herein designated TARGET GENE. CA12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CA12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CA12 BINDING SITE, designated SEQ ID:4145, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22370] Another function of GAM139 is therefore inhibition of Carbonic anhydrase xii (CA12, Accession NP_001209.1), a gene which functions in cellular transport and metabolic processes. and therefore may be associated with Cell renal

carcinomas. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Cell renal carcinomas, and of other diseases and clinical conditions associated with CA12.

[22371] The function of CA12 has been established by previous studies. Tureci et al. (1998) cloned the gene identified by Sahin et al. (1995) from the RCC and named it CA XII. The cDNA sequence encodes a deduced 354- amino acid protein with a predicted molecular mass of 39,448 Da and features of a type I membrane protein. The extracellular CA domain shows 30 to 42% similarity with known human CAs, contains all 3 zinc- binding histidine residues found in active CAs, and contains 2 potential sites for asparagine glycosylation. Expression of the CA XII cDNA in mammalian cells produced a 43- to 44- kD doublet; treatment with PNGase (endoglycosidase) F resulted in a single 39-kD product. The recombinant CA XII had appreciable catalytic activity. By Northern blot analysis, the authors detected a 4.5- kb CA XII transcript in normal human kidney, colon, and activated lymphocytes. They found that CA XII is overexpressed in 10% of clear cell renal carcinomas, as compared with the corresponding normal renal tissue. Sequencing revealed no differences between the

RCC- derived cDNA and a CA XII cDNA isolated from normal kidney. Carbonic anhydrases (CAs) are a family of zinc metalloenzymes. For background information on the CA family,

[22372]

[22373] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22374] Tureci, O.; Sahin, U.; Vollmar, E.; Siemer, S.; Gottert, E.; Seitz, G.; Parkkila, A. K.; Shah, G. N.; Grubb, J. H.; Pfreundschuh, M.; Sly, W. S. : Human carbonic anhydrase XII: cDNA cloning, expression, and chromosomal localization of a carbonic anhydrase gene that is overexpressed in some renal cell cancers. Proc. Nat. Acad. Sci. 95: 7608-7613, 1998. ; and

[22375] Sahin, U.; Tureci, O.; Schmitt, H.; Cochlovius, B.; Johannes, T.; Schmits, R.; Stenner, F.; Luo, G.; Schobert, I.; Pfreundschuh, M. : Human neoplasms elicit multiple specific immune resp.

[22376] Further studies establishing the function and utilities of CA12 are found in John Hopkins OMIM database record ID 603263, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calmodulin-like 3

(CALML3, Accession NP_005176.1) is another GAM139 target gene, herein designated TARGET GENE. CALML3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CALML3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CALML3 BINDING SITE, designated SEQ ID:7337, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22377] Another function of GAM139 is therefore inhibition of Calmodulin-like 3 (CALML3, Accession NP_005176.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALML3.

[22378] Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116765.1) is another GAM139 target gene, herein designated TARGET GENE. CASP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE, designated SEQ ID:9375, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22379] Another function of GAM139 is therefore inhibition of Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116765.1), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2.

[22380] The function of CASP2 has been established by previous studies. Lassus et al. (2002) found that cytotoxic stress causes activation of caspase- 2 and that this caspase is required for the permeabilization of mitochondria. Caspase- 2 is required for stress- induced apoptosis and for release of cytochrome c and Smac (OMIM Ref. No. 605219) from mitochondria and for translocation of Bax from the cytoplasm to mitochondria.

[22381] Animal model experiments lend further support to the function of CASP2. To evaluate the requirement for caspase- 2 in various aspects of apoptosis, Bergeron et al.

(1998) generated caspase- 2- deficient mice. Excess numbers of the germ cells were 'endowed' in ovaries of mutant mice, and the oocytes were resistant to cell death following exposure to chemotherapeutic drugs. Apoptosis mediated by granzyme B (OMIM Ref. No. 123910) and perforin (OMIM Ref. No. 170280) was defective in caspase- 2- deficient B lymphoblasts. In contrast, cell death of motor neurons during development was accelerated in caspase- 2- deficient mice. In addition, caspase- 2- deficient sympathetic neurons underwent apoptosis more effectively than wildtype neurons when deprived of nerve growth factor. Thus, caspase- 2 acts as both a positive and a negative cell death effector, depending upon cell lineage and stage of development.

[22382] It is appreciated that the abovementioned animal model for CASP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22383] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22384] Bergeron, L.; Perez, G. I.; Macdonald, G.; Shi, L.; Sun, Y.; Jurisicova, A.; Varmuza, S.; Latham, K. E.; Flaws, J. A.;

[22386] Further studies establishing the function and utilities of CASP2 are found in John Hopkins OMIM database record ID 600639, and in cited publications listed in Table 5, which are hereby incorporated by reference.Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116766.1) is another GAM139 target gene, herein designated TARGET GENE. CASP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE, designated SEQ ID:9375, to the nucleotide sequence of GAM139 RNA, herein designated

GAM RNA, also designated SEQ ID:327.

[22387] Another function of GAM139 is therefore inhibition of Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116766.1), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2.

[22388] The function of CASP2 has been established by previous studies. Lassus et al. (2002) found that cytotoxic stress causes activation of caspase- 2 and that this caspase is required for the permeabilization of mitochondria. Caspase- 2 is required for stress- induced apoptosis and for release of cytochrome c and Smac (OMIM Ref. No. 605219) from mitochondria and for translocation of Bax from the cytoplasm to mitochondria.

[22389] Animal model experiments lend further support to the function of CASP2. To evaluate the requirement for caspase- 2 in various aspects of apoptosis, Bergeron et al. (1998) generated caspase- 2- deficient mice. Excess numbers of the germ cells were 'endowed' in ovaries of mutant mice, and the oocytes were resistant to cell death

following exposure to chemotherapeutic drugs. Apoptosis mediated by granzyme B (OMIM Ref. No. 123910) and perforin (OMIM Ref. No. 170280) was defective in caspase- 2- deficient B lymphoblasts. In contrast, cell death of motor neurons during development was accelerated in caspase- 2- deficient mice. In addition, caspase- 2- deficient sympathetic neurons underwent apoptosis more effectively than wildtype neurons when deprived of nerve growth factor. Thus, caspase- 2 acts as both a positive and a negative cell death effector, depending upon cell lineage and stage of development.

[22390] It is appreciated that the abovementioned animal model for CASP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22391] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22392] Bergeron, L.; Perez, G. I.; Macdonald, G.; Shi, L.; Sun, Y.; Jurisicova, A.; Varmuza, S.; Latham, K. E.; Flaws, J. A.; Salter, J. C. M.; Hara, H.; Moskowitz, M. A.; Li, E.; Greenberg, A.; Tilly, J. L.; Yuan, J. : Defects in regulation of apoptosis in caspase- 2- deficient mice. Genes Dev. 12:

1304- 1314, 1998. ; and

[22393] Lassus, P.; Opitz- Araya, X.; Lazebnik, Y. : Requirement for caspase- 2 in stress- induced apoptosis before mitochondrial permeabilization. Science 297: 1352- 1354, 2002.

[22394] Further studies establishing the function and utilities of CASP2 are found in John Hopkins OMIM database record ID 600639, and in cited publications listed in Table 5, which are hereby incorporated by reference.Core-binding factor, runt domain, alpha subunit 2; translocated to, 1; cyclin d-related (CBFA2T1, Accession NP_783554.1) is another GAM139 target gene, herein designated TARGET GENE. CBFA2T1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CBFA2T1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T1 BINDING SITE, designated SEQ ID:14704, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22395] Another function of GAM139 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2;

translocated to, 1; cyclin d-related (CBFA2T1, Accession NP_783554.1), a gene which produces a chimeric gene made up of the 5- prime region of the AML1 gene fused to the 3- prime region of the ETO gene through translocation. and therefore may be associated with Human leukemia. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Human leukemia., and of other diseases and clinical conditions associated with CBFA2T1.

[22396] The function of CBFA2T1 has been established by previous studies. Wolford and Prochazka (1998) reported that the MTG8 gene contains 13 exons spanning over 87 kb of DNA. They identified cDNAs representing alternatively spliced MTG8 transcripts in which a 155- bp exon (9a) is present. Inclusion of this exon changes the reading frame, resulting in the introduction of a premature stop codon. The encoded truncated proteins lack 177 C- terminal residues, which is the region containing 2 putative zinc finger motifs, the last P/S/T- rich domain, and a putative alpha- helical coiled- coil structure. Northern blot analysis of human tissues detected an approximately 5.5- kb MTG8 transcript in heart, brain, placenta, lung, skeletal muscle, and pancreas but not in liver or kidney. RT- PCR

analysis of a number of human tissues showed highest levels of MTG8 expression in fetal brain, followed by adult brain and heart. Relatively abundant mRNA levels were also found in lung, pituitary, and placenta. When first identified as a partner with AML1 in acute myeloid leukemia (Erickson et al., 1992; Miyoshi et al., 1993), the gene was referred to as MTG8 for 'myeloid translocation gene on 8q22.' Wolford et al. (1998) found that MTG8 mRNAs are expressed at relatively high levels in human adipose tissue. They therefore investigated MTG8 as a candidate gene in obesity, studying the relationship between a highly polymorphic marker in the 3- prime untranslated region of the MTG8 gene and obesity in Pima Indians of Arizona, a population with one of the highest reported rates of obesity. They detected a male- specific association with age- adjusted percentage body fat ($p = 0.0002$), body mass index ($p = 0.01$), waist circumference ($p = 0.008$), and thigh circumference ($p = 0.02$). Comparative analysis of all 13 MTG8 exons in 30 Pimas did not reveal any genetic variants that could explain the association with obesity in males.

[22397]

[22398] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[22399] Wolford, J. K.; Prochazka, M. : Structure and expression of the human MTG8/ETO gene. Gene 212: 103- 109, 1998. ; and

[22401] Further studies establishing the function and utilities of CBFA2T1 are found in John Hopkins OMIM database record ID 133435, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carbonyl reductase 1 (CBR1, Accession NP_001748.1) is another GAM139 target gene, herein designated TARGET GENE. CBR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBR1 BINDING SITE, designated SEQ ID:13028, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22402] Another function of GAM139 is therefore inhibition of Carbonyl reductase 1 (CBR1, Accession NP_001748.1), a gene which catalyze the reduction of a wide variety of carbonyl compounds including the antitumor anthracycline antibiotics. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBR1.

[22403] The function of CBR1 has been established by previous studies. Carbonyl reductase (EC 1.1.1.184) is 1 of several monomeric, NADPH- dependent oxidoreductases having wide specificity for carbonyl compounds that are generally referred to as aldoketoreductases. Others include aldehyde reductase (EC 1.1.1.2; 103830) and aldose reductase (EC 1.1.1.21; 103880). Wermuth et al. (1988) isolated and characterized a cDNA complementary to carbonyl reductase mRNA from a human placenta cDNA library. The cDNA contained an open reading frame encoding a protein comprised of 277 amino acids with a molecular weight of 30,375. Comparison of the predicted protein sequence with the primary structures of other aldoketoreductases showed no significant homologies. A possible homology, on the other hand, was found between carbonyl reductase and 'short' subunit alcohol/polyol dehy-

drogenases. Carbonyl reductase catalyzes the reduction of a great variety of carbonyl compounds, e.g., quinones derived from polycyclic aromatic hydrocarbons, 9- keto- prostaglandins, and the antitumor anthracycline antibiotics daunorubicin and doxorubicin. The enzyme is widely distributed in human tissues and also occurs in other mammalian and nonmammalian species. In a carbonyl reductase cDNA cloned from a breast cancer cell line, Forrest et al. (1990) demonstrated 1,219 basepairs. Southern analysis of genomic DNA digested with several restriction enzymes and analyzed by hybridization with a labeled cDNA probe indicated that carbonyl reductase is probably coded by a single gene and does not belong to a family of structurally similar enzymes. Southern analysis of 17 mouse/human somatic cell hybrids showed that carbonyl reductase is located on chromosome 21. Carbonyl reductase mRNA was induced 3- or 4- fold in 24 hours with BHA, beta- naphthoflavone, or Sudan 1. Avramopoulos et al. (1992) confirmed assignment to chromosome 21 by genetic linkage mapping using a DNA polymorphism from the 3- prime untranslated region of the CBR gene. They demonstrated, furthermore, that the gene lies between that for interferon- alpha receptor (OMIM Ref. No.

107450) and D21S55, being about 3.4 and 7.2 cM, respectively, from the 2 flanking loci. The findings placed CBR in the telomeric band 21q22.3. By high- resolution fluorescence in situ hybridization, Lemieux et al. (1993) mapped the CBR gene to 21q22.12, very close to the SOD1 locus at position 21q22.11. CBR displayed gene dosage effects in trisomy 21 human lymphoblasts at both the DNA and the mRNA levels. With increasing chromosome 21 ploidy, lymphoblasts also showed increased aldo- keto reductase activity and increased quinone reductase activity. Both of these activities have been shown to be associated with carbonyl reductase. The location of CBR near SOD1 and the increased enzyme activity and potential for free radical modulation in trisomy 21 cells implicate CBR as a candidate for contributing to the pathology of Down syndrome.

[22404]

[22405] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22406] Watanabe, K.; Sugawara, C.; Ono, A.; Fukuzumi, Y.; Itakura, S.; Yamazaki, M.; Tashiro, H.; Osoegawa, K.; Soeda, E.; Nomura, T. : Mapping of a novel human car-

bonyl reductase, CBR3, and ribosomal pseudogenes to human chromosome 21q22.2. Genomics 52: 95- 100, 1998. ; and

[22408] Further studies establishing the function and utilities of CBR1 are found in John Hopkins OMIM database record ID 114830, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-c motif) receptor 8 (CCR8, Accession NP_005192.1) is another GAM139 target gene, herein designated TARGET GENE. CCR8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CCR8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR8 BINDING SITE, designated SEQ ID:2636, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22409] Another function of GAM139 is therefore inhibition of Chemokine (c-c motif) receptor 8 (CCR8, Accession

NP_005192.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR8.

[22410] Cd151 antigen (CD151, Accession NP_620599.1) is another GAM139 target gene, herein designated TARGET GENE. CD151 BINDING SITE1 and CD151 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CD151, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD151 BINDING SITE1 and CD151 BINDING SITE2, designated SEQ ID:5033 and SEQ ID:15477 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22411] Another function of GAM139 is therefore inhibition of Cd151 antigen (CD151, Accession NP_620599.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD151.

[22412] Cd151 antigen (CD151, Accession NP_620599.1) is another GAM139 target gene, herein designated TARGET GENE. CD151 BINDING SITE1 and CD151 BINDING SITE2

are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CD151, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD151 BINDING SITE1 and CD151 BINDING SITE2, designated SEQ ID:15477 and SEQ ID:5033 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22413] Another function of GAM139 is therefore inhibition of Cd151 antigen (CD151, Accession NP_620599.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD151.

[22414] Cd1b antigen, b polypeptide (CD1B, Accession NP_001755.1) is another GAM139 target gene, herein designated TARGET GENE. CD1B BINDING SITE1 and CD1B BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CD1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD1B BINDING SITE1 and CD1B BINDING SITE2, designated SEQ

ID:6775 and SEQ ID:9277 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22415] Another function of GAM139 is therefore inhibition of Cd1b antigen, b polypeptide (CD1B, Accession NP_001755.1), a gene which is member B of the CD1 family and involved in antigen presentation. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD1B.

[22416] The function of CD1B has been established by previous studies. CD1B is a group 1 member of the CD1 family of major histocompatibility (MHC)- like glycoproteins. See CD1A (OMIM Ref. No. 188370) for background on CD1 molecules. Beckman et al. (1994) and Sieling et al. (1995) showed that T cells can recognize not only peptide antigens presented by classical MHC molecules, but also virulence- associated mycobacterial lipid antigens such as mycolic acids and lipoarabinomannan (LAM) derivatives, respectively, presented to TCRA (OMIM Ref. No. 186880)/TCRB+ (OMIM Ref. No. 186930) CD4- CD8- T cells by CD1B- bearing antigen- presenting cells (APCs). Sieling et al. (1995) found that LAM recognition requires

internalization and acidification in the endosomal compartment before presentation on the APC surface. Examining dermal leprosy (OMIM Ref. No. 246300) lesions by immunohistochemistry from patients with the tuberculoid form of the disease, associated with high specific cell-mediated immunity (CMI), Sieling et al. (1999) observed strong induction of CD1A, CD1B, and CD1C (OMIM Ref. No. 188340) expression. In contrast, lesions from patients with the lepromatous form, associated with weak or absent M. leprae- specific CMI, do not express CD1 antigens. Moreover, by 2- color immunofluorescence analysis, Sieling et al. (1999) demonstrated that the cells expressing CD1 antigens are CD83+ (OMIM Ref. No. 604534) dendritic cells, which are also highly efficient APCs for CD1B- restricted T cells in vitro. In a review of CD1 lipid antigen presentation, Park and Bendelac (2000) noted that lipid binding might occur in the secretory pathway, at the cell surface, or only after internalization in an acidified compartment. CD1B is located in the late endosome or lysosome. Access to the endocytic pathway is regulated by a tyrosine- based motif in the cytoplasmic tail of CD1 that differs among CD1B, CD1C, and CD1D (OMIM Ref. No. 188410).

[22417]

[22418] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22419] Sieling, P. A.; Jullien, D.; Dahlem, M.; Tedder, T. F.; Rea, T. H.; Modlin, R. L.; Porcelli, S. A. : CD1 expression by dendritic cells in human leprosy lesions: correlation with effective host immunity. J. Immun. 162: 1851- 1858, 1999. ; and

[22420] Park, S.- H.; Bendelac, A. : CD1- restricted T- cell responses and microbial infection. Nature 406: 788- 792, 2000.

[22421] Further studies establishing the function and utilities of CD1B are found in John Hopkins OMIM database record ID 188360, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd79a antigen (immunoglobulin-associated alpha) (CD79A, Accession NP_067612.1) is another GAM139 target gene, herein designated TARGET GENE. CD79A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD79A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of CD79A BINDING SITE, designated SEQ ID:9511, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22422] Another function of GAM139 is therefore inhibition of Cd79a antigen (immunoglobulin-associated alpha) (CD79A, Accession NP_067612.1), a gene which may ba associated with surface immunoglobulin on B cells and involved in signal transduction. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD79A.

[22423] The function of CD79A has been established by previous studies. The mouse mb1 gene was originally identified on the basis of its restricted expression in lymphocytes of B lineage. Predicted structural homology with the gamma chain of the CD3 complex of T cells (OMIM Ref. No. 186740) led to the suggestion that the MB1 protein may associate with surface immunoglobulin on B cells and be involved in signal transduction. To identify genes specifically expressed in normal human B cells, Ha et al. (1992) constructed a B minus T lymphocyte subtraction library and isolated a cDNA clone highly homologous to murine mb1. The full- length cDNA was found to encode a mem-

brane glycoprotein of 226 amino acids which showed striking homology to the mouse mb1 through much of its structure. The B- cell antigen receptor complex consists of a clonally restricted antigen binding molecule (membrane Ig) associated noncovalently with an 'invariant' transducer/transporter complex, the CD79A/CD79B (alternatively known as Ig- alpha/Ig- beta) heterodimer; see review by Reth (1992). Hashimoto et al. (1994) determined the germline DNA sequence of the human IGA gene by PCR sequencing of a cosmid clone derived from an arrayed human chromosome 19 library. The IGA gene was localized to 19q13.2 in a site within the CEA (OMIM Ref. No. 114890)- like gene cluster. The initial assignment to chromosome 19 was done by searching a hamster/human somatic cell DNA panel for PCR products of a predicted size. Once the gene was localized to chromosome 19, a 19- enriched cosmid library was screened by Southern blotting with the identification of 6 probe- positive cosmids. These studies, as well as fluorescence in situ hybridization, precisely mapped the gene to 19q13.2. The gene was found to reside on a contig between CGM1, a member of the CEA family, and biliary glycoprotein I (BGP1; 109770), which are separated by less than 600 kb.

Like the mouse counterpart, the human IGA gene has 5 exons interrupted by 4 introns

[22424]

[22425] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22426] Ha, H.; Kubagawa, H.; Burrows, P. D. : Molecular cloning and expression pattern of a human gene homologous to the murine mb- 1 gene. J. Immun. 148: 1526- 1531, 1992. ; and

[22427] Hashimoto, S.; Mohrenweiser, H. W.; Gregersen, P. K.; Chiorazzi, N. : Chromosomal localization, genomic structure, and allelic polymorphism of the human CD79a (Ig-alpha/mb- 1) gene. Immun.

[22428] Further studies establishing the function and utilities of CD79A are found in John Hopkins OMIM database record ID 112205, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd79a antigen (immunoglobulin-associated alpha) (CD79A, Accession NP_001774.1) is another GAM139 target gene, herein designated TARGET GENE. CD79A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD79A, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD79A BINDING SITE, designated SEQ ID:9511, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22429] Another function of GAM139 is therefore inhibition of Cd79a antigen (immunoglobulin-associated alpha) (CD79A, Accession NP_001774.1), a gene which may ba associated with surface immunoglobulin on B cells and involved in signal transduction. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD79A.

[22430] The function of CD79A has been established by previous studies. The mouse mb1 gene was originally identified on the basis of its restricted expression in lymphocytes of B lineage. Predicted structural homology with the gamma chain of the CD3 complex of T cells (OMIM Ref. No. 186740) led to the suggestion that the MB1 protein may associate with surface immunoglobulin on B cells and be involved in signal transduction. To identify genes specifically expressed in normal human B cells, Ha et al. (1992) constructed a B minus T lymphocyte subtraction library

and isolated a cDNA clone highly homologous to murine mb1. The full- length cDNA was found to encode a membrane glycoprotein of 226 amino acids which showed striking homology to the mouse mb1 through much of its structure. The B- cell antigen receptor complex consists of a clonally restricted antigen binding molecule (membrane Ig) associated noncovalently with an 'invariant' transducer/transporter complex, the CD79A/CD79B (alternatively known as Ig- alpha/Ig- beta) heterodimer; see review by Reth (1992). Hashimoto et al. (1994) determined the germline DNA sequence of the human IGA gene by PCR sequencing of a cosmid clone derived from an arrayed human chromosome 19 library. The IGA gene was localized to 19q13.2 in a site within the CEA (OMIM Ref. No. 114890)- like gene cluster. The initial assignment to chromosome 19 was done by searching a hamster/human somatic cell DNA panel for PCR products of a predicted size. Once the gene was localized to chromosome 19, a 19- enriched cosmid library was screened by Southern blotting with the identification of 6 probe- positive cosmids. These studies, as well as fluorescence in situ hybridization, precisely mapped the gene to 19q13.2. The gene was found to reside on a contig between CGM1, a

member of the CEA family, and biliary glycoprotein I (BGP1; 109770), which are separated by less than 600 kb. Like the mouse counterpart, the human IGA gene has 5 exons interrupted by 4 introns

[22431]

[22432] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22433] Ha, H.; Kubagawa, H.; Burrows, P. D. : Molecular cloning and expression pattern of a human gene homologous to the murine mb- 1 gene. J. Immun. 148: 1526- 1531, 1992. ; and

[22434] Hashimoto, S.; Mohrenweiser, H. W.; Gregersen, P. K.; Chiorazzi, N. : Chromosomal localization, genomic structure, and allelic polymorphism of the human CD79a (Ig-alpha/mb- 1) gene. Immun.

[22435] Further studies establishing the function and utilities of CD79A are found in John Hopkins OMIM database record ID 112205, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd80 antigen (cd28 antigen ligand 1, b7-1 antigen) (CD80, Accession NP_005182.1) is another GAM139 target gene, herein designated TARGET GENE. CD80 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by CD80, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD80 BINDING SITE, designated SEQ ID:14816, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22436] Another function of GAM139 is therefore inhibition of Cd80 antigen (cd28 antigen ligand 1, b7-1 antigen) (CD80, Accession NP_005182.1), a gene which provides regulatory signals for T lymphocytes. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD80.

[22437] The function of CD80 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Cd97 antigen (CD97, Accession NP_510966.1) is another GAM139 target gene, herein designated TARGET GENE. CD97 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD97, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD97 BINDING SITE, designated SEQ ID:830, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22438] Another function of GAM139 is therefore inhibition of Cd97 antigen (CD97, Accession NP_510966.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD97.

[22439] Cd97 antigen (CD97, Accession NP_001775.2) is another GAM139 target gene, herein designated TARGET GENE. CD97 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD97, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD97 BINDING SITE, designated SEQ ID:830, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22440] Another function of GAM139 is therefore inhibition of Cd97 antigen (CD97, Accession NP_001775.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD97.

[22441] Cell division cycle 42 (gtp binding protein, 25kda) (CDC42, Accession NP_001782.1) is another GAM139 target gene, herein designated TARGET GENE. CDC42 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC42, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of CDC42 BINDING SITE, designated SEQ ID:17563, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22442] Another function of GAM139 is therefore inhibition of Cell division cycle 42 (gtp binding protein, 25kda) (CDC42, Accession NP_001782.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42.

[22443] Cadherin 12, type 2 (n-cadherin 2) (CDH12, Accession NP_004052.2) is another GAM139 target gene, herein designated TARGET GENE. CDH12 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CDH12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH12 BINDING SITE, designated SEQ ID:12987, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22444] Another function of GAM139 is therefore inhibition of Cadherin 12, type 2 (n-cadherin 2) (CDH12, Accession NP_004052.2) . Accordingly, utilities of GAM139 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH12.

[22445] Cyclin-dependent kinase inhibitor 1a (p21, cip1) (CDKN1A, Accession NP_510867.1) is another GAM139 target gene, herein designated TARGET GENE. CDKN1A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CDKN1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDKN1A BINDING SITE, designated SEQ ID:10006, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22446] Another function of GAM139 is therefore inhibition of Cyclin-dependent kinase inhibitor 1a (p21, cip1) (CDKN1A, Accession NP_510867.1), a gene which inhibits cyclin- kinase activity and probably serves as the effector of p53 cell cycle control. and therefore may be associated with Lung cancer. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Lung cancer, and of other diseases and clinical conditions associated with CDKN1A.

[22447] The function of CDKN1A has been established by previous studies. The preferred name and symbol for this gene are cyclin- dependent kinase inhibitor- 1A (OMIM Ref. No. CDKN1A). Also referred to as p21 and as CDKN1, this protein inhibits cyclin- kinase activity, is tightly regulated at the transcriptional level by p53, and probably serves as the effector of p53 cell cycle control. The ability of p53 (OMIM Ref. No. 191170) to activate transcription from specific sequences suggests that genes induced by p53 may mediate its biologic role as a tumor suppressor. Using a subtractive hybridization approach, El- Deiry et al. (1993) identified a gene they called WAF1 (for wildtype p53- activated fragment 1), whose induction was associated with wildtype but not mutant p53 gene expression in a human brain tumor cell line. El- Deiry et al. (1993) found that the sequence, structure, and activation by p53 was conserved in rodents. Introduction of WAF1 cDNA suppressed the growth of human brain, lung, and colon tumor cells in culture. Using a yeast enhancer trap, they identified a p53- binding site 2.4 kb upstream of WAF1 coding sequences. The WAF1 promoter, including this p53- binding site, conferred p53- dependent inducibility upon a heterologous reporter gene. After acceptance of

their paper for publication, El- Deiry et al. (1993) learned that Harper et al. (1993) had identified a gene, called CIP1, whose product binds to cyclin complexes and inhibits the function of cyclin- dependent kinases. They found that the sequence of CIP1, described by Harper et al. (1993) in the same issue of Cell, was identical to that of WAF1. The results provided a dramatic example of the interplay between tumor suppressor genes and the cell cycle.

[22448]

[22449] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22450] El- Deiry, W. S.; Tokino, T.; Velculescu, V. E.; Levy, D. B.; Parsons, R.; Trent, J. M.; Lin, D.; Mercer, E.; Kinzler, K. W.; Vogelstein, B. : WAF1, a potential mediator of p53 tumor suppression. Cell 75: 817- 825, 1993. ; and

[22451] Harper, J. W.; Adami, G. R.; Wei, N.; Keyomarsi, K.; Elledge, S. J. : The p21 Cdk- interacting protein Cip1 is a potent inhibitor of G1 cyclin- dependent kinases. Cell 75: 805-816, 1993.

[22452] Further studies establishing the function and utilities of CDKN1A are found in John Hopkins OMIM database record

ID 116899, and in cited publications listed in Table 5, which are hereby incorporated by reference.CDW92 (Accession NP_536856.2) is another GAM139 target gene, herein designated TARGET GENE. CDW92 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDW92, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDW92 BINDING SITE, designated SEQ ID:14794, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22453] Another function of GAM139 is therefore inhibition of CDW92 (Accession NP_536856.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDW92.

[22454] Ceroid-lipofuscinosis, neuronal 8 (epilepsy, progressive with mental retardation) (CLN8, Accession NP_061764.2) is another GAM139 target gene, herein designated TARGET GENE. CLN8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLN8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLN8 BINDING SITE, designated SEQ ID:2997, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22455] Another function of GAM139 is therefore inhibition of Ceroid-lipofuscinosis, neuronal 8 (epilepsy, progressive with mental retardation) (CLN8, Accession NP_061764.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN8.

[22456] Calponin 1, basic, smooth muscle (CNN1, Accession NP_001290.2) is another GAM139 target gene, herein designated TARGET GENE. CNN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNN1 BINDING SITE, designated SEQ ID:15985, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22457] Another function of GAM139 is therefore inhibition of Calponin 1, basic, smooth muscle (CNN1, Accession

NP_001290.2), a gene which is able to inhibit the ATPase activity of myosin and may play a role in smooth muscle contraction. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNN1.

[22458] The function of CNN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM69.1.CPR8 (Accession NP_004739.2) is another GAM139 target gene, herein designated TARGET GENE. CPR8 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CPR8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPR8 BINDING SITE, designated SEQ ID:4018, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22459] Another function of GAM139 is therefore inhibition of CPR8 (Accession NP_004739.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPR8.

[22460] C-src tyrosine kinase (CSK, Accession NP_004374.1) is

another GAM139 target gene, herein designated TARGET GENE. CSK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSK BINDING SITE, designated SEQ ID:3625, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22461] Another function of GAM139 is therefore inhibition of C-src tyrosine kinase (CSK, Accession NP_004374.1), a gene which down- regulates antigen receptor signaling in T lymphocytes and the c- src oncoprotein. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSK.

[22462] The function of CSK has been established by previous studies. Partanen et al. (1991) cloned a novel cytoplasmic tyrosine kinase designated CSK. This tyrosine kinase was shown to downregulate the tyrosine kinase activity of the c- src oncoprotein (OMIM Ref. No. 190090) through tyrosine phosphorylation of the c- src carboxy terminus. Since cell transformation by SRC oncoproteins is caused by vari-

ous mechanisms that interfere with this phosphorylation, the CSK gene might function as an antioncogene (Armstrong et al., 1992). The CSK gene is ubiquitously expressed in human tissues as 2 mRNA species of 2.6 and 3.4 kb, although in some tissues and cell lines, only the larger mRNA is detected Cloutier and Veillette (1996) used the yeast 2- hybrid system to identify proteins associated with CSK. They found that the Src homology- 3 (SH3) domain of CSK associates with a proline- rich region of PEP (OMIM Ref. No. 600716), a protein- tyrosine phosphatase expressed in hemopoietic cells. Cloutier and Veillette (1996) showed that this association is highly specific and speculated that PEP may be an effector and/or regulator of CSK in T cells and other hemopoietic cells

[22463]

[22464] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22465] Armstrong, E.; Cannizzaro, L.; Bergman, M.; Huebner, K.; Alitalo, K. : The c- src tyrosine kinase (CSK) gene, a potential antioncogene, localizes to human chromosome region 15q23- q25. Cytogenet. Cell Genet. 60: 119- 120, 1992. ; and

[22466] Cloutier, J.- F.; Veillette, A. : Association of inhibitory tyrosine protein kinase p50(csk) with protein tyrosine phosphatase PEP in T cells and other hemopoietic cells. EMBO J. 15: 4909.

[22467] Further studies establishing the function and utilities of CSK are found in John Hopkins OMIM database record ID 124095, and in cited publications listed in Table 5, which are hereby incorporated by reference.DC-TM4F2 (Accession NP_112189.1) is another GAM139 target gene, herein designated TARGET GENE. DC-TM4F2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DC-TM4F2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DC-TM4F2 BINDING SITE, designated SEQ ID:16599, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22468] Another function of GAM139 is therefore inhibition of DC-TM4F2 (Accession NP_112189.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DC-TM4F2.

[22469] Dead/h (asp-glu-ala-asp/his) box polypeptide 9 (rna helicase a, nuclear dna helicase ii; leukophysin) (DDX9, Accession NP_085077.1) is another GAM139 target gene, herein designated TARGET GENE. DDX9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DDX9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX9 BINDING SITE, designated SEQ ID:7248, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22470] Another function of GAM139 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 9 (rna helicase a, nuclear dna helicase ii; leukophysin) (DDX9, Accession NP_085077.1), a gene which plays an important role in transcription, RNA processing, translation, and RNA replication. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX9.

[22471] The function of DDX9 has been established by previous studies. RNA helicases play important roles in transcription, RNA processing, translation, and RNA replication.

DEAD box proteins are putative RNA helicases that have a characteristic Asp- Glu- Ala- Asp (DEAD) box as 1 of 8 highly conserved sequence motifs. See 600396. The Drosophila 'maleless' (MLE) RNA helicase is thought to act as a regulator of X- linked gene expression. Lee and Hurwitz (1992) isolated and characterized human RNA helicase A, an abundant 130- kD nuclear enzyme of HeLa cells that unwinds double- stranded RNA in a 3- prime to 5- prime direction. By screening a HeLa cell expression library with antibodies against RNA helicase A, Lee and Hurwitz (1993) identified cDNAs encoding the enzyme. The predicted 1,279- amino acid protein shares sequence homology with the Drosophila MLE protein and other members of the DEAH subfamily of RNA helicases. The amino acid sequences of MLE and RNA helicase A are 49% identical, and antibodies against MLE recognize RNA helicase A. Northern blot analysis of HeLa cell RNA revealed RNA helicase A expression as a 4.2- kb transcript. Lee et al. (1998) isolated mouse RNA helicase A cDNAs. The predicted mouse and human proteins share 87% identity. Zhang et al. (1995) identified bovine nuclear DNA helicase II (NDHII) as the homolog of human RNA helicase A. Bovine NDHII unwinds both DNA and RNA. Zhang and

Grosse (1997) demonstrated that recombinant human RNA helicase A, or NDHII, also unwinds both double- stranded RNA and double- stranded DNA in an ATP- dependent manner. They reported that the protein contains 2 copies of a double- stranded RNA- binding domain at its N terminus, a DEIH helicase core, and a C- terminal RGG box nucleic acid- binding domain. By analysis of mutant proteins, Zhang and Grosse (1997) found that the RNA- binding domains and RGG box influence and regulate RNA helicase A activity. They suggested a model in which RNA helicase A participates in melting of DNA:RNA hybrids, such as those that occur during transcription.

[22472]

[22473] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22475] Lee, C. G.; Hurwitz, J. : A new RNA helicase isolated from HeLa cells that catalytically translocates in the 3- prime to 5- prime direction. J. Biol. Chem. 267: 4398- 4407, 1992.

[22476] Further studies establishing the function and utilities of

DDX9 are found in John Hopkins OMIM database record ID 603115, and in cited publications listed in Table 5, which are hereby incorporated by reference.Digeorge syndrome critical region gene 2 (DGCR2, Accession NP_005128.1) is another GAM139 target gene, herein designated TARGET GENE. DGCR2 BINDING SITE1 and DGCR2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DGCR2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DGCR2 BINDING SITE1 and DGCR2 BINDING SITE2, designated SEQ ID:10100 and SEQ ID:10383 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22477] Another function of GAM139 is therefore inhibition of Digeorge syndrome critical region gene 2 (DGCR2, Accession NP_005128.1), a gene which is putative adhesion receptor and intervenes in cell- cell or cell- matrix interactions and therefore may be associated with Digeorge syndrome . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Digeorge syndrome ., and of other diseases and clinical conditions associated with

DGCR2.

[22478] The function of DGCR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM84.1.DIM1 (Accession NP_006692.1) is another GAM139 target gene, herein designated TARGET GENE. DIM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DIM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIM1 BINDING SITE, designated SEQ ID:5268, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22479] Another function of GAM139 is therefore inhibition of DIM1 (Accession NP_006692.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIM1.

[22480] DKFZP434H132 (Accession NP_056307.1) is another GAM139 target gene, herein designated TARGET GENE. DKFZP434H132 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:18675, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22481] Another function of GAM139 is therefore inhibition of DKFZP434H132 (Accession NP_056307.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132.

[22482] DKFZp434N035 (Accession NP_115638.1) is another GAM139 target gene, herein designated TARGET GENE. DKFZp434N035 BINDING SITE1 and DKFZp434N035 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DKFZp434N035, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434N035 BINDING SITE1 and DKFZp434N035 BINDING SITE2, designated SEQ ID:19517 and SEQ ID:4696 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22483] Another function of GAM139 is therefore inhibition of DKFZp434N035 (Accession NP_115638.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434N035.

[22484] DKFZp434O0320 (Accession XP_097012.2) is another GAM139 target gene, herein designated TARGET GENE. DKFZp434O0320 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434O0320, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434O0320 BINDING SITE, designated SEQ ID:5662, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22485] Another function of GAM139 is therefore inhibition of DKFZp434O0320 (Accession XP_097012.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0320.

[22486] DKFZp547I048 (Accession XP_302775.1) is another GAM139 target gene, herein designated TARGET GENE.

DKFZp547I048 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547I048, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547I048 BINDING SITE, designated SEQ ID:13133, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22487] Another function of GAM139 is therefore inhibition of DKFZp547I048 (Accession XP_302775.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I048.

[22488] DKFZP564O0823 (Accession NP_056208.1) is another GAM139 target gene, herein designated TARGET GENE. DKFZP564O0823 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0823, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564O0823 BINDING SITE, designated SEQ ID:18382, to the nucleotide sequence of

GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22489] Another function of GAM139 is therefore inhibition of DKFZP564O0823 (Accession NP_056208.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0823.

[22490] Dedicator of cyto-kinesis 1 (DOCK1, Accession NP_001371.1) is another GAM139 target gene, herein designated TARGET GENE. DOCK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DOCK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DOCK1 BINDING SITE, designated SEQ ID:5679, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22491] Another function of GAM139 is therefore inhibition of Dedicator of cyto-kinesis 1 (DOCK1, Accession NP_001371.1), a gene which may function in the extension of cell surfaces. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK1.

[22492] The function of DOCK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM129.1.Dedicator of cyto-kinesis 2 (DOCK2, Accession NP_004937.1) is another GAM139 target gene, herein designated TARGET GENE. DOCK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DOCK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DOCK2 BINDING SITE, designated SEQ ID:17284, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22493] Another function of GAM139 is therefore inhibition of Dedicator of cyto-kinesis 2 (DOCK2, Accession NP_004937.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK2.

[22494] Dedicator of cyto-kinesis 2 (DOCK2, Accession XP_047961.5) is another GAM139 target gene, herein designated TARGET GENE. DOCK2 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by DOCK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DOCK2 BINDING SITE, designated SEQ ID:17284, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22495] Another function of GAM139 is therefore inhibition of Dedicator of cyto-kinesis 2 (DOCK2, Accession XP_047961.5) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK2.

[22496] ECE2 (Accession NP_055508.1) is another GAM139 target gene, herein designated TARGET GENE. ECE2 BINDING SITE1 and ECE2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ECE2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ECE2 BINDING SITE1 and ECE2 BINDING SITE2, designated SEQ ID:11759 and SEQ ID:14658 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22497] Another function of GAM139 is therefore inhibition of ECE2 (Accession NP_055508.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ECE2.

[22498] EDEM (Accession NP_055489.1) is another GAM139 target gene, herein designated TARGET GENE. EDEM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EDEM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDEM BINDING SITE, designated SEQ ID:16207, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22499] Another function of GAM139 is therefore inhibition of EDEM (Accession NP_055489.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDEM.

[22500] Endothelin 2 (EDN2, Accession NP_001947.1) is another GAM139 target gene, herein designated TARGET GENE. EDN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EDN2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDN2 BINDING SITE, designated SEQ ID:12597, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22501] Another function of GAM139 is therefore inhibition of Endothelin 2 (EDN2, Accession NP_001947.1), a gene which is a precursor of the hormone endothelin 2 which is an endothelium- derived vasoconstrictor peptide. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDN2.

[22502] The function of EDN2 has been established by previous studies. The human endothelins represent a gene family comprised of endothelin- 1 (OMIM Ref. No. 131240), endothelin- 2, and endothelin- 3 (OMIM Ref. No. 131242). Based on the deduced amino acid sequences of the cloned ET2 and ET3 genes, corresponding proteins have been chemically synthesized and their vasoconstrictor activities studied. Of the 3 isopeptides, ET- 2 has the most potent vasoconstrictor activity. Ohkubo et al. (1990) cloned cDNAs encoding human ET- 2 precursor from a cDNA library constructed with mRNA derived from the human renal

adenocarcinoma cell line, ACHN, which specifically secretes immunoreactive ET- 2. The cDNA was found to contain 1.3 kb and to encode the preproprotein consisting of 178 amino acid residues. Northern blot analysis of mRNA suggested that the transcript was 1.4 kb. Bloch et al. (1991) used a cDNA clone for endothelin- 2 to map the EDN2 gene to 1pter- p21 in human- mouse somatic cell hybrids. Southern blot hybridization demonstrated a single gene in both the human and the rat genome. Bloch et al. (1991) cloned the rat gene; the rat peptide differed from the human peptide at only 1 of 21 residues and was identical to mouse vasoactive intestinal contractor peptide (VIC). They concluded, therefore, that VIC is the mouse and rat analog of the human EDN2 gene. By Southern blot analysis of somatic cell hybrid DNAs and by in situ hybridization, Arinami et al. (1991) confirmed the assignment of EDN2 to chromosome 1 and regionalized it to 1p34. Deng et al. (1994) found in the rat that the endothelin- 2 gene is located on chromosome 5 and cosegregates strongly with systolic blood pressure in an F2 population derived from a cross of the Dahl salt- sensitive rat and the Lewis rat. Thus, ET2 is a quantitative trait locus (QTL) for blood pressure in the rat. ET1, ET3, and en-

dothelin receptor type A (ETA; 131243) in the rat did not cosegregate with blood pressure in the several F2 populations tested.

[22503]

[22504] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22505] Bloch, K. D.; Hong, C. C.; Eddy, R. L.; Shows, T. B.; Quertermous, T. : cDNA cloning and chromosomal assignment of the endothelin 2 gene: vasoactive intestinal contractor peptide is rat endothelin 2. Genomics 10: 236- 242, 1991. ; and

[22506] Deng, A. Y.; Dene, H.; Pravenec, M.; Rapp, J. P. : Genetic mapping of two new blood pressure quantitative trait loci in the rat by genotyping endothelin system genes. J. Clin. Invest. 93.

[22507] Further studies establishing the function and utilities of EDN2 are found in John Hopkins OMIM database record ID 131241, and in cited publications listed in Table 5, which are hereby incorporated by reference.Early growth response 3 (EGR3, Accession NP_004421.2) is another GAM139 target gene, herein designated TARGET GENE. EGR3 BINDING SITE is a target binding site found in the 3`

untranslated region of mRNA encoded by EGR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGR3 BINDING SITE, designated SEQ ID:18522, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22508] Another function of GAM139 is therefore inhibition of Early growth response 3 (EGR3, Accession NP_004421.2), a gene which is a putative transcription factor. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3.

[22509] The function of EGR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Eh-domain containing 2 (EHD2, Accession NP_055416.2) is another GAM139 target gene, herein designated TARGET GENE. EHD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EHD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of EHD2 BINDING SITE, designated SEQ ID:2637, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22510] Another function of GAM139 is therefore inhibition of Eh-domain containing 2 (EHD2, Accession NP_055416.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD2.

[22511] ELL (Accession NP_006523.1) is another GAM139 target gene, herein designated TARGET GENE. ELL BINDING SITE1 and ELL BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ELL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELL BINDING SITE1 and ELL BINDING SITE2, designated SEQ ID:15398 and SEQ ID:4864 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22512] Another function of GAM139 is therefore inhibition of ELL (Accession NP_006523.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL.

[22513] Epha1 (EPHA1, Accession NP_005223.1) is another GAM139 target gene, herein designated TARGET GENE. EPHA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EPHA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPHA1 BINDING SITE, designated SEQ ID:1286, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22514] Another function of GAM139 is therefore inhibition of Epha1 (EPHA1, Accession NP_005223.1), a gene which acts as a receptor for members of the ephrin- a family. binds with a low affinity to ephrin- a1. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA1.

[22515] The function of EPHA1 has been established by previous studies. The EPH and EPH- related receptors comprise the largest subfamily of receptor protein- tyrosine kinases. They have been implicated in mediating developmental events, particularly in the nervous system. Receptors in the Eph subfamily typically have a single kinase domain

and an extracellular region containing a Cys- rich domain and 2 fibronectin type III repeats. The ligands for Eph receptors have been named ephrins by the Eph Nomenclature Committee (1997). Based on their structures and sequence relationships, ephrins are divided into the ephrin-A (EFNA) class, which are anchored to the membrane by a glycosylphosphatidylinositol linkage, and the ephrin- B (EFNB) class, which are transmembrane proteins. The Eph family of receptors are divided into 2 groups based on the similarity of their extracellular domain sequences and their affinities for binding ephrin- A and ephrin- B ligands. The Eph Nomenclature Committee (1997) proposed that Eph receptors interacting preferentially with ephrin-A proteins be called EphA and Eph receptors interacting preferentially with ephrin- B proteins be called EphB. Maru et al. (1988) reported characterization of the novel receptor tyrosine kinase gene, EPH. The splicing points of kinase domain- encoding exons were completely distinct from those of other protein tyrosine kinase genes, suggesting that this is the earliest evolutionary split within this family. In Northern blot analysis, EPH gene mRNA was detected in liver, lung, kidney, and testes of rat; screening of 25 human cancers of various cell types showed prefer-

ential expression in cells of epithelial origin. Overexpression of EPH mRNA was found in a hepatoma and a lung cancer without gene amplification. Southern blot analysis of DNAs from human- mouse hybrid clones with an EPH probe showed that this gene is present on human chromosome 7. Two other receptor tyrosine kinase genes, MET (OMIM Ref. No. 164860) and EGFR (OMIM Ref. No. 131550), are on the same chromosome. By in situ hybridization, Yoshida et al. (1989) assigned the EPH locus to 7q32- q36. Although ephrins form a high- affinity multivalent complex with their receptors present on axons, axons can be rapidly repelled rather than being bound. Hattori et al. (2000) showed that ephrin- A2 (OMIM Ref. No. 602756) forms a stable complex with the metalloproteinase Kuzbanian (ADAM10; 602192), involving interactions outside the cleavage region and the protease domain. Eph receptor binding triggered ephrin- A2 cleavage in a localized reaction specific to the cognate ligand. The cleavage- inhibiting mutation in ephrin- A2 delayed axon withdrawal. Hattori et al. (2000) concluded that their studies reveal mechanisms for protease recognition and control of cell surface proteins, and, for ephrin- A2, they may provide a means for efficient axon

detachment and termination of signaling

[22516]

[22517] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22518] Hattori, M.; Osterfield, M.; Flanagan, J. G. : Regulated cleavage of a contact- mediated axon repellent. Science 289: 1360- 1365, 2000. ; and

[22520] Further studies establishing the function and utilities of EPHA1 are found in John Hopkins OMIM database record ID 179610, and in cited publications listed in Table 5, which are hereby incorporated by reference.FBG3 (Accession NP_149438.1) is another GAM139 target gene, herein designated TARGET GENE. FBG3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FBG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBG3 BINDING SITE,

designated SEQ ID:17902, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22521] Another function of GAM139 is therefore inhibition of FBG3 (Accession NP_149438.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBG3.

[22522] FBXW8 (Accession NP_036306.1) is another GAM139 target gene, herein designated TARGET GENE. FBXW8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:2670, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22523] Another function of GAM139 is therefore inhibition of FBXW8 (Accession NP_036306.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[22524] FBXW8 (Accession NP_699179.2) is another GAM139 target gene, herein designated TARGET GENE. FBXW8 BIND-

ING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:2670, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22525] Another function of GAM139 is therefore inhibition of FBXW8 (Accession NP_699179.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[22526] FLJ10613 (Accession NP_061940.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ10613 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10613, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10613 BINDING SITE, designated SEQ ID:15827, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22527] Another function of GAM139 is therefore inhibition of

FLJ10613 (Accession NP_061940.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10613.

[22528] FLJ12409 (Accession NP_079381.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ12409 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12409, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE, designated SEQ ID:4490, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22529] Another function of GAM139 is therefore inhibition of FLJ12409 (Accession NP_079381.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409.

[22530] FLJ12747 (Accession XP_290972.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ12747 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12747, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12747 BINDING SITE, designated SEQ ID:2024, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22531] Another function of GAM139 is therefore inhibition of FLJ12747 (Accession XP_290972.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12747.

[22532] FLJ12750 (Accession NP_078943.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ12750 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12750, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12750 BINDING SITE, designated SEQ ID:15623, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22533] Another function of GAM139 is therefore inhibition of FLJ12750 (Accession NP_078943.1) . Accordingly, utilities

of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12750.

[22534] FLJ12847 (Accession NP_078872.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ12847 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12847, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12847 BINDING SITE, designated SEQ ID:6207, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22535] Another function of GAM139 is therefore inhibition of FLJ12847 (Accession NP_078872.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12847.

[22536] FLJ13241 (Accession NP_079364.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ13241 BINDING SITE1 and FLJ13241 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ13241, corresponding to target binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE1 and FLJ13241 BINDING SITE2, designated SEQ ID:10155 and SEQ ID:3195 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22537] Another function of GAM139 is therefore inhibition of FLJ13241 (Accession NP_079364.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241.

[22538] FLJ14069 (Accession NP_079299.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ14069 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14069, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14069 BINDING SITE, designated SEQ ID:5034, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22539] Another function of GAM139 is therefore inhibition of

FLJ14069 (Accession NP_079299.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14069.

[22540] FLJ14936 (Accession NP_116253.2) is another GAM139 target gene, herein designated TARGET GENE. FLJ14936 BINDING SITE1 and FLJ14936 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by FLJ14936, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14936 BINDING SITE1 and FLJ14936 BINDING SITE2, designated SEQ ID:18005 and SEQ ID:17123 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22541] Another function of GAM139 is therefore inhibition of FLJ14936 (Accession NP_116253.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14936.

[22542] FLJ20315 (Accession NP_060233.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ20315

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20315, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20315 BINDING SITE, designated SEQ ID:13985, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22543] Another function of GAM139 is therefore inhibition of FLJ20315 (Accession NP_060233.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20315.

[22544] FLJ20558 (Accession NP_060350.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ20558 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20558, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20558 BINDING SITE, designated SEQ ID:18638, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22545] Another function of GAM139 is therefore inhibition of FLJ20558 (Accession NP_060350.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20558.

[22546] FLJ20699 (Accession NP_060401.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ20699 BINDING SITE1 and FLJ20699 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ20699, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20699 BINDING SITE1 and FLJ20699 BINDING SITE2, designated SEQ ID:7805 and SEQ ID:12279 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22547] Another function of GAM139 is therefore inhibition of FLJ20699 (Accession NP_060401.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20699.

[22548] FLJ21168 (Accession NP_079349.1) is another GAM139

target gene, herein designated TARGET GENE. FLJ21168 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21168, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21168 BINDING SITE, designated SEQ ID:1748, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22549] Another function of GAM139 is therefore inhibition of FLJ21168 (Accession NP_079349.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21168.

[22550] FLJ22672 (Accession NP_079173.2) is another GAM139 target gene, herein designated TARGET GENE. FLJ22672 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22672, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22672 BINDING SITE, designated SEQ ID:20087, to the nucleotide sequence of GAM139 RNA, herein designated

GAM RNA, also designated SEQ ID:327.

[22551] Another function of GAM139 is therefore inhibition of FLJ22672 (Accession NP_079173.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22672.

[22552] FLJ25168 (Accession NP_689679.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ25168 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ25168, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25168 BINDING SITE, designated SEQ ID:14009, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22553] Another function of GAM139 is therefore inhibition of FLJ25168 (Accession NP_689679.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25168.

[22554] FLJ30430 (Accession NP_694554.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ30430

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30430, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30430 BINDING SITE, designated SEQ ID:14922, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22555] Another function of GAM139 is therefore inhibition of FLJ30430 (Accession NP_694554.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30430.

[22556] FLJ32104 (Accession NP_694579.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ32104 BINDING SITE1 and FLJ32104 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ32104, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32104 BINDING SITE1 and FLJ32104 BINDING SITE2, designated SEQ ID:8933 and SEQ ID:8172 respectively, to the nucleotide sequence of

GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22557] Another function of GAM139 is therefore inhibition of FLJ32104 (Accession NP_694579.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32104.

[22558] FLJ32416 (Accession NP_653217.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ32416 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32416 BINDING SITE, designated SEQ ID:15601, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22559] Another function of GAM139 is therefore inhibition of FLJ32416 (Accession NP_653217.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32416.

[22560] FLJ36666 (Accession NP_689695.1) is another GAM139

target gene, herein designated TARGET GENE. FLJ36666 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36666, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36666 BINDING SITE, designated SEQ ID:19742, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22561] Another function of GAM139 is therefore inhibition of FLJ36666 (Accession NP_689695.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36666.

[22562] FLJ38792 (Accession NP_848615.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ38792 BINDING SITE1 and FLJ38792 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ38792, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38792 BINDING SITE1 and FLJ38792 BINDING SITE2, designated SEQ ID:9676 and

SEQ ID:6257 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22563] Another function of GAM139 is therefore inhibition of FLJ38792 (Accession NP_848615.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38792.

[22564] FLJ40852 (Accession NP_775948.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ40852 BINDING SITE1 and FLJ40852 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ40852, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40852 BINDING SITE1 and FLJ40852 BINDING SITE2, designated SEQ ID:13085 and SEQ ID:1395 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22565] Another function of GAM139 is therefore inhibition of FLJ40852 (Accession NP_775948.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ40852.

[22566] FLJ90734 (Accession NP_699206.1) is another GAM139 target gene, herein designated TARGET GENE. FLJ90734 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ90734, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90734 BINDING SITE, designated SEQ ID:15777, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22567] Another function of GAM139 is therefore inhibition of FLJ90734 (Accession NP_699206.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90734.

[22568] Formin binding protein 1 (FNBP1, Accession XP_052666.3) is another GAM139 target gene, herein designated TARGET GENE. FNBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FNBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FNBP1 BINDING SITE, designated SEQ ID:3529, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22569] Another function of GAM139 is therefore inhibition of Formin binding protein 1 (FNBP1, Accession XP_052666.3). Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNBP1.

[22570] Frizzled homolog 4 (drosophila) (FZD4, Accession NP_036325.2) is another GAM139 target gene, herein designated TARGET GENE. FZD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:2318, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22571] Another function of GAM139 is therefore inhibition of Frizzled homolog 4 (drosophila) (FZD4, Accession NP_036325.2), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled re-

ceptor family, has seven transmembrane domains and therefore may be associated with Familial exudative vitreoretinopathy. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Familial exudative vitreoretinopathy., and of other diseases and clinical conditions associated with FZD4.

[22572] The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.Gaba(a) receptor-associated protein like 1 (GABARAPL1, Accession NP_113600.1) is another GAM139 target gene, herein designated TARGET GENE. GABARAPL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GABARAPL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:1612, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22573] Another function of GAM139 is therefore inhibition of Gaba(a) receptor-associated protein like 1 (GABARAPL1, Accession NP_113600.1) . Accordingly, utilities of

GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1.

[22574] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) is another GAM139 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:19293, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22575] Another function of GAM139 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[22576] Cyclin g associated kinase (GAK, Accession NP_005246.1) is another GAM139 target gene, herein designated TARGET GENE. GAK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

GAK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAK BINDING SITE, designated SEQ ID:3648, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22577] Another function of GAM139 is therefore inhibition of Cyclin g associated kinase (GAK, Accession NP_005246.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAK.

[22578] Growth arrest-specific 7 (GAS7, Accession NP_005881.1) is another GAM139 target gene, herein designated TARGET GENE. GAS7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAS7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAS7 BINDING SITE, designated SEQ ID:6544, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22579] Another function of GAM139 is therefore inhibition of

Growth arrest-specific 7 (GAS7, Accession NP_005881.1), a gene which may play a role in promoting maturation and morphological differentiation of cerebellar neurons. and therefore may be associated with Leukemias with myeloid/lymphoid (mll). Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Leukemias with myeloid/lymphoid (mll), and of other diseases and clinical conditions associated with GAS7.

[22580] The function of GAS7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.GAS8 (Accession NP_001472.1) is another GAM139 target gene, herein designated TARGET GENE. GAS8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAS8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAS8 BINDING SITE, designated SEQ ID:11159, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22581] Another function of GAM139 is therefore inhibition of GAS8 (Accession NP_001472.1) . Accordingly, utilities of

GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS8.

[22582] GBP5 (Accession NP_443174.1) is another GAM139 target gene, herein designated TARGET GENE. GBP5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GBP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GBP5 BINDING SITE, designated SEQ ID:13996, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22583] Another function of GAM139 is therefore inhibition of GBP5 (Accession NP_443174.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBP5.

[22584] Glucosaminyl (n-acetyl) transferase 1, core 2 (beta-1,6-n-acetylglucosaminyltransferase) (GCNT1, Accession NP_001481.2) is another GAM139 target gene, herein designated TARGET GENE. GCNT1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GCNT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCNT1 BINDING SITE, designated SEQ ID:7810, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22585] Another function of GAM139 is therefore inhibition of Glucosaminyl (n-acetyl) transferase 1, core 2 (beta-1,6-n-acetylglucosaminyltransferase) (GCNT1, Accession NP_001481.2), a gene which forms critical branches in o- glycans. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT1.

[22586] The function of GCNT1 has been established by previous studies. Bierhuizen et al. (1993) provided the sequence of the developmental I antigen encoded by the cDNA for a member of a beta- 1,6- N- acetylglucosaminyltransferase gene family. By Northern blot analysis, Yeh et al. (1999) showed that multiple transcripts of GCNT1 were expressed in nearly all tissues tested, whereas expression of GCNT3 (OMIM Ref. No. 606836) was more restricted. Transcripts were also readily detected in some leukemic cell lines and in colon and cervical carcinoma cell lines, but not in a lung carcinoma cell line.

[22587]

[22588] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22589] Bierhuizen, M. F. A.; Mattei, M.- G.; Fukuda, M. : Expression of the developmental I antigen by a cloned human cDNA encoding a member of a beta- 1,6- N- acetylglucosaminyltransferase gene family. Genes Dev. 7: 468-478, 1993. ; and

[22590] Pilz, A.; Woodward, K.; Povey, S.; Abbott, C. : Comparative mapping of 50 human chromosome 9 loci in the laboratory mouse. Genomics 25: 139- 149, 1995.

[22591] Further studies establishing the function and utilities of GCNT1 are found in John Hopkins OMIM database record ID 600391, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gdp dissociation inhibitor 2 (GDI2, Accession NP_001485.2) is another GAM139 target gene, herein designated TARGET GENE. GDI2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GDI2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

GDI2 BINDING SITE, designated SEQ ID:15867, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22592] Another function of GAM139 is therefore inhibition of Gdp dissociation inhibitor 2 (GDI2, Accession NP_001485.2), a gene which regulates the gdp/gtp exchange reaction of most rab proteins by inhibiting the dissociation of gdp from them, and the subsequent binding of gtp to them. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDI2.

[22593] The function of GDI2 has been established by previous studies. Various rab GDI- beta (RABGDIB) genes have been identified in a variety of species. It is a member of the GDP- dissociation inhibitor family, which includes GDI-alpha (RABGDIA; 300104). Shisheva et al. (1994) cloned mouse RABGDIB (which they referred to as 'smg p25A GDI') and reported the sequence. Sedlacek et al. (1995) found that the human RABGDIB sequence is 86.5% similar to RABGDIA, which they referred to as 'XAP- 4.' Bachner et al. (1995) studied expression patterns of the 2 human genes. They showed that the 2.5- kb mRNA for RABGDIB is ubiquitously expressed, in contrast to RABGDIA, which

is expressed primarily in neural and sensory tissues. By in situ hybridization, Sedlacek et al. (1998) demonstrated that the GDI2 gene maps to 10p15; a processed pseudo-gene mapped to 7p13- p11.

[22594]

[22595] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22596] Sedlacek, Z.; Munstermann, E.; Mincheva, A.; Lichter, P.; Poustka, A. : The human rab GDI beta gene with long retroposon- rich introns maps to 10p15 and its pseudo-gene to 7p11- p13. Mammalian Genome 9: 78- 80, 1998. ; and

[22597] Shisheva, A.; Sudhof, T. C.; Czech, M. P. : Cloning, characterization, and expression of a novel GDP dissociation inhibitor isoform from skeletal muscle. Molec. Cell. Biol. 14: 3459- 346.

[22598] Further studies establishing the function and utilities of GDI2 are found in John Hopkins OMIM database record ID 600767, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glial fibrillary acidic protein (GFAP, Accession NP_002046.1) is another GAM139 target gene, herein designated TARGET GENE.

GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GFAP BINDING SITE, designated SEQ ID:5626, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22599] Another function of GAM139 is therefore inhibition of Glial fibrillary acidic protein (GFAP, Accession NP_002046.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFAP.

[22600] Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NP_619581.1) is another GAM139 target gene, herein designated TARGET GENE. GGA2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GGA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE, designated SEQ ID:10502, to the nucleotide sequence of GAM139

RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22601] Another function of GAM139 is therefore inhibition of Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NP_619581.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2.

[22602] GK001 (Accession NP_064583.1) is another GAM139 target gene, herein designated TARGET GENE. GK001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GK001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GK001 BINDING SITE, designated SEQ ID:15464, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22603] Another function of GAM139 is therefore inhibition of GK001 (Accession NP_064583.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GK001.

[22604] Golgi autoantigen, golgin subfamily a, 1 (GOLGA1, Acces-

sion NP_002068.1) is another GAM139 target gene, herein designated TARGET GENE. GOLGA1 BINDING SITE1 and GOLGA1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GOLGA1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE1 and GOLGA1 BINDING SITE2, designated SEQ ID:426 and SEQ ID:14520 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22605] Another function of GAM139 is therefore inhibition of Golgi autoantigen, golgin subfamily a, 1 (GOLGA1, Accession NP_002068.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1.

[22606] Golgi snap receptor complex member 1 (GOSR1, Accession NP_004862.1) is another GAM139 target gene, herein designated TARGET GENE. GOSR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GOSR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of GOSR1 BINDING SITE, designated SEQ ID:16929, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22607] Another function of GAM139 is therefore inhibition of Golgi snap receptor complex member 1 (GOSR1, Accession NP_004862.1), a gene which may regulate vesicle transport, docking, and fusion. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOSR1.

[22608] The function of GOSR1 has been established by previous studies. The specificity of vesicular transport is thought to be determined by correct pairing of vesicle- associated SNAREs (v- SNAREs) with those on the target membrane (t- SNAREs). This complex then recruits soluble NSF attachment proteins (SNAPs) and N- ethylmaleimide- sensitive factor (NSF; 601633) to form a 20S fusion (or SNARE) complex. See SNAPA (OMIM Ref. No. 603215). Nagahama et al. (1996) identified GOS28, a putative Golgi v- SNARE of 28 kD that localized primarily to transport vesicles at the terminal rims of Golgi stacks. They demonstrated that GOS28 plays a role in intra- Golgi transport. Subramaniam et al. (1996) isolated cDNAs encoding rat GOS28, which

they called p28 or GS28 (Golgi SNARE of 28 kD). Sequence analysis revealed that the predicted protein contained a central coiled- coil domain and a C- terminal membrane anchor. The authors found that GS28 is a core component of the Golgi 20S SNARE complex that participates in the docking or fusion stage of endoplasmic reticulum- Golgi transport. Lowe et al. (1997) reported that GS28 plays a role in transport from the endoplasmic reticulum to the cis- (inside face) and medial- Golgi, while the GS27 (OMIM Ref. No. 604027) Golgi SNARE participates in protein movement from the medial- Golgi towards the trans- Golgi (plasma- membrane face) and the trans- Golgi net- work. By searching EST databases using the rat GS28 pro- tein sequence, Bui et al. (1999) identified human GS28 cDNAs. The deduced 250- amino acid human protein is 97% identical to rat GS28. Independently, Mao et al. (1998) identified a human GOS28 cDNA among a collec- tion of cDNAs expressed in hematopoietic stem/ progenitor cells.

[22609]

[22610] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22611] Bui, T. D.; Levy, E. R.; Subramaniam, V. N.; Lowe, S. L.; Hong, W. : cDNA characterization and chromosomal mapping of human Golgi SNARE GS27 and GS28 to chromosome 17. Genomics 57: 285- 288, 1999. ; and

[22612] Nagahama, M.; Orci, L.; Ravazzola, M.; Amherdt, M.; Lacomis, L.; Tempst, P.; Rothman, J. E.; Sollner, T. H. : A v-SNARE implicated in intra- Golgi transport. J. Cell Biol. 133: 507- 516.

[22613] Further studies establishing the function and utilities of GOSR1 are found in John Hopkins OMIM database record ID 604026, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glycosylphosphatidylinositol specific phospholipase d1 (GPLD1, Accession NP_001494.2) is another GAM139 target gene, herein designated TARGET GENE. GPLD1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GPLD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPLD1 BINDING SITE, designated SEQ ID:2598, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22614] Another function of GAM139 is therefore inhibition of Glycosylphosphatidylinositol specific phospholipase d1 (GPLD1, Accession NP_001494.2), a gene which hydrolyses the inositol phosphate linkage in proteins anchored by phosphatidylinositol glycans to release these proteins from the membrane. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPLD1.

[22615] The function of GPLD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.G protein-coupled receptor 108 (GPR108, Accession XP_290854.1) is another GAM139 target gene, herein designated TARGET GENE. GPR108 BINDING SITE1 and GPR108 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GPR108, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR108 BINDING SITE1 and GPR108 BINDING SITE2, designated SEQ ID:790 and SEQ ID:14653 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22616] Another function of GAM139 is therefore inhibition of G protein-coupled receptor 108 (GPR108, Accession XP_290854.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR108.

[22617] GPR124 (Accession NP_116166.6) is another GAM139 target gene, herein designated TARGET GENE. GPR124 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR124, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR124 BINDING SITE, designated SEQ ID:3798, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22618] Another function of GAM139 is therefore inhibition of GPR124 (Accession NP_116166.6) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR124.

[22619] G protein-coupled receptor 35 (GPR35, Accession NP_005292.1) is another GAM139 target gene, herein designated TARGET GENE. GPR35 BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by GPR35, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR35 BINDING SITE, designated SEQ ID:20062, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22620] Another function of GAM139 is therefore inhibition of G protein-coupled receptor 35 (GPR35, Accession NP_005292.1), a gene which transduces a variety of hormone, endogenous peptide, and neurotransmitter signals into intracellular effects via G proteins. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR35.

[22621] The function of GPR35 has been established by previous studies. G protein- coupled receptors (GPRs, or GPCRs) contain 7 hydrophobic transmembrane domains embedded in hydrophilic intra- and extracellular loops and transduce a variety of hormone, endogenous peptide, and neurotransmitter signals into intracellular effects via G proteins (see OMIM Ref. No. 601047 and 601908).

O'Dowd et al. (1998) searched for genes related to GPR1 (OMIM Ref. No. 600239) by PCR of genomic DNA with degenerate primers based on the conserved transmembrane regions. They identified the GPR35 gene, which encodes a predicted 309- amino acid protein. Horikawa et al. (2000) identified the GPR35 gene in a 66- kb interval on chromosome 2 that showed linkage to noninsulin- dependent diabetes mellitus (NIDDM1; 601283). They detected GPR35 expression in all fetal and adult human tissues examined, with relatively higher levels in adult lung, small intestine, colon, and stomach. They observed transcripts of 2.4 and 4.4 kb in most tissues, and a single 9.4- kb transcript in skeletal muscle. The GPR35 gene consists of a single exon. Single- nucleotide polymorphisms (SNPs) in GPR35 did not show association with or linkage to type 2 diabetes.

[22622]

[22623] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22624] Horikawa, Y.; Oda, N.; Cox, N. J.; Li, X.; Orho- Melander, M.; Hara, M.; Hinokio, Y.; Lindner, T. H.; Mashima, H.; Schwarz, P. E. H.; del Bosque- Plata, L.; Horikawa, Y.; and

[22625] O'Dowd, B. F.; Nguyen, T.; Marchese, A.; Cheng, R.; Lynch, K. R.; Heng, H. H. Q.; Kolakowski, L. F., Jr.; George, S. R. : Discovery of three novel G- protein- coupled receptor genes. Gen.

[22626] Further studies establishing the function and utilities of GPR35 are found in John Hopkins OMIM database record ID 602646, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glutamate receptor interacting protein 1 (GRIP1, Accession XP_290559.2) is another GAM139 target gene, herein designated TARGET GENE. GRIP1 BINDING SITE1 and GRIP1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GRIP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRIP1 BINDING SITE1 and GRIP1 BINDING SITE2, designated SEQ ID:10480 and SEQ ID:7684 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22627] Another function of GAM139 is therefore inhibition of Glutamate receptor interacting protein 1 (GRIP1, Accession XP_290559.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIP1.

[22628] HIP14 (Accession NP_056151.1) is another GAM139 target gene, herein designated TARGET GENE. HIP14 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HIP14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIP14 BINDING SITE, designated SEQ ID:15808, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22629] Another function of GAM139 is therefore inhibition of HIP14 (Accession NP_056151.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP14.

[22630] High mobility group at-hook 1 (HMGA1, Accession NP_665906.1) is another GAM139 target gene, herein designated TARGET GENE. HMGA1 BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by HMGA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMGA1 BINDING SITE, designated SEQ ID:11875, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22631] Another function of GAM139 is therefore inhibition of High mobility group at-hook 1 (HMGA1, Accession NP_665906.1), a gene which orchestrates the assembly of a virus- induced enhanceosome by mediating a network of protein- DNA and protein- protein interactions . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA1.

[22632] The function of HMGA1 has been established by previous studies. Aberrant expression of MYC (OMIM Ref. No. 190080) plays an important role in the pathogenesis of several human malignancies, most notably Burkitt lymphoma (OMIM Ref. No. 113970). MYC functions as a transcription factor that works in conjunction with a partner protein, MAX (OMIM Ref. No. 154950). There are numerous target genes of MYC, including CAD (OMIM Ref. No.

114010), which is required for DNA synthesis, and ODC (OMIM Ref. No. 165640) and telomerase (see OMIM Ref. No. TERT; 187270), which are involved in neoplastic transformation. By mutagenesis analysis of the HMGIY promoter, Wood et al. (2000) identified a MYC- MAX consensus DNA- binding site, an E box at nucleotide - 1337. Northern blot analysis detected enhanced expression of HMGIY after stimulation by hydroxytamoxifen in a cell line expressing a MYC- estradiol receptor fusion protein. MYC- deficient fibroblasts had reduced expression of HMGIY. Western blot analysis detected increased expression of HMGIY protein in Burkitt lymphoma cell lines compared with Epstein- Barr virus- transformed B lymphocytes from a normal individual. An antisense construct decreased HMGIY protein expression, abrogated transformation of Burkitt lymphoma cells, and decreased the cell growth rate. Rat and human cell lines overexpressing HMGIY formed colonies in soft agar, and the rat cell line was tumorigenic in athymic nude mice. The results suggested that HMGIY is a potential oncogene. HMGIY orchestrates the assembly of a virus- induced enhanceosome, which consists of nuclear factor kappa- B (NFKB; 164011), interferon regulatory factors (e.g., IRF1;

147575), and ATF2 (OMIM Ref. No. 123811)/JUN (see OMIM Ref. No. 165160), by mediating a network of protein- DNA and protein- protein interactions (Thanos and Maniatis, 1995). The enhanceosome, which is assembled in a nucleosome- free enhancer region, activates transcription of beta- interferon (IFNB; 147640) through a program of chromatin- modifying activities that target a strategically positioned nucleosome that masks the TATA box and start site of transcription (Agalioti et al., 2000). Enhanceosome- activated transcription requires the recruitment of histone acetyltransferase proteins that modify histones and acetylate HMGIY. Munshi et al. (2001) showed that the accurate execution of the IFNB transcriptional switch depends on the ordered acetylation of HMGIY by CREB- binding protein (CBP; 600140) and p300/CBP-associated factor (PCAF; 602303)/GCN5 (OMIM Ref. No. 602301). Acetylation of HMGIY by CBP at lys65 destabilizes the enhanceosome, whereas acetylation by PCAF/GCN5 at lys71, which lies in a critical protein- protein interaction domain, potentiates transcription by stabilizing the enhanceosome and by preventing acetylation by CBP. [22633]

[22634] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[22635] Wood, L. J.; Mukherjee, M.; Dolde, C. E.; Xu, Y.; Maher, J. F.; Bunton, T. E.; Williams, J. B.; Resar, L. M. S. : HMG- I/Y, a new c- Myc target gene and potential oncogene. Molec. Cell Biol. 20: 5490- 5502, 2000. ; and

[22648] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22649] Wood, L. J.; Mukherjee, M.; Dolde, C. E.; Xu, Y.; Maher, J. F.; Bunton, T. E.; Williams, J. B.; Resar, L. M. S. : HMG- I/Y, a new c- Myc target gene and potential oncogene. Molec. Cell Biol. 20: 5490- 5502, 2000. ; and

[22650] Munshi, N.; Agalioti, T.; Lomvardas, S.; Merika, M.; Chen, G.; Thanos, D. : Coordination of a transcriptional switch by HMGI(Y) acetylation. Science 293: 1133- 1136, 2001.

[22651] Further studies establishing the function and utilities of HMGA1 are found in John Hopkins OMIM database record ID 600701, and in cited publications listed in Table 5,

which are hereby incorporated by reference.High mobility group at-hook 1 (HMGA1, Accession NP_665908.1) is another GAM139 target gene, herein designated TARGET GENE. HMGA1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HMGA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMGA1 BINDING SITE, designated SEQ ID:11875, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22652] Another function of GAM139 is therefore inhibition of High mobility group at-hook 1 (HMGA1, Accession NP_665908.1), a gene which orchestrates the assembly of a virus- induced enhanceosome by mediating a network of protein- DNA and protein- protein interactions . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA1.

[22653] The function of HMGA1 has been established by previous studies. Aberrant expression of MYC (OMIM Ref. No. 190080) plays an important role in the pathogenesis of

several human malignancies, most notably Burkitt lymphoma (OMIM Ref. No. 113970). MYC functions as a transcription factor that works in conjunction with a partner protein, MAX (OMIM Ref. No. 154950). There are numerous target genes of MYC, including CAD (OMIM Ref. No. 114010), which is required for DNA synthesis, and ODC (OMIM Ref. No. 165640) and telomerase (see OMIM Ref. No. TERT; 187270), which are involved in neoplastic transformation. By mutagenesis analysis of the HMGIY promoter, Wood et al. (2000) identified a MYC- MAX consensus DNA- binding site, an E box at nucleotide - 1337. Northern blot analysis detected enhanced expression of HMGIY after stimulation by hydroxytamoxifen in a cell line expressing a MYC- estradiol receptor fusion protein. MYC- deficient fibroblasts had reduced expression of HMGIY. Western blot analysis detected increased expression of HMGIY protein in Burkitt lymphoma cell lines compared with Epstein- Barr virus- transformed B lymphocytes from a normal individual. An antisense construct decreased HMGIY protein expression, abrogated transformation of Burkitt lymphoma cells, and decreased the cell growth rate. Rat and human cell lines overexpressing HMGIY formed colonies in soft agar, and the rat cell line

was tumorigenic in athymic nude mice. The results suggested that HMGIY is a potential oncogene. HMGIY orchestrates the assembly of a virus- induced enhanceosome, which consists of nuclear factor kappa- B (NFKB; 164011), interferon regulatory factors (e.g., IRF1; 147575), and ATF2 (OMIM Ref. No. 123811)/JUN (see OMIM Ref. No. 165160), by mediating a network of protein- DNA and protein- protein interactions (Thanos and Maniatis, 1995). The enhanceosome, which is assembled in a nucleosome- free enhancer region, activates transcription of beta- interferon (IFNB; 147640) through a program of chromatin- modifying activities that target a strategically positioned nucleosome that masks the TATA box and start site of transcription (Agalioti et al., 2000). Enhanceosome- activated transcription requires the recruitment of histone acetyltransferase proteins that modify histones and acetylate HMGIY. Munshi et al. (2001) showed that the accurate execution of the IFNB transcriptional switch depends on the ordered acetylation of HMGIY by CREB- binding protein (CBP; 600140) and p300/CBP-associated factor (PCAF; 602303)/GCN5 (OMIM Ref. No. 602301). Acetylation of HMGIY by CBP at lys65 destabilizes the enhanceosome, whereas acetylation by PCAF/

GCN5 at lys71, which lies in a critical protein- protein interaction domain, potentiates transcription by stabilizing the enhanceosome and by preventing acetylation by CBP.

[22654]

[22686] Further studies establishing the function and utilities of HMGA1 are found in John Hopkins OMIM database record ID 600701, and in cited publications listed in Table 5, which are hereby incorporated by reference.HP43.8KD (Accession NP_115946.2) is another GAM139 target gene, herein designated TARGET GENE. HP43.8KD BINDING SITE1 and HP43.8KD BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HP43.8KD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HP43.8KD BINDING SITE1 and HP43.8KD BINDING SITE2, designated SEQ ID:13643 and SEQ ID:11596 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22687] Another function of GAM139 is therefore inhibition of HP43.8KD (Accession NP_115946.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HP43.8KD.

[22688] Hippocalcin-like 1 (HPCAL1, Accession NP_602293.1) is another GAM139 target gene, herein designated TARGET GENE. HPCAL1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by HPCAL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPCAL1 BINDING SITE, designated SEQ ID:15809, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22689] Another function of GAM139 is therefore inhibition of

Hippocalcin-like 1 (HPCAL1, Accession NP_602293.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1.

[22690] Hermansky-pudlak syndrome 4 (HPS4, Accession NP_690053.1) is another GAM139 target gene, herein designated TARGET GENE. HPS4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HPS4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS4 BINDING SITE, designated SEQ ID:14923, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22691] Another function of GAM139 is therefore inhibition of Hermansky-pudlak syndrome 4 (HPS4, Accession NP_690053.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS4.

[22692] Hermansky-pudlak syndrome 4 (HPS4, Accession NP_690054.1) is another GAM139 target gene, herein designated TARGET GENE. HPS4 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HPS4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS4 BINDING SITE, designated SEQ ID:14923, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22693] Another function of GAM139 is therefore inhibition of Hermansky-pudlak syndrome 4 (HPS4, Accession NP_690054.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS4.

[22694] Hermansky-pudlak syndrome 4 (HPS4, Accession NP_690055.1) is another GAM139 target gene, herein designated TARGET GENE. HPS4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HPS4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS4 BINDING SITE, designated SEQ ID:14923, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA,

also designated SEQ ID:327.

[22695] Another function of GAM139 is therefore inhibition of Hermansky-pudlak syndrome 4 (HPS4, Accession NP_690055.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS4.

[22696] Hermansky-pudlak syndrome 4 (HPS4, Accession NP_071364.4) is another GAM139 target gene, herein designated TARGET GENE. HPS4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HPS4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS4 BINDING SITE, designated SEQ ID:14923, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22697] Another function of GAM139 is therefore inhibition of Hermansky-pudlak syndrome 4 (HPS4, Accession NP_071364.4) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS4.

[22698] Hermansky-pudlak syndrome 4 (HPS4, Accession

NP_690056.1) is another GAM139 target gene, herein designated TARGET GENE. HPS4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HPS4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS4 BINDING SITE, designated SEQ ID:14923, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22699] Another function of GAM139 is therefore inhibition of Hermansky-pudlak syndrome 4 (HPS4, Accession NP_690056.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS4.

[22700] HSA250839 (Accession NP_060871.1) is another GAM139 target gene, herein designated TARGET GENE. HSA250839 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSA250839, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSA250839 BINDING SITE, designated SEQ ID:15722, to

the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22701] Another function of GAM139 is therefore inhibition of HSA250839 (Accession NP_060871.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA250839.

[22702] HUMAGCGB (Accession XP_291083.2) is another GAM139 target gene, herein designated TARGET GENE. HUMAGCGB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HUMAGCGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:10384, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22703] Another function of GAM139 is therefore inhibition of HUMAGCGB (Accession XP_291083.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB.

[22704] HUMAGCGB (Accession NP_037418.2) is another GAM139 target gene, herein designated TARGET GENE. HUMAGCGB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HUMAGCGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:10384, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22705] Another function of GAM139 is therefore inhibition of HUMAGCGB (Accession NP_037418.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB.

[22706] Hypoxia up-regulated 1 (HYOU1, Accession NP_006380.1) is another GAM139 target gene, herein designated TARGET GENE. HYOU1 BINDING SITE1 and HYOU1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HYOU1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of HYOU1 BINDING SITE1 and HYOU1 BINDING SITE2, designated SEQ ID:3370 and SEQ ID:5055 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22707] Another function of GAM139 is therefore inhibition of Hypoxia up-regulated 1 (HYOU1, Accession NP_006380.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYOU1.

[22708] Isoprenylcysteine carboxyl methyltransferase (ICMT, Accession NP_733806.1) is another GAM139 target gene, herein designated TARGET GENE. ICMT BINDING SITE1 and ICMT BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ICMT, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICMT BINDING SITE1 and ICMT BINDING SITE2, designated SEQ ID:8391 and SEQ ID:6960 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22709] Another function of GAM139 is therefore inhibition of Iso-

prenylcysteine carboxyl methyltransferase (ICMT, Accession NP_733806.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICMT.

[22710] Immunoglobulin superfamily, member 4 (IGSF4, Accession NP_055148.2) is another GAM139 target gene, herein designated TARGET GENE. IGSF4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGSF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGSF4 BINDING SITE, designated SEQ ID:15663, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22711] Another function of GAM139 is therefore inhibition of Immunoglobulin superfamily, member 4 (IGSF4, Accession NP_055148.2), a gene which Low similarity to viral receptors and adhesion molecules and contains immunoglobulin domains. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGSF4.

[22712] The function of IGSF4 has been established by previous

studies. Loss of genetic material at the cytogenetic level and loss of heterozygosity (LOH) are frequently observed in tumors. The 11q22- q24 region has deletions or LOH in a variety of tumor types. Replacement of the missing copy of chromosome 11 in the A549 adenocarcinoma cell line with a normal chromosome 11 reversed tumorigenicity in nude mice, suggesting the existence of a tumor suppressor gene (Satoh et al., 1993). By constructing a BAC, PAC, and P1 contig map covering a YAC clone of part of chromosome 11q, EST mapping, exon trapping, and cDNA library screening, Gomyo et al. (1999) isolated a cDNA encoding IGSF4. The predicted 442- amino acid protein contains a signal peptide and a transmembrane domain. IGSF4 shares 65% identity with neural cell adhesion molecule- 1 (NCAM1; 116930) and NCAM2 (OMIM Ref. No. 602040) within their Ig- like C2- type domains. Northern blot analysis revealed expression of a 4.4- kb transcript in all tissues tested except leukocytes. Genomic sequence analysis determined that the IGSF4 gene contains 10 exons and spans 300 kb. SSCP analysis showed that all breast cancer and neuroblastoma tissues tested possessed a deletion of 1 allele of the IGSF4 gene. Gomyo et al. (1999), however, were unable to conclude that IGSF4

is a tumor suppressor Biederer et al. (2002) identified SynCAM by searching sequence databanks for vertebrate proteins with extracellular immunoglobulin domains and an intracellular PDZ- domain protein- interaction sequence. Although SynCAM mRNA is widely distributed, antibodies against the protein reacted with multiple bands that were detected only in brain. The multiple SynCAM bands are due to complex N- glycosylation, because enzymatic removal of N- linked carbohydrates converted these bands into a single species of approximately 45 kD, whereas no O- glycosylation of SynCAM was observed. Biederer et al. (2002) showed that SynCAM functions as a homophilic cell adhesion molecule at the synapse. Expression of the isolated cytoplasmic tail of SynCAM in neurons inhibited synapse assembly. Conversely, expression of full- length SynCAM in nonneuronal cells induced synapse formation by cocultured hippocampal neurons with normal release properties. Glutamatergic synaptic transmission was reconstituted in these nonneuronal cells by coexpressing glutamate receptors with SynCAM, which suggests that a single type of adhesion molecule and glutamate receptor are sufficient for a functional postsynaptic response

[22713]

[22717] Further studies establishing the function and utilities of IGSF4 are found in John Hopkins OMIM database record ID 605686, and in cited publications listed in Table 5, which are hereby incorporated by reference.IL-17RE (Accession NP_653241.1) is another GAM139 target gene, herein designated TARGET GENE. IL-17RE BINDING SITE1 through IL-17RE BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by IL-17RE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of IL-17RE BINDING SITE1 through IL-17RE BINDING SITE3, designated SEQ ID:1468, SEQ ID:1468 and SEQ ID:19627 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22718] Another function of GAM139 is therefore inhibition of IL-17RE (Accession NP_653241.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL-17RE.

[22719] IL-17RE (Accession NP_653241.1) is another GAM139 target gene, herein designated TARGET GENE. IL-17RE BINDING SITE1 through IL-17RE BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by IL-17RE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL-17RE BINDING SITE1 through IL-17RE BINDING SITE3, designated SEQ ID:19627, SEQ ID:14593 and SEQ ID:14593 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22720] Another function of GAM139 is therefore inhibition of IL-17RE (Accession NP_653241.1) . Accordingly, utilities of

GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL-17RE.

[22721] Integrin-linked kinase-associated serine/threonine phosphatase 2c (ILKAP, Accession NP_789769.1) is another GAM139 target gene, herein designated TARGET GENE. ILKAP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ILKAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ILKAP BINDING SITE, designated SEQ ID:9889, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22722] Another function of GAM139 is therefore inhibition of Integrin-linked kinase-associated serine/threonine phosphatase 2c (ILKAP, Accession NP_789769.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILKAP.

[22723] Integrin-linked kinase-associated serine/threonine phosphatase 2c (ILKAP, Accession NP_110395.1) is another GAM139 target gene, herein designated TARGET GENE. ILKAP BINDING SITE is a target binding site found in the 5`

untranslated region of multiple transcripts of mRNA encoded by ILKAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ILKAP BINDING SITE, designated SEQ ID:9889, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22724] Another function of GAM139 is therefore inhibition of Integrin-linked kinase-associated serine/threonine phosphatase 2c (ILKAP, Accession NP_110395.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILKAP.

[22725] Potassium large conductance calcium-activated channel, subfamily m, beta member 1 (KCNMB1, Accession NP_004128.1) is another GAM139 target gene, herein designated TARGET GENE. KCNMB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KCNMB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNMB1 BINDING SITE, designated SEQ ID:8103, to the nucleotide se-

quence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22726] Another function of GAM139 is therefore inhibition of Potassium large conductance calcium-activated channel, subfamily m, beta member 1 (KCNMB1, Accession NP_004128.1), a gene which is a potassium channel protein which may modulate the properties of the pore-forming alpha subunit. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB1.

[22727] The function of KCNMB1 has been established by previous studies. Large conductance, voltage- and calcium- sensitive potassium (MaxiK) channels are fundamental in the control of smooth muscle tone and neuronal excitability. MaxiK channels can be formed by 2 subunits: the pore-forming alpha subunit (HSLO; 600150) and the modulatory beta subunit. MaxiK channels are sensitive to external application of several peptidyl toxins, such as charybdotoxin (ChTX), which bind with high affinity to a receptor site located in the external vestibule of the channel and prevent potassium flux by physical occlusion of the pore. Knaus et al. (1994) demonstrated that ChTX is specifically bound to the 31- kD beta subunit of the bovine tracheal

smooth muscle MaxiK channel. They cloned cDNAs encoding the bovine beta subunit and found that the predicted protein contains 2 putative transmembrane domains. Under nondenaturing conditions, antibodies against the beta subunit immunoprecipitated both the alpha and beta subunits of the channel, demonstrating that, in vivo, the MaxiK channel exists as a multimer containing both alpha and beta subunits. Knaus et al. (1994) noted that the beta subunit must be in close proximity to the pore since ChTX, which blocks the pore on the alpha-subunit, is covalently incorporated into the beta subunit. Calcium regulation of gene expression is critical for the long lasting activity- dependent changes in cellular electrical properties that underlie important physiologic functions such as learning and memory. Cellular electrical properties are diversified through the extensive alternative splicing of ion channel pre- mRNAs. The STREX exon of Slo confers higher calcium sensitivity on the channel. Xie and Black (2001) demonstrated that the depolarization of rat pituitary cells represses splicing of the STREX exon in BK potassium channel transcripts through the activation of calcium/calmodulin- dependent protein kinases. Overexpressing constitutively active CAMK4 (OMIM Ref. No.

114080), but not CAMK1 (OMIM Ref. No. 604998) or CAMK2 (OMIM Ref. No. 114078), specifically decreases STREX inclusion in the mRNA. This decrease is prevented by mutations in particular RNA repressor sequences. Transferring 54 nucleotides from the 3- prime splice site upstream of STREX to a heterologous gene is sufficient to confer CAMK4 repression on an otherwise constitutive exon. Xie and Black (2001) concluded that their experiments define a CAMK4- responsive RNA element (CaRRE), which mediates the alternative splicing of ion channel pre- mRNAs. The CaRRE presents a unique molecular target for inducing long- term adaptive changes in cellular electrical properties. It also provides a model system for dissecting the effect of signal transduction pathways on alternative splicing

[22728] Animal model experiments lend further support to the function of KCNMB1. Small arteries exhibit tone, a partially contracted state that is an important determinant of blood pressure. In arterial smooth muscle cells, intracellular calcium paradoxically controls both contraction and relaxation. Calcium- dependent relaxation is mediated by local calcium release from the sarcoplasmic reticulum. These 'calcium sparks' activate calcium- dependent

potassium (BK) channels comprised of alpha- and beta- 1 subunits. Brenner et al. (2000) showed that targeted deletion of the gene for the beta- 1 subunit leads to a decrease in the calcium sensitivity of BK channels, a reduction in functional coupling of calcium sparks to BK channel activation, and increases in arterial tone and blood pressure. The beta- 1 subunit of the BK channel, by tuning the channel's calcium sensitivity, is a key molecular component in translating calcium signals to the central physiologic function of vasoregulation.

[22729] It is appreciated that the abovementioned animal model for KCNMB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22730] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22731] Xie, J.; Black, D. L. : A CaMK IV responsive RNA element mediates depolarization- induced alternative splicing of ion channels. Nature 410: 936- 439, 2001. ; and

[22732] Brenner, R.; Perez, G. J.; Bonev, A. D.; Eckman, D. M.; Kosek, J. C.; Wiler, S. W.; Patterson, A. J.; Nelson, M. T.; Aldrich, R. W. : Vasoregulation by the beta- 1 subunit of

the calcium.

[22733] Further studies establishing the function and utilities of KCNMB1 are found in John Hopkins OMIM database record ID 603951, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium intermediate/small conductance calcium-activated channel, subfamily n, member 2 (KCNN2, Accession NP_067627.2) is another GAM139 target gene, herein designated TARGET GENE. KCNN2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KCNN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNN2 BINDING SITE, designated SEQ ID:3750, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22734] Another function of GAM139 is therefore inhibition of Potassium intermediate/small conductance calcium-activated channel, subfamily n, member 2 (KCNN2, Accession NP_067627.2), a gene which forms a voltage- independent potassium channel activated by intracellular calcium. Accordingly, utilities of GAM139 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with KCNN2.

[22735] The function of KCNN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.KIAA0182 (Accession XP_050495.4) is another GAM139 target gene, herein designated TARGET GENE. KIAA0182 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:6545, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22736] Another function of GAM139 is therefore inhibition of KIAA0182 (Accession XP_050495.4) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182.

[22737] KIAA0247 (Accession NP_055549.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0247 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA0247, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:18761, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22738] Another function of GAM139 is therefore inhibition of KIAA0247 (Accession NP_055549.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247.

[22739] KIAA0290 (Accession NP_055937.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0290 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0290, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0290 BINDING SITE, designated SEQ ID:8089, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22740] Another function of GAM139 is therefore inhibition of

KIAA0290 (Accession NP_055937.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0290.

[22741] KIAA0459 (Accession XP_027862.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0459 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:9393, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22742] Another function of GAM139 is therefore inhibition of KIAA0459 (Accession XP_027862.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459.

[22743] KIAA0475 (Accession NP_055679.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0475 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:14521, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22744] Another function of GAM139 is therefore inhibition of KIAA0475 (Accession NP_055679.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475.

[22745] KIAA0514 (Accession NP_055511.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0514 BINDING SITE1 and KIAA0514 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0514, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE1 and KIAA0514 BINDING SITE2, designated SEQ ID:14213 and SEQ ID:11461 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22746] Another function of GAM139 is therefore inhibition of KIAA0514 (Accession NP_055511.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514.

[22747] KIAA0570 (Accession XP_291018.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0570 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0570, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0570 BINDING SITE, designated SEQ ID:7196, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22748] Another function of GAM139 is therefore inhibition of KIAA0570 (Accession XP_291018.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0570.

[22749] KIAA0652 (Accession NP_055556.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0652 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA0652, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0652 BINDING SITE, designated SEQ ID:7082, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22750] Another function of GAM139 is therefore inhibition of KIAA0652 (Accession NP_055556.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652.

[22751] KIAA0683 (Accession NP_057195.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0683 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0683, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0683 BINDING SITE, designated SEQ ID:17564, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22752] Another function of GAM139 is therefore inhibition of

KIAA0683 (Accession NP_057195.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0683.

[22753] KIAA0863 (Accession NP_055728.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0863 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0863, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0863 BINDING SITE, designated SEQ ID:4169, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22754] Another function of GAM139 is therefore inhibition of KIAA0863 (Accession NP_055728.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0863.

[22755] KIAA0962 (Accession XP_290942.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA0962 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0962, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0962 BINDING SITE, designated SEQ ID:19480, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22756] Another function of GAM139 is therefore inhibition of KIAA0962 (Accession XP_290942.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0962.

[22757] KIAA1223 (Accession XP_048747.2) is another GAM139 target gene, herein designated TARGET GENE. KIAA1223 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:15273, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22758] Another function of GAM139 is therefore inhibition of KIAA1223 (Accession XP_048747.2) . Accordingly, utilities

of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223.

[22759] KIAA1399 (Accession XP_046685.4) is another GAM139 target gene, herein designated TARGET GENE. KIAA1399 BINDING SITE1 and KIAA1399 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1399, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1399 BINDING SITE1 and KIAA1399 BINDING SITE2, designated SEQ ID:17214 and SEQ ID:12571 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22760] Another function of GAM139 is therefore inhibition of KIAA1399 (Accession XP_046685.4) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1399.

[22761] KIAA1442 (Accession XP_044921.4) is another GAM139 target gene, herein designated TARGET GENE. KIAA1442 BINDING SITE1 and KIAA1442 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by KIAA1442, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1442 BINDING SITE1 and KIAA1442 BINDING SITE2, designated SEQ ID:15532 and SEQ ID:14694 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22762] Another function of GAM139 is therefore inhibition of KIAA1442 (Accession XP_044921.4) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1442.

[22763] KIAA1509 (Accession XP_029353.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA1509 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1509, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:9747, to the nucleotide sequence of GAM139 RNA, herein designated

GAM RNA, also designated SEQ ID:327.

[22764] Another function of GAM139 is therefore inhibition of KIAA1509 (Accession XP_029353.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509.

[22765] KIAA1843 (Accession XP_030838.3) is another GAM139 target gene, herein designated TARGET GENE. KIAA1843 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1843, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1843 BINDING SITE, designated SEQ ID:14729, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22766] Another function of GAM139 is therefore inhibition of KIAA1843 (Accession XP_030838.3) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1843.

[22767] KIAA1881 (Accession XP_170901.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA1881

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1881, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1881 BINDING SITE, designated SEQ ID:12647, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22768] Another function of GAM139 is therefore inhibition of KIAA1881 (Accession XP_170901.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1881.

[22769] KIAA1920 (Accession XP_085210.1) is another GAM139 target gene, herein designated TARGET GENE. KIAA1920 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1920 BINDING SITE, designated SEQ ID:17408, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22770] Another function of GAM139 is therefore inhibition of KIAA1920 (Accession XP_085210.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1920.

[22771] Kinesin family member 1b (KIF1B, Accession NP_055889.1) is another GAM139 target gene, herein designated TARGET GENE. KIF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF1B BINDING SITE, designated SEQ ID:2509, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22772] Another function of GAM139 is therefore inhibition of Kinesin family member 1b (KIF1B, Accession NP_055889.1), a gene which motor for anterograde transport of mitochondria. has a microtubule plus end- directed motility. and therefore is associated with Charcot- marie- tooth disease, neuronal type, a. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Charcot-marie- tooth disease, neuronal type, a, and of other dis-

eases and clinical conditions associated with KIF1B.

[22773] The function of KIF1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Kringle containing transmembrane protein 2 (KREMEN2, Accession NP_663323.1) is another GAM139 target gene, herein designated TARGET GENE. KREMEN2 BINDING SITE1 and KREMEN2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by KREMEN2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KREMEN2 BINDING SITE1 and KREMEN2 BINDING SITE2, designated SEQ ID:10367 and SEQ ID:17585 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22774] Another function of GAM139 is therefore inhibition of Kringle containing transmembrane protein 2 (KREMEN2, Accession NP_663323.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KREMEN2.

[22775] Keratin associated protein 4-13 (KRTAP4-13, Accession

NP_149442.1) is another GAM139 target gene, herein designated TARGET GENE. KRTAP4-13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRTAP4-13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRTAP4-13 BINDING SITE, designated SEQ ID:2298, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22776] Another function of GAM139 is therefore inhibition of Keratin associated protein 4-13 (KRTAP4-13, Accession NP_149442.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP4-13.

[22777] Keratin associated protein 4-4 (KRTAP4-4, Accession NP_115913.1) is another GAM139 target gene, herein designated TARGET GENE. KRTAP4-4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRTAP4-4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRTAP4-4 BIND-

ING SITE, designated SEQ ID:2298, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22778] Another function of GAM139 is therefore inhibition of Keratin associated protein 4-4 (KRTAP4-4, Accession NP_115913.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP4-4.

[22779] Keratin associated protein 9-2 (KRTAP9-2, Accession NP_114167.2) is another GAM139 target gene, herein designated TARGET GENE. KRTAP9-2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRTAP9-2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRTAP9-2 BINDING SITE, designated SEQ ID:19929, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22780] Another function of GAM139 is therefore inhibition of Keratin associated protein 9-2 (KRTAP9-2, Accession NP_114167.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with KRTAP9-2.

[22781] LARP (Accession NP_056130.1) is another GAM139 target gene, herein designated TARGET GENE. LARP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LARP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LARP BINDING SITE, designated SEQ ID:12149, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22782] Another function of GAM139 is therefore inhibition of LARP (Accession NP_056130.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARP.

[22783] Lim domain binding 1 (LDB1, Accession NP_003884.1) is another GAM139 target gene, herein designated TARGET GENE. LDB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LDB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LDB1 BINDING SITE, designated SEQ ID:19322,

to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22784] Another function of GAM139 is therefore inhibition of Lim domain binding 1 (LDB1, Accession NP_003884.1), a gene which binds to the lim domain of a wide variety of lim domain- containing transcription factors. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDB1.

[22785] The function of LDB1 has been established by previous studies. For general information on LIM domain- binding factors, see CLIM1 (OMIM Ref. No. 603450). Semina et al. (1998) isolated 2 human genes encoding LIM domain-binding factors, CLIM1 and CLIM2. The 2 genes have a very high level of identity to each other and to the homologs in other species. CLIM2 encodes a 375- amino acid protein. By PCR analysis of a Genebridge 4 radiation hybrid panel, Semina et al. (1998) mapped the CLIM2 gene to 10q24- q25. Yamashita et al. (1998) mapped the mouse Lbd1 gene to a region of conserved homology in distal chromosome 19.

[22786]

[22787] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[22788] Semina, E. V.; Altherr, M. R.; Murray, J. C. : Cloning and chromosomal localization of two novel human genes encoding LIM- domain binding factors CLIM1 and CLIM2/LDB1/NL1. Mammalian Genome 9: 921- 924, 1998. ; and

[22789] Yamashita, T.; Agulnick, A. D.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Westphal, H. : Genomic structure and chromosomal localization of the mouse LIM domain-binding protein 1 g.

[22790] Further studies establishing the function and utilities of LDB1 are found in John Hopkins OMIM database record ID 603451, and in cited publications listed in Table 5, which are hereby incorporated by reference.Lectin, mannose-binding, 1 like (LMAN1L, Accession NP_078971.2) is another GAM139 target gene, herein designated TARGET GENE. LMAN1L BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LMAN1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LMAN1L BIND-

ING SITE, designated SEQ ID:11471, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22791] Another function of GAM139 is therefore inhibition of Lectin, mannose-binding, 1 like (LMAN1L, Accession NP_078971.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMAN1L.

[22792] LOC115207 (Accession NP_612453.1) is another GAM139 target gene, herein designated TARGET GENE. LOC115207 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115207, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115207 BINDING SITE, designated SEQ ID:8746, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22793] Another function of GAM139 is therefore inhibition of LOC115207 (Accession NP_612453.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115207.

[22794] LOC121456 (Accession XP_062645.2) is another GAM139 target gene, herein designated TARGET GENE. LOC121456 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC121456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC121456 BINDING SITE, designated SEQ ID:2311, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22795] Another function of GAM139 is therefore inhibition of LOC121456 (Accession XP_062645.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121456.

[22796] LOC130589 (Accession NP_620156.1) is another GAM139 target gene, herein designated TARGET GENE. LOC130589 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130589, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130589 BINDING SITE, designated SEQ ID:11004, to

the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22797] Another function of GAM139 is therefore inhibition of LOC130589 (Accession NP_620156.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130589.

[22798] LOC134111 (Accession XP_059689.2) is another GAM139 target gene, herein designated TARGET GENE. LOC134111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC134111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC134111 BINDING SITE, designated SEQ ID:7606, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22799] Another function of GAM139 is therefore inhibition of LOC134111 (Accession XP_059689.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134111.

[22800] LOC134637 (Accession XP_059727.3) is another GAM139

target gene, herein designated TARGET GENE. LOC134637 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC134637, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC134637 BINDING SITE, designated SEQ ID:12967, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22801] Another function of GAM139 is therefore inhibition of LOC134637 (Accession XP_059727.3) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134637.

[22802] LOC136015 (Accession XP_072440.1) is another GAM139 target gene, herein designated TARGET GENE. LOC136015 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC136015, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC136015 BINDING SITE, designated SEQ ID:15587, to the nucleotide sequence of GAM139 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:327.

[22803] Another function of GAM139 is therefore inhibition of LOC136015 (Accession XP_072440.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136015.

[22804] LOC142955 (Accession XP_084389.1) is another GAM139 target gene, herein designated TARGET GENE. LOC142955 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC142955, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC142955 BINDING SITE, designated SEQ ID:13772, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22805] Another function of GAM139 is therefore inhibition of LOC142955 (Accession XP_084389.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142955.

[22806] LOC143903 (Accession NP_849156.1) is another GAM139 target gene, herein designated TARGET GENE. LOC143903

BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC143903, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143903 BINDING SITE, designated SEQ ID:5549, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22807] Another function of GAM139 is therefore inhibition of LOC143903 (Accession NP_849156.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143903.

[22808] LOC143903 (Accession XP_084655.1) is another GAM139 target gene, herein designated TARGET GENE. LOC143903 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC143903, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143903 BINDING SITE, designated SEQ ID:5549, to the nucleotide sequence of

GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22809] Another function of GAM139 is therefore inhibition of LOC143903 (Accession XP_084655.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143903.

[22810] LOC145384 (Accession XP_085128.1) is another GAM139 target gene, herein designated TARGET GENE. LOC145384 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145384, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145384 BINDING SITE, designated SEQ ID:10022, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22811] Another function of GAM139 is therefore inhibition of LOC145384 (Accession XP_085128.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145384.

[22812] LOC145828 (Accession XP_096879.1) is another GAM139

target gene, herein designated TARGET GENE. LOC145828 BINDING SITE1 and LOC145828 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC145828, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145828 BINDING SITE1 and LOC145828 BINDING SITE2, designated SEQ ID:17903 and SEQ ID:13581 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22813] Another function of GAM139 is therefore inhibition of LOC145828 (Accession XP_096879.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145828.

[22814] LOC146336 (Accession XP_085421.2) is another GAM139 target gene, herein designated TARGET GENE. LOC146336 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146336, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC146336 BINDING SITE, designated SEQ ID:6404, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22815] Another function of GAM139 is therefore inhibition of LOC146336 (Accession XP_085421.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146336.

[22816] LOC146784 (Accession XP_085588.1) is another GAM139 target gene, herein designated TARGET GENE. LOC146784 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146784 BINDING SITE, designated SEQ ID:10927, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22817] Another function of GAM139 is therefore inhibition of LOC146784 (Accession XP_085588.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784.

[22818] LOC146795 (Accession XP_085593.1) is another GAM139 target gene, herein designated TARGET GENE. LOC146795 BINDING SITE1 and LOC146795 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC146795, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146795 BINDING SITE1 and LOC146795 BINDING SITE2, designated SEQ ID:4648 and SEQ ID:11983 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22819] Another function of GAM139 is therefore inhibition of LOC146795 (Accession XP_085593.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146795.

[22820] LOC146958 (Accession XP_097142.1) is another GAM139 target gene, herein designated TARGET GENE. LOC146958 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146958, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC146958 BINDING SITE, designated SEQ ID:4941, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22821] Another function of GAM139 is therefore inhibition of LOC146958 (Accession XP_097142.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146958.

[22822] LOC149837 (Accession XP_097747.1) is another GAM139 target gene, herein designated TARGET GENE. LOC149837 BINDING SITE1 and LOC149837 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC149837, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE1 and LOC149837 BINDING SITE2, designated SEQ ID:13423 and SEQ ID:16008 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22823] Another function of GAM139 is therefore inhibition of LOC149837 (Accession XP_097747.1) . Accordingly, utili-

ties of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837.

[22824] LOC150933 (Accession XP_097971.1) is another GAM139 target gene, herein designated TARGET GENE. LOC150933 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150933, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150933 BINDING SITE, designated SEQ ID:18977, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22825] Another function of GAM139 is therefore inhibition of LOC150933 (Accession XP_097971.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150933.

[22826] LOC153027 (Accession XP_041221.1) is another GAM139 target gene, herein designated TARGET GENE. LOC153027 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153027, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153027 BINDING SITE, designated SEQ ID:12321, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22827] Another function of GAM139 is therefore inhibition of LOC153027 (Accession XP_041221.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153027.

[22828] LOC154092 (Accession XP_098466.1) is another GAM139 target gene, herein designated TARGET GENE. LOC154092 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154092 BINDING SITE, designated SEQ ID:8503, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22829] Another function of GAM139 is therefore inhibition of LOC154092 (Accession XP_098466.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC154092.

[22830] LOC165622 (Accession XP_093333.6) is another GAM139 target gene, herein designated TARGET GENE. LOC165622 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC165622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC165622 BINDING SITE, designated SEQ ID:8963, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22831] Another function of GAM139 is therefore inhibition of LOC165622 (Accession XP_093333.6) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165622.

[22832] LOC168667 (Accession XP_166592.1) is another GAM139 target gene, herein designated TARGET GENE. LOC168667 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC168667, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC168667 BINDING SITE, designated SEQ ID:8774, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22833] Another function of GAM139 is therefore inhibition of LOC168667 (Accession XP_166592.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168667.

[22834] LOC200230 (Accession XP_114166.1) is another GAM139 target gene, herein designated TARGET GENE. LOC200230 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200230, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200230 BINDING SITE, designated SEQ ID:5316, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22835] Another function of GAM139 is therefore inhibition of LOC200230 (Accession XP_114166.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200230.

[22836] LOC200583 (Accession XP_114265.1) is another GAM139 target gene, herein designated TARGET GENE. LOC200583 BINDING SITE1 through LOC200583 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC200583, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200583 BINDING SITE1 through LOC200583 BINDING SITE3, designated SEQ ID:8208, SEQ ID:19716 and SEQ ID:2414 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22837] Another function of GAM139 is therefore inhibition of LOC200583 (Accession XP_114265.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200583.

[22838] LOC201181 (Accession XP_113916.1) is another GAM139 target gene, herein designated TARGET GENE. LOC201181 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC201181, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201181 BINDING SITE, designated SEQ ID:18447, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22839] Another function of GAM139 is therefore inhibition of LOC201181 (Accession XP_113916.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201181.

[22840] LOC220739 (Accession XP_167548.3) is another GAM139 target gene, herein designated TARGET GENE. LOC220739 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220739, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:15658, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22841] Another function of GAM139 is therefore inhibition of LOC220739 (Accession XP_167548.3) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC220739.

[22842] LOC221933 (Accession XP_166530.2) is another GAM139 target gene, herein designated TARGET GENE. LOC221933 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221933, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221933 BINDING SITE, designated SEQ ID:15096, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22843] Another function of GAM139 is therefore inhibition of LOC221933 (Accession XP_166530.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221933.

[22844] LOC255290 (Accession XP_170990.1) is another GAM139 target gene, herein designated TARGET GENE. LOC255290 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255290, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC255290 BINDING SITE, designated SEQ ID:1320, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22845] Another function of GAM139 is therefore inhibition of LOC255290 (Accession XP_170990.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255290.

[22846] LOC257122 (Accession XP_171239.1) is another GAM139 target gene, herein designated TARGET GENE. LOC257122 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257122 BINDING SITE, designated SEQ ID:7890, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22847] Another function of GAM139 is therefore inhibition of LOC257122 (Accession XP_171239.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257122.

[22848] LOC283033 (Accession XP_210857.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283033 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283033, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283033 BINDING SITE, designated SEQ ID:4301, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22849] Another function of GAM139 is therefore inhibition of LOC283033 (Accession XP_210857.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283033.

[22850] LOC283062 (Accession XP_210877.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283062 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283062, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283062 BINDING SITE, designated SEQ ID:9388, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22851] Another function of GAM139 is therefore inhibition of LOC283062 (Accession XP_210877.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283062.

[22852] LOC283114 (Accession XP_208042.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283114 BINDING SITE1 and LOC283114 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC283114, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283114 BINDING SITE1 and LOC283114 BINDING SITE2, designated SEQ ID:14489 and SEQ ID:17069 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22853] Another function of GAM139 is therefore inhibition of LOC283114 (Accession XP_208042.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC283114.

[22854] LOC283198 (Accession XP_208550.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283198 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283198, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283198 BINDING SITE, designated SEQ ID:12328, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22855] Another function of GAM139 is therefore inhibition of LOC283198 (Accession XP_208550.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283198.

[22856] LOC283270 (Accession XP_210956.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283270 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283270, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC283270 BINDING SITE, designated SEQ ID:17363, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22857] Another function of GAM139 is therefore inhibition of LOC283270 (Accession XP_210956.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283270.

[22858] LOC283364 (Accession XP_211003.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283364 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283364, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283364 BINDING SITE, designated SEQ ID:18990, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22859] Another function of GAM139 is therefore inhibition of LOC283364 (Accession XP_211003.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC283364.

[22860] LOC283386 (Accession XP_208656.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283386 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283386, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283386 BINDING SITE, designated SEQ ID:3288, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22861] Another function of GAM139 is therefore inhibition of LOC283386 (Accession XP_208656.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283386.

[22862] LOC283435 (Accession XP_211035.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283435 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283435 BINDING SITE, designated SEQ ID:15472, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22863] Another function of GAM139 is therefore inhibition of LOC283435 (Accession XP_211035.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283435.

[22864] LOC283582 (Accession XP_211119.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283582 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283582, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283582 BINDING SITE, designated SEQ ID:6596, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22865] Another function of GAM139 is therefore inhibition of LOC283582 (Accession XP_211119.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283582.

[22866] LOC283637 (Accession XP_211134.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283637 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283637, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283637 BINDING SITE, designated SEQ ID:1923, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22867] Another function of GAM139 is therefore inhibition of LOC283637 (Accession XP_211134.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283637.

[22868] LOC283723 (Accession XP_211176.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283723 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283723, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283723 BINDING SITE, designated SEQ ID:14435, to

the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22869] Another function of GAM139 is therefore inhibition of LOC283723 (Accession XP_211176.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283723.

[22870] LOC283789 (Accession XP_208120.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283789 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283789, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283789 BINDING SITE, designated SEQ ID:15242, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22871] Another function of GAM139 is therefore inhibition of LOC283789 (Accession XP_208120.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283789.

[22872] LOC283807 (Accession XP_211207.1) is another GAM139

target gene, herein designated TARGET GENE. LOC283807 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283807, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283807 BINDING SITE, designated SEQ ID:8994, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22873] Another function of GAM139 is therefore inhibition of LOC283807 (Accession XP_211207.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283807.

[22874] LOC283852 (Accession XP_211228.1) is another GAM139 target gene, herein designated TARGET GENE. LOC283852 BINDING SITE1 through LOC283852 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC283852, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283852 BINDING SITE1 through LOC283852 BINDING SITE3, des-

ignated SEQ ID:12663, SEQ ID:12405 and SEQ ID:16600 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22875] Another function of GAM139 is therefore inhibition of LOC283852 (Accession XP_211228.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283852.

[22876] LOC283911 (Accession XP_211259.2) is another GAM139 target gene, herein designated TARGET GENE. LOC283911 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283911 BINDING SITE, designated SEQ ID:18967, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22877] Another function of GAM139 is therefore inhibition of LOC283911 (Accession XP_211259.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283911.

[22878] LOC284015 (Accession XP_210324.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284015 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284015, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284015 BINDING SITE, designated SEQ ID:12620, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22879] Another function of GAM139 is therefore inhibition of LOC284015 (Accession XP_210324.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284015.

[22880] LOC284037 (Accession XP_208153.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284037 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284037, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284037 BINDING SITE, designated SEQ ID:15556, to

the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22881] Another function of GAM139 is therefore inhibition of LOC284037 (Accession XP_208153.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284037.

[22882] LOC284130 (Accession XP_209031.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284130 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284130, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284130 BINDING SITE, designated SEQ ID:8262, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22883] Another function of GAM139 is therefore inhibition of LOC284130 (Accession XP_209031.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284130.

[22884] LOC284167 (Accession XP_208171.1) is another GAM139

target gene, herein designated TARGET GENE. LOC284167 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284167, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284167 BINDING SITE, designated SEQ ID:20016, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22885] Another function of GAM139 is therefore inhibition of LOC284167 (Accession XP_208171.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284167.

[22886] LOC284186 (Accession XP_209060.2) is another GAM139 target gene, herein designated TARGET GENE. LOC284186 BINDING SITE1 and LOC284186 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284186, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284186 BINDING SITE1 and LOC284186 BINDING SITE2, designated SEQ ID:6257

and SEQ ID:9676 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22887] Another function of GAM139 is therefore inhibition of LOC284186 (Accession XP_209060.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284186.

[22888] LOC284231 (Accession XP_208184.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284231 BINDING SITE1 and LOC284231 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284231, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284231 BINDING SITE1 and LOC284231 BINDING SITE2, designated SEQ ID:5381 and SEQ ID:10934 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22889] Another function of GAM139 is therefore inhibition of LOC284231 (Accession XP_208184.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284231.

[22890] LOC284434 (Accession XP_211460.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284434 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284434, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284434 BINDING SITE, designated SEQ ID:8357, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22891] Another function of GAM139 is therefore inhibition of LOC284434 (Accession XP_211460.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284434.

[22892] LOC284615 (Accession XP_211553.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284615 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284615, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284615 BINDING SITE, designated SEQ ID:9828, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22893] Another function of GAM139 is therefore inhibition of LOC284615 (Accession XP_211553.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284615.

[22894] LOC284687 (Accession XP_211587.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284687 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284687, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284687 BINDING SITE, designated SEQ ID:2504, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22895] Another function of GAM139 is therefore inhibition of LOC284687 (Accession XP_211587.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284687.

[22896] LOC284719 (Accession XP_211601.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284719 BINDING SITE1 and LOC284719 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284719, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284719 BINDING SITE1 and LOC284719 BINDING SITE2, designated SEQ ID:15624 and SEQ ID:1476 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22897] Another function of GAM139 is therefore inhibition of LOC284719 (Accession XP_211601.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284719.

[22898] LOC284739 (Accession XP_211609.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284739 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284739, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284739 BINDING SITE, designated SEQ ID:13956, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22899] Another function of GAM139 is therefore inhibition of LOC284739 (Accession XP_211609.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284739.

[22900] LOC284874 (Accession XP_209394.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284874 BINDING SITE1 and LOC284874 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284874, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284874 BINDING SITE1 and LOC284874 BINDING SITE2, designated SEQ ID:19517 and SEQ ID:4696 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22901] Another function of GAM139 is therefore inhibition of

LOC284874 (Accession XP_209394.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284874.

[22902] LOC284922 (Accession XP_209409.1) is another GAM139 target gene, herein designated TARGET GENE. LOC284922 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284922 BINDING SITE, designated SEQ ID:19183, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22903] Another function of GAM139 is therefore inhibition of LOC284922 (Accession XP_209409.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284922.

[22904] LOC285036 (Accession XP_210798.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285036 BINDING SITE1 and LOC285036 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by LOC285036, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285036 BINDING SITE1 and LOC285036 BINDING SITE2, designated SEQ ID:5723 and SEQ ID:16269 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22905] Another function of GAM139 is therefore inhibition of LOC285036 (Accession XP_210798.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285036.

[22906] LOC285084 (Accession XP_211758.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285084 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285084, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285084 BINDING SITE, designated SEQ ID:5269, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22907] Another function of GAM139 is therefore inhibition of LOC285084 (Accession XP_211758.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285084.

[22908] LOC285103 (Accession XP_211766.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285103 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285103, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285103 BINDING SITE, designated SEQ ID:16353, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22909] Another function of GAM139 is therefore inhibition of LOC285103 (Accession XP_211766.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285103.

[22910] LOC285112 (Accession XP_209475.3) is another GAM139 target gene, herein designated TARGET GENE. LOC285112 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC285112, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285112 BINDING SITE, designated SEQ ID:8814, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22911] Another function of GAM139 is therefore inhibition of LOC285112 (Accession XP_209475.3) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285112.

[22912] LOC285152 (Accession XP_211783.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285152 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285152, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285152 BINDING SITE, designated SEQ ID:11345, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22913] Another function of GAM139 is therefore inhibition of

LOC285152 (Accession XP_211783.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285152.

[22914] LOC285592 (Accession XP_209669.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285592 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285592, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285592 BINDING SITE, designated SEQ ID:2468, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22915] Another function of GAM139 is therefore inhibition of LOC285592 (Accession XP_209669.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285592.

[22916] LOC285624 (Accession XP_209685.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285624 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285624, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285624 BINDING SITE, designated SEQ ID:12598, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22917] Another function of GAM139 is therefore inhibition of LOC285624 (Accession XP_209685.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285624.

[22918] LOC285625 (Accession XP_209684.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285625 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285625, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285625 BINDING SITE, designated SEQ ID:19717, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22919] Another function of GAM139 is therefore inhibition of LOC285625 (Accession XP_209684.1) . Accordingly, utili-

ties of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285625.

[22920] LOC285651 (Accession XP_211974.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285651 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285651, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285651 BINDING SITE, designated SEQ ID:4365, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22921] Another function of GAM139 is therefore inhibition of LOC285651 (Accession XP_211974.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285651.

[22922] LOC285748 (Accession XP_209738.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285748 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285748, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285748 BINDING SITE, designated SEQ ID:17272, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22923] Another function of GAM139 is therefore inhibition of LOC285748 (Accession XP_209738.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285748.

[22924] LOC285801 (Accession XP_209767.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285801 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285801, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285801 BINDING SITE, designated SEQ ID:15998, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22925] Another function of GAM139 is therefore inhibition of LOC285801 (Accession XP_209767.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285801.

[22926] LOC285928 (Accession XP_212087.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285928 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285928, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285928 BINDING SITE, designated SEQ ID:12928, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22927] Another function of GAM139 is therefore inhibition of LOC285928 (Accession XP_212087.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285928.

[22928] LOC285968 (Accession XP_212107.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285968 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285968, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285968 BINDING SITE, designated SEQ ID:17285, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22929] Another function of GAM139 is therefore inhibition of LOC285968 (Accession XP_212107.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285968.

[22930] LOC285992 (Accession XP_212126.1) is another GAM139 target gene, herein designated TARGET GENE. LOC285992 BINDING SITE1 and LOC285992 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285992, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285992 BINDING SITE1 and LOC285992 BINDING SITE2, designated SEQ ID:7305 and SEQ ID:1701 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22931] Another function of GAM139 is therefore inhibition of LOC285992 (Accession XP_212126.1) . Accordingly, utili-

ties of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285992.

[22932] LOC286078 (Accession XP_212163.1) is another GAM139 target gene, herein designated TARGET GENE. LOC286078 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286078 BINDING SITE, designated SEQ ID:943, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22933] Another function of GAM139 is therefore inhibition of LOC286078 (Accession XP_212163.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286078.

[22934] LOC286218 (Accession XP_212235.1) is another GAM139 target gene, herein designated TARGET GENE. LOC286218 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286218, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286218 BINDING SITE, designated SEQ ID:4239, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22935] Another function of GAM139 is therefore inhibition of LOC286218 (Accession XP_212235.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286218.

[22936] LOC286520 (Accession XP_212330.2) is another GAM139 target gene, herein designated TARGET GENE. LOC286520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286520 BINDING SITE, designated SEQ ID:9346, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22937] Another function of GAM139 is therefore inhibition of LOC286520 (Accession XP_212330.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC286520.

[22938] LOC338558 (Accession XP_290465.1) is another GAM139 target gene, herein designated TARGET GENE. LOC338558 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338558, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338558 BINDING SITE, designated SEQ ID:858, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22939] Another function of GAM139 is therefore inhibition of LOC338558 (Accession XP_290465.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338558.

[22940] LOC339122 (Accession XP_290714.1) is another GAM139 target gene, herein designated TARGET GENE. LOC339122 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC339122 BINDING SITE, designated SEQ ID:15658, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22941] Another function of GAM139 is therefore inhibition of LOC339122 (Accession XP_290714.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339122.

[22942] LOC339166 (Accession XP_294837.1) is another GAM139 target gene, herein designated TARGET GENE. LOC339166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339166 BINDING SITE, designated SEQ ID:12464, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22943] Another function of GAM139 is therefore inhibition of LOC339166 (Accession XP_294837.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC339166.

[22944] LOC339172 (Accession XP_290740.1) is another GAM139 target gene, herein designated TARGET GENE. LOC339172 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339172, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339172 BINDING SITE, designated SEQ ID:2113, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22945] Another function of GAM139 is therefore inhibition of LOC339172 (Accession XP_290740.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339172.

[22946] LOC339230 (Accession XP_290771.1) is another GAM139 target gene, herein designated TARGET GENE. LOC339230 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339230, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC339230 BINDING SITE, designated SEQ ID:12801, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22947] Another function of GAM139 is therefore inhibition of LOC339230 (Accession XP_290771.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339230.

[22948] LOC339305 (Accession XP_297112.1) is another GAM139 target gene, herein designated TARGET GENE. LOC339305 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339305, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339305 BINDING SITE, designated SEQ ID:6942, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22949] Another function of GAM139 is therefore inhibition of LOC339305 (Accession XP_297112.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339305.

[22950] LOC339914 (Accession XP_295099.1) is another GAM139 target gene, herein designated TARGET GENE. LOC339914 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339914, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339914 BINDING SITE, designated SEQ ID:19354, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22951] Another function of GAM139 is therefore inhibition of LOC339914 (Accession XP_295099.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339914.

[22952] LOC339942 (Accession XP_295107.1) is another GAM139 target gene, herein designated TARGET GENE. LOC339942 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339942, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339942 BINDING SITE, designated SEQ ID:13382, to

the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22953] Another function of GAM139 is therefore inhibition of LOC339942 (Accession XP_295107.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339942.

[22954] LOC340223 (Accession XP_290385.1) is another GAM139 target gene, herein designated TARGET GENE. LOC340223 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340223 BINDING SITE, designated SEQ ID:5180, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22955] Another function of GAM139 is therefore inhibition of LOC340223 (Accession XP_290385.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340223.

[22956] LOC340239 (Accession XP_295192.1) is another GAM139

target gene, herein designated TARGET GENE. LOC340239 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340239, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340239 BINDING SITE, designated SEQ ID:3128, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22957] Another function of GAM139 is therefore inhibition of LOC340239 (Accession XP_295192.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340239.

[22958] LOC340240 (Accession XP_295189.1) is another GAM139 target gene, herein designated TARGET GENE. LOC340240 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340240, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340240 BINDING SITE, designated SEQ ID:3128, to the nucleotide sequence of GAM139 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:327.

[22959] Another function of GAM139 is therefore inhibition of LOC340240 (Accession XP_295189.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340240.

[22960] LOC340243 (Accession XP_290389.1) is another GAM139 target gene, herein designated TARGET GENE. LOC340243 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340243, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340243 BINDING SITE, designated SEQ ID:1105, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22961] Another function of GAM139 is therefore inhibition of LOC340243 (Accession XP_290389.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340243.

[22962] LOC340390 (Accession XP_291269.1) is another GAM139 target gene, herein designated TARGET GENE. LOC340390

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340390, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340390 BINDING SITE, designated SEQ ID:8372, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22963] Another function of GAM139 is therefore inhibition of LOC340390 (Accession XP_291269.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340390.

[22964] LOC340581 (Accession XP_295270.1) is another GAM139 target gene, herein designated TARGET GENE. LOC340581 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340581, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340581 BINDING SITE, designated SEQ ID:17000, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22965] Another function of GAM139 is therefore inhibition of LOC340581 (Accession XP_295270.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340581.

[22966] LOC342195 (Accession XP_292413.1) is another GAM139 target gene, herein designated TARGET GENE. LOC342195 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC342195, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342195 BINDING SITE, designated SEQ ID:12881, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22967] Another function of GAM139 is therefore inhibition of LOC342195 (Accession XP_292413.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342195.

[22968] LOC342346 (Accession XP_296817.2) is another GAM139 target gene, herein designated TARGET GENE. LOC342346 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC342346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342346 BINDING SITE, designated SEQ ID:16656, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22969] Another function of GAM139 is therefore inhibition of LOC342346 (Accession XP_296817.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342346.

[22970] LOC342487 (Accession XP_296893.1) is another GAM139 target gene, herein designated TARGET GENE. LOC342487 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC342487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342487 BINDING SITE, designated SEQ ID:1758, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22971] Another function of GAM139 is therefore inhibition of

LOC342487 (Accession XP_296893.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342487.

[22972] LOC344563 (Accession XP_297716.1) is another GAM139 target gene, herein designated TARGET GENE. LOC344563 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC344563, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC344563 BINDING SITE, designated SEQ ID:13365, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22973] Another function of GAM139 is therefore inhibition of LOC344563 (Accession XP_297716.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC344563.

[22974] LOC344992 (Accession XP_298469.1) is another GAM139 target gene, herein designated TARGET GENE. LOC344992 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC344992, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC344992 BINDING SITE, designated SEQ ID:17064, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22975] Another function of GAM139 is therefore inhibition of LOC344992 (Accession XP_298469.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC344992.

[22976] LOC347959 (Accession XP_302635.1) is another GAM139 target gene, herein designated TARGET GENE. LOC347959 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347959, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347959 BINDING SITE, designated SEQ ID:9115, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22977] Another function of GAM139 is therefore inhibition of LOC347959 (Accession XP_302635.1) . Accordingly, utili-

ties of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347959.

[22978] LOC348118 (Accession XP_300289.1) is another GAM139 target gene, herein designated TARGET GENE. LOC348118 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348118, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348118 BINDING SITE, designated SEQ ID:15242, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22979] Another function of GAM139 is therefore inhibition of LOC348118 (Accession XP_300289.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348118.

[22980] LOC348488 (Accession XP_300352.1) is another GAM139 target gene, herein designated TARGET GENE. LOC348488 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348488, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348488 BINDING SITE, designated SEQ ID:18044, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22981] Another function of GAM139 is therefore inhibition of LOC348488 (Accession XP_300352.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348488.

[22982] LOC348509 (Accession XP_300770.1) is another GAM139 target gene, herein designated TARGET GENE. LOC348509 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348509, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348509 BINDING SITE, designated SEQ ID:8733, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22983] Another function of GAM139 is therefore inhibition of LOC348509 (Accession XP_300770.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348509.

[22984] LOC348549 (Accession XP_211637.1) is another GAM139 target gene, herein designated TARGET GENE. LOC348549 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348549, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348549 BINDING SITE, designated SEQ ID:19450, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22985] Another function of GAM139 is therefore inhibition of LOC348549 (Accession XP_211637.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348549.

[22986] LOC348552 (Accession XP_209362.1) is another GAM139 target gene, herein designated TARGET GENE. LOC348552 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348552, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC348552 BINDING SITE, designated SEQ ID:13423, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22987] Another function of GAM139 is therefore inhibition of LOC348552 (Accession XP_209362.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348552.

[22988] LOC348599 (Accession XP_300383.1) is another GAM139 target gene, herein designated TARGET GENE. LOC348599 BINDING SITE1 and LOC348599 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348599, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348599 BINDING SITE1 and LOC348599 BINDING SITE2, designated SEQ ID:19517 and SEQ ID:4696 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22989] Another function of GAM139 is therefore inhibition of LOC348599 (Accession XP_300383.1) . Accordingly, utili-

ties of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348599.

[22990] LOC348909 (Accession XP_300875.1) is another GAM139 target gene, herein designated TARGET GENE. LOC348909 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348909 BINDING SITE, designated SEQ ID:14383, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22991] Another function of GAM139 is therefore inhibition of LOC348909 (Accession XP_300875.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348909.

[22992] LOC349061 (Accession XP_300923.1) is another GAM139 target gene, herein designated TARGET GENE. LOC349061 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349061, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349061 BINDING SITE, designated SEQ ID:17272, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22993] Another function of GAM139 is therefore inhibition of LOC349061 (Accession XP_300923.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349061.

[22994] LOC349066 (Accession XP_300926.1) is another GAM139 target gene, herein designated TARGET GENE. LOC349066 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349066, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349066 BINDING SITE, designated SEQ ID:17272, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22995] Another function of GAM139 is therefore inhibition of LOC349066 (Accession XP_300926.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC349066.

[22996] LOC349092 (Accession XP_302959.1) is another GAM139 target gene, herein designated TARGET GENE. LOC349092 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349092 BINDING SITE, designated SEQ ID:6029, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22997] Another function of GAM139 is therefore inhibition of LOC349092 (Accession XP_302959.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349092.

[22998] LOC349151 (Accession XP_302967.1) is another GAM139 target gene, herein designated TARGET GENE. LOC349151 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349151, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC349151 BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[22999] Another function of GAM139 is therefore inhibition of LOC349151 (Accession XP_302967.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349151.

[23000] LOC349710 (Accession XP_303482.1) is another GAM139 target gene, herein designated TARGET GENE. LOC349710 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349710, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349710 BINDING SITE, designated SEQ ID:18662, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23001] Another function of GAM139 is therefore inhibition of LOC349710 (Accession XP_303482.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC349710.

[23002] LOC90120 (Accession XP_291299.1) is another GAM139 target gene, herein designated TARGET GENE. LOC90120 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90120, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90120 BINDING SITE, designated SEQ ID:3855, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23003] Another function of GAM139 is therefore inhibition of LOC90120 (Accession XP_291299.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90120.

[23004] LOC90906 (Accession XP_034809.1) is another GAM139 target gene, herein designated TARGET GENE. LOC90906 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC90906 BINDING SITE, designated SEQ ID:7354, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23005] Another function of GAM139 is therefore inhibition of LOC90906 (Accession XP_034809.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906.

[23006] LOC91661 (Accession NP_612381.1) is another GAM139 target gene, herein designated TARGET GENE. LOC91661 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91661, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:19944, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23007] Another function of GAM139 is therefore inhibition of LOC91661 (Accession NP_612381.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661.

[23008] LOC91947 (Accession XP_041721.2) is another GAM139 target gene, herein designated TARGET GENE. LOC91947 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91947, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91947 BINDING SITE, designated SEQ ID:13563, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23009] Another function of GAM139 is therefore inhibition of LOC91947 (Accession XP_041721.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91947.

[23010] LOC91974 (Accession XP_041974.2) is another GAM139 target gene, herein designated TARGET GENE. LOC91974 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91974, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91974 BINDING SITE, designated SEQ ID:706, to the

nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23011] Another function of GAM139 is therefore inhibition of LOC91974 (Accession XP_041974.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91974.

[23012] LOC93273 (Accession XP_050184.1) is another GAM139 target gene, herein designated TARGET GENE. LOC93273 BINDING SITE1 and LOC93273 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC93273, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93273 BINDING SITE1 and LOC93273 BINDING SITE2, designated SEQ ID:18095 and SEQ ID:2415 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23013] Another function of GAM139 is therefore inhibition of LOC93273 (Accession XP_050184.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC93273.

[23014] LW-1 (Accession NP_057237.1) is another GAM139 target gene, herein designated TARGET GENE. LW-1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LW-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LW-1 BINDING SITE, designated SEQ ID:11543, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23015] Another function of GAM139 is therefore inhibition of LW-1 (Accession NP_057237.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LW-1.

[23016] Microtubule-associated protein, rp/eb family, member 1 (MAPRE1, Accession NP_036457.1) is another GAM139 target gene, herein designated TARGET GENE. MAPRE1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAPRE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MAPRE1 BINDING SITE, designated SEQ ID:19788, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23017] Another function of GAM139 is therefore inhibition of Microtubule-associated protein, rp/eb family, member 1 (MAPRE1, Accession NP_036457.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE1.

[23018] Microtubule-associated protein, rp/eb family, member 3 (MAPRE3, Accession NP_036458.2) is another GAM139 target gene, herein designated TARGET GENE. MAPRE3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAPRE3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:12646, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23019] Another function of GAM139 is therefore inhibition of Microtubule-associated protein, rp/eb family, member 3 (MAPRE3, Accession NP_036458.2), a gene which interact

with cytoplasmic microtubules,and with the adenomatous polyposis coli. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3.

[23020] The function of MAPRE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM117.1.Methyl-cpg binding domain protein 1 (MBD1, Accession NP_056723.2) is another GAM139 target gene, herein designated TARGET GENE. MBD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MBD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBD1 BINDING SITE, designated SEQ ID:14525, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23021] Another function of GAM139 is therefore inhibition of Methyl-cpg binding domain protein 1 (MBD1, Accession NP_056723.2), a gene which bind specifically to methylated DNA via a methyl- CpG- binding domain (MBD). Accordingly, utilities of GAM139 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with MBD1.

[23022] The function of MBD1 has been established by previous studies. Attempts to understand how DNA methylation prevents transcription have centered on 2 alternative mechanisms: direct interference of site- specific methylation with the binding of essential transcription factors, and indirect interference of promoter- proximal methylation with transcription via a protein that binds to methylated DNA. Methyl- CpG- binding protein- 1 (MECP1) binds to a variety of methylated sequences in vitro, provided they contain at least 12 symmetrically methylated CpGs. MECP1 has been detected in crude nuclear extracts. Boyes and Bird (1991) and Levine et al. (1991) presented evidence suggesting that the MECP1 protein is a mediator of repression. Methylation of cytosines within the sequence CpG is essential for mouse development and has been linked to transcriptional suppression in vertebrate systems. Methyl- CpG- binding proteins MECP1 and MECP2 (OMIM Ref. No. 300005) bind preferentially to methylated DNA and can inhibit transcription. The rat Mecp2 gene was cloned by Nan et al. (1993) and its methyl- CpG- binding domain (MBD) defined. By search-

ing DNA sequence databases with the MBD sequence, Cross et al. (1997) identified a human cDNA with potential to encode an MBD- like region. Sequencing of the complete cDNA revealed that the open reading frame also encodes 2 cysteine- rich domains that were found in animal DNA methyltransferases (see OMIM Ref. No. DNMT; 126375) and in the mammalian HRX protein, also known as MLL and ALL- 1 (OMIM Ref. No. 159555). They designated the protein PCM1 for 'protein containing MBD.' Expressed in bacteria, it showed specific binding to methylated DNA. PCM1 also repressed transcription in vitro in a methylation- dependent manner. A polyclonal antibody raised against the protein was able to bind the native MECP1 complex from HeLa cells, indicating that PCM1 is a component of mammalian MECP1. Using PCR on a hybrid panel and FISH, Hendrich et al. (1999) mapped the MBD1 gene to chromosome 18q21, 2.1 cM distal to MBD2 (OMIM Ref. No. 603547). They mapped the murine gene to chromosome 18.

[23023]

[23024] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23025] Boyes, J.; Bird, A. : DNA methylation inhibits transcription indirectly via a methyl- CpG binding protein. Cell 64: 1123- 1134, 1991. ; and

[23026] Levine, A.; Cantoni, G. L.; Razin, A. : Inhibition of promoter activity by methylation: possible involvement of protein mediators. Proc. Nat. Acad. Sci. 88: 6515- 6518, 1991.

[23027] Further studies establishing the function and utilities of MBD1 are found in John Hopkins OMIM database record ID 156535, and in cited publications listed in Table 5, which are hereby incorporated by reference.Methyl-cpg binding domain protein 1 (MBD1, Accession NP_056669.1) is another GAM139 target gene, herein designated TARGET GENE. MBD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MBD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBD1 BINDING SITE, designated SEQ ID:14525, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23028] Another function of GAM139 is therefore inhibition of

Methyl-cpg binding domain protein 1 (MBD1, Accession NP_056669.1), a gene which bind specifically to methylated DNA via a methyl- CpG- binding domain (MBD). Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD1.

[23029] The function of MBD1 has been established by previous studies. Attempts to understand how DNA methylation prevents transcription have centered on 2 alternative mechanisms: direct interference of site- specific methylation with the binding of essential transcription factors, and indirect interference of promoter- proximal methylation with transcription via a protein that binds to methylated DNA. Methyl- CpG- binding protein- 1 (MECP1) binds to a variety of methylated sequences in vitro, provided they contain at least 12 symmetrically methylated CpGs. MECP1 has been detected in crude nuclear extracts. Boyes and Bird (1991) and Levine et al. (1991) presented evidence suggesting that the MECP1 protein is a mediator of repression. Methylation of cytosines within the sequence CpG is essential for mouse development and has been linked to transcriptional suppression in vertebrate systems. Methyl- CpG- binding proteins MECP1 and

MECP2 (OMIM Ref. No. 300005) bind preferentially to methylated DNA and can inhibit transcription. The rat Mecp2 gene was cloned by Nan et al. (1993) and its methyl- CpG- binding domain (MBD) defined. By searching DNA sequence databases with the MBD sequence, Cross et al. (1997) identified a human cDNA with potential to encode an MBD- like region. Sequencing of the complete cDNA revealed that the open reading frame also encodes 2 cysteine- rich domains that were found in animal DNA methyltransferases (see OMIM Ref. No. DNMT; 126375) and in the mammalian HRX protein, also known as MLL and ALL- 1 (OMIM Ref. No. 159555). They designated the protein PCM1 for 'protein containing MBD.' Expressed in bacteria, it showed specific binding to methylated DNA. PCM1 also repressed transcription in vitro in a methylation- dependent manner. A polyclonal antibody raised against the protein was able to bind the native MECP1 complex from HeLa cells, indicating that PCM1 is a component of mammalian MECP1. Using PCR on a hybrid panel and FISH, Hendrich et al. (1999) mapped the MBD1 gene to chromosome 18q21, 2.1 cM distal to MBD2 (OMIM Ref. No. 603547). They mapped the murine gene to chromosome 18.

[23030]

[23031] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23032] Boyes, J.; Bird, A. : DNA methylation inhibits transcription indirectly via a methyl- CpG binding protein. Cell 64: 1123- 1134, 1991. ; and

[23033] Levine, A.; Cantoni, G. L.; Razin, A. : Inhibition of promoter activity by methylation: possible involvement of protein mediators. Proc. Nat. Acad. Sci. 88: 6515- 6518, 1991.

[23034] Further studies establishing the function and utilities of MBD1 are found in John Hopkins OMIM database record ID 156535, and in cited publications listed in Table 5, which are hereby incorporated by reference.Methyl-cpg binding domain protein 1 (MBD1, Accession NP_002375.1) is another GAM139 target gene, herein designated TARGET GENE. MBD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MBD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBD1 BINDING SITE,

designated SEQ ID:14525, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23035] Another function of GAM139 is therefore inhibition of Methyl-cpg binding domain protein 1 (MBD1, Accession NP_002375.1), a gene which bind specifically to methylated DNA via a methyl- CpG- binding domain (MBD). Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD1.

[23036] The function of MBD1 has been established by previous studies. Attempts to understand how DNA methylation prevents transcription have centered on 2 alternative mechanisms: direct interference of site- specific methylation with the binding of essential transcription factors, and indirect interference of promoter- proximal methylation with transcription via a protein that binds to methylated DNA. Methyl- CpG- binding protein- 1 (MECP1) binds to a variety of methylated sequences in vitro, provided they contain at least 12 symmetrically methylated CpGs. MECP1 has been detected in crude nuclear extracts. Boyes and Bird (1991) and Levine et al. (1991) presented evidence suggesting that the MECP1 protein is a mediator

of repression. Methylation of cytosines within the sequence CpG is essential for mouse development and has been linked to transcriptional suppression in vertebrate systems. Methyl- CpG- binding proteins MECP1 and MECP2 (OMIM Ref. No. 300005) bind preferentially to methylated DNA and can inhibit transcription. The rat Mecp2 gene was cloned by Nan et al. (1993) and its methyl- CpG- binding domain (MBD) defined. By searching DNA sequence databases with the MBD sequence, Cross et al. (1997) identified a human cDNA with potential to encode an MBD- like region. Sequencing of the complete cDNA revealed that the open reading frame also encodes 2 cysteine- rich domains that were found in animal DNA methyltransferases (see OMIM Ref. No. DNMT; 126375) and in the mammalian HRX protein, also known as MLL and ALL- 1 (OMIM Ref. No. 159555). They designated the protein PCM1 for 'protein containing MBD.' Expressed in bacteria, it showed specific binding to methylated DNA. PCM1 also repressed transcription in vitro in a methylation- dependent manner. A polyclonal antibody raised against the protein was able to bind the native MECP1 complex from HeLa cells, indicating that PCM1 is a component of mammalian MECP1. Using PCR on a hybrid

panel and FISH, Hendrich et al. (1999) mapped the MBD1 gene to chromosome 18q21, 2.1 cM distal to MBD2 (OMIM Ref. No. 603547). They mapped the murine gene to chromosome 18.

[23037]

[23048] Further studies establishing the function and utilities of MBD1 are found in John Hopkins OMIM database record ID 156535, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC10715

(Accession NP_077301.4) is another GAM139 target gene, herein designated TARGET GENE. MGC10715 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:17990, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23049] Another function of GAM139 is therefore inhibition of MGC10715 (Accession NP_077301.4) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715.

[23050] MGC12518 (Accession NP_291026.1) is another GAM139 target gene, herein designated TARGET GENE. MGC12518 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC12518, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12518 BINDING SITE, designated SEQ ID:18236, to

the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23051] Another function of GAM139 is therefore inhibition of MGC12518 (Accession NP_291026.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12518.

[23052] MGC13071 (Accession NP_116078.2) is another GAM139 target gene, herein designated TARGET GENE. MGC13071 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13071 BINDING SITE, designated SEQ ID:12254, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23053] Another function of GAM139 is therefore inhibition of MGC13071 (Accession NP_116078.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13071.

[23054] MGC15396 (Accession NP_443087.1) is another GAM139

target gene, herein designated TARGET GENE. MGC15396 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15396, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15396 BINDING SITE, designated SEQ ID:11393, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23055] Another function of GAM139 is therefore inhibition of MGC15396 (Accession NP_443087.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15396.

[23056] MGC16142 (Accession NP_116152.1) is another GAM139 target gene, herein designated TARGET GENE. MGC16142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC16142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16142 BINDING SITE, designated SEQ ID:6403, to the nucleotide sequence of GAM139 RNA, herein designated

GAM RNA, also designated SEQ ID:327.

[23057] Another function of GAM139 is therefore inhibition of MGC16142 (Accession NP_116152.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16142.

[23058] MGC16638 (Accession NP_777593.1) is another GAM139 target gene, herein designated TARGET GENE. MGC16638 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC16638, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16638 BINDING SITE, designated SEQ ID:18557, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23059] Another function of GAM139 is therefore inhibition of MGC16638 (Accession NP_777593.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16638.

[23060] MGC17330 (Accession NP_443112.1) is another GAM139 target gene, herein designated TARGET GENE. MGC17330

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC17330, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC17330 BINDING SITE, designated SEQ ID:13961, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23061] Another function of GAM139 is therefore inhibition of MGC17330 (Accession NP_443112.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17330.

[23062] MGC24995 (Accession NP_714914.1) is another GAM139 target gene, herein designated TARGET GENE. MGC24995 BINDING SITE1 and MGC24995 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MGC24995, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC24995 BINDING SITE1 and MGC24995 BINDING SITE2, designated SEQ ID:16446 and SEQ ID:2593 respectively, to the nucleotide sequence

of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23063] Another function of GAM139 is therefore inhibition of MGC24995 (Accession NP_714914.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC24995.

[23064] MGC30156 (Accession NP_689852.1) is another GAM139 target gene, herein designated TARGET GENE. MGC30156 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC30156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC30156 BINDING SITE, designated SEQ ID:14918, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23065] Another function of GAM139 is therefore inhibition of MGC30156 (Accession NP_689852.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC30156.

[23066] MGC3222 (Accession NP_077310.1) is another GAM139

target gene, herein designated TARGET GENE. MGC3222 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3222, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3222 BINDING SITE, designated SEQ ID:3878, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23067] Another function of GAM139 is therefore inhibition of MGC3222 (Accession NP_077310.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3222.

[23068] MGC3248 (Accession NP_115875.1) is another GAM139 target gene, herein designated TARGET GENE. MGC3248 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3248, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:10750, to the nucleotide sequence of GAM139 RNA, herein designated

GAM RNA, also designated SEQ ID:327.

[23069] Another function of GAM139 is therefore inhibition of MGC3248 (Accession NP_115875.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248.

[23070] MGC35023 (Accession NP_787073.1) is another GAM139 target gene, herein designated TARGET GENE. MGC35023 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MGC35023, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35023 BINDING SITE, designated SEQ ID:16655, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23071] Another function of GAM139 is therefore inhibition of MGC35023 (Accession NP_787073.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35023.

[23072] MGC35023 (Accession XP_086685.1) is another GAM139

target gene, herein designated TARGET GENE. MGC35023 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MGC35023, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35023 BINDING SITE, designated SEQ ID:16655, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23073] Another function of GAM139 is therefore inhibition of MGC35023 (Accession XP_086685.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35023.

[23074] MGC39520 (Accession NP_699195.1) is another GAM139 target gene, herein designated TARGET GENE. MGC39520 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC39520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39520 BINDING SITE, designated SEQ ID:7717, to the

nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23075] Another function of GAM139 is therefore inhibition of MGC39520 (Accession NP_699195.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39520.

[23076] MGC4504 (Accession NP_077016.1) is another GAM139 target gene, herein designated TARGET GENE. MGC4504 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4504, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4504 BINDING SITE, designated SEQ ID:10242, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23077] Another function of GAM139 is therefore inhibition of MGC4504 (Accession NP_077016.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4504.

[23078] MGC48986 (Accession NP_787077.1) is another GAM139

target gene, herein designated TARGET GENE. MGC48986 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC48986, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC48986 BINDING SITE, designated SEQ ID:11203, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23079] Another function of GAM139 is therefore inhibition of MGC48986 (Accession NP_787077.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC48986.

[23080] MGRN1 (Accession XP_048119.4) is another GAM139 target gene, herein designated TARGET GENE. MGRN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGRN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGRN1 BINDING SITE, designated SEQ ID:14631, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA,

also designated SEQ ID:327.

[23081] Another function of GAM139 is therefore inhibition of MGRN1 (Accession XP_048119.4) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGRN1.

[23082] Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_009220.1) is another GAM139 target gene, herein designated TARGET GENE. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE, designated SEQ ID:2426, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23083] Another function of GAM139 is therefore inhibition of Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_009220.1), a gene which is thermolysin- like specificity. and therefore is associated with Acute lymphocytic leukemia. Accordingly, utilities of GAM139 include diag-

nosis, prevention and treatment of Acute lymphocytic leukemia, and of other diseases and clinical conditions associated with MME.

[23084] The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_000893.1) is another GAM139 target gene, herein designated TARGET GENE. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE, designated SEQ ID:2426, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23085] Another function of GAM139 is therefore inhibition of Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_000893.1), a gene which is thermolysin- like specificity. and therefore is associated with Acute lymphocytic

leukemia. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Acute lymphocytic leukemia, and of other diseases and clinical conditions associated with MME.

[23086] The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_009218.1) is another GAM139 target gene, herein designated TARGET GENE. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE, designated SEQ ID:2426, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23087] Another function of GAM139 is therefore inhibition of Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_009218.1), a gene which is thermolysin- like speci-

ficity. and therefore is associated with Acute lymphocytic leukemia. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Acute lymphocytic leukemia, and of other diseases and clinical conditions associated with MME.

[23088] The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_009219.1) is another GAM139 target gene, herein designated TARGET GENE. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE, designated SEQ ID:2426, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23089] Another function of GAM139 is therefore inhibition of Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession

NP_009219.1), a gene which is thermolysin- like specificity. and therefore is associated with Acute lymphocytic leukemia. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Acute lymphocytic leukemia, and of other diseases and clinical conditions associated with MME.

[23090] The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Max binding protein (MNT, Accession NP_064706.1) is another GAM139 target gene, herein designated TARGET GENE. MNT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MNT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:2618, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23091] Another function of GAM139 is therefore inhibition of Max binding protein (MNT, Accession NP_064706.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with MNT.

[23092] MOST2 (Accession NP_064635.1) is another GAM139 target gene, herein designated TARGET GENE. MOST2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MOST2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:4257, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23093] Another function of GAM139 is therefore inhibition of MOST2 (Accession NP_064635.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2.

[23094] Membrane protein, palmitoylated 2 (maguk p55 subfamily member 2) (MPP2, Accession NP_005365.2) is another GAM139 target gene, herein designated TARGET GENE. MPP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MPP2 BINDING SITE, designated SEQ ID:5243, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23095] Another function of GAM139 is therefore inhibition of Membrane protein, palmitoylated 2 (maguk p55 subfamily member 2) (MPP2, Accession NP_005365.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2.

[23096] MSP (Accession NP_114435.1) is another GAM139 target gene, herein designated TARGET GENE. MSP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MSP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MSP BINDING SITE, designated SEQ ID:13067, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23097] Another function of GAM139 is therefore inhibition of MSP (Accession NP_114435.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSP.

[23098] Mucin and cadherin-like (MUCDHL, Accession NP_112555.1) is another GAM139 target gene, herein designated TARGET GENE. MUCDHL BINDING SITE1 and MUCDHL BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MUCDHL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MUCDHL BINDING SITE1 and MUCDHL BINDING SITE2, designated SEQ ID:1008 and SEQ ID:8074 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23099] Another function of GAM139 is therefore inhibition of Mucin and cadherin-like (MUCDHL, Accession NP_112555.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUCDHL.

[23100] Myeloid differentiation primary response gene (88) (MYD88, Accession NP_002459.1) is another GAM139 target gene, herein designated TARGET GENE. MYD88 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYD88, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYD88 BINDING SITE, designated SEQ ID:13413, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23101] Another function of GAM139 is therefore inhibition of Myeloid differentiation primary response gene (88) (MYD88, Accession NP_002459.1), a gene which is involved in the toll- like receptor and il- 1 receptor signaling pathway in the innate immune response. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYD88.

[23102] The function of MYD88 has been established by previous studies. The myeloid differentiation (MyD) marker MyD88 was first characterized during a study of the early genetic responses of murine myeloid cells to various differentiation and growth inhibitory stimuli (Lord et al., 1990). Myeloid differentiation primary response genes are activated in M1 myeloleukemic cells in response to interleukin- 6 (IL6; 147620), which induces both growth arrest and terminal differentiation. Hardiman et al. (1997) de-

scribed the cloning and gene structure of the mouse MyD88 gene. The complete coding sequence spans 5 exons, with the first exon encoding a complete 'death domain' similar to the intracellular segment of TNF receptor-1 (OMIM Ref. No. 191190). Zoo blot analysis demonstrated that it is an evolutionarily conserved gene. Northern blot analysis revealed widespread expression of the gene in many adult mouse tissues, and RT- PCR detected MyD88 mRNA in T- and B- cell lines and differentiating embryonic stem cells. The broad expression pattern demonstrated that mouse Myd88 expression is not restricted to cells of myeloid lineage as was originally believed.

[23103] Animal model experiments lend further support to the function of MYD88. Adachi et al. (1998) observed that mice with a targeted disruption of the Myd88 gene were unable to respond to IL1 (e.g., 147760), as determined by defective T- cell proliferation and the production of cytokines. Likewise, Myd88- deficient mice were unable to produce gamma- interferon (IFNG; 147570) and mediate natural killer cell activity in response to IL18 (OMIM Ref. No. 600953). NFKB activation in response to IL1 or IL18 was also impaired. These results indicated that MYD88 is

a critical component in the IL1R and IL18R (OMIM Ref. No. 604494) signaling cascades. Kawai et al. (1999) extended these studies to show that responses to lipopolysaccharide, mediated by TLR4 and CD14 (OMIM Ref. No. 158120), were lost or delayed in Myd88- deficient mice, establishing that MYD88 is part of the TLR signaling cascade as well, acting just upstream of IRAK.

[23104] It is appreciated that the abovementioned animal model for MYD88 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[23105] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23106] Adachi, O.; Kawai, T.; Takeda, K.; Matsumoto, M.; Tsutsui, H.; Sakagami, M.; Nakanishi, K.; Akira, S. : Targeted disruption of the MyD88 gene results in loss of IL- 1- and IL-18- mediated function. Immunity 143- 150, 1998. ; and

[23107] Hardiman, G.; Jenkins, N. A.; Copeland, N. G.; Gilbert, D. J.; Garcia, D. K.; Naylor, S. L.; Kastelein, R. A.; Bazan, J. F. : Genetic structure and chromosomal mapping of MyD88. Genomics.

[23108] Further studies establishing the function and utilities of

MYD88 are found in John Hopkins OMIM database record ID 602170, and in cited publications listed in Table 5, which are hereby incorporated by reference.NESH (Accession NP_057512.1) is another GAM139 target gene, herein designated TARGET GENE. NESH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NESH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NESH BINDING SITE, designated SEQ ID:6776, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23109] Another function of GAM139 is therefore inhibition of NESH (Accession NP_057512.1), a gene which plays a role in cell growth signalling. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NESH.

[23110] The function of NESH has been established by previous studies. By screening a hepatocellular cDNA library using PCR with degenerate primers corresponding to p53 (OMIM Ref. No. 191170)/p73 (OMIM Ref. No. 601990) exon domains, followed by probing a placenta cDNA library,

Miyazaki et al. (2000) obtained a cDNA encoding an SH3-containing protein they designated NESH (new molecule including SH3). SH3 domains contain about 50 amino acids that bind to proline- rich sequences and often play a role in cell growth signalling. Sequence analysis predicted that the 366- amino acid NESH protein, which is most homologous to SSH3BP1 (OMIM Ref. No. 603050), has a central serine- rich region followed by a proline- rich region and a C- terminal SH3 domain. RT- PCR analysis detected variable expression of NESH in all tissues tested. Miyazaki et al. (2000) suggested that the similarity of NESH to SSH3BP1, an EPS8 (OMIM Ref. No. 600206)- binding protein, indicates that its SH3 domain may interact with other proteins in signal transduction. GENE FUNCTION Using the yeast 2- hybrid system, Matsuda et al. (2001) identified TARSH (OMIM Ref. No. 606279) as a binding partner of NESH.

[23111]

[23112] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23113] Matsuda, S.; Iriyama, C.; Yokozaki, S.; Ichigotani, Y.; Shirafuji, N.; Yamaki, K.; Hayakawa, T.; Hamaguchi, M. :

Cloning and sequencing of a novel human gene that encodes a putative target protein of Nesh- SH3. J. Hum. Genet. 46: 483- 486, 2001. ; and

[23114] Miyazaki, K.; Matsuda, S.; Ichigotani, Y.; Takenouchi, Y.; Hayashi, K.; Fukuda, Y.; Nimura, Y.; Hamaguchi, M. : Isolation and characterization of a novel human gene (NESH) which encode.

[23115] Further studies establishing the function and utilities of NESH are found in John Hopkins OMIM database record ID 606363, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nfs1 nitrogen fixation 1 (s. cerevisiae) (NFS1, Accession NP_066923.2) is another GAM139 target gene, herein designated TARGET GENE. NFS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NFS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFS1 BINDING SITE, designated SEQ ID:14605, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23116] Another function of GAM139 is therefore inhibition of Nfs1 nitrogen fixation 1 (s. cerevisiae) (NFS1, Accession

NP_066923.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFS1.

[23117] Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) is another GAM139 target gene, herein designated TARGET GENE. NIPSNAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NIPSNAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NIPSNAP1 BINDING SITE, designated SEQ ID:16274, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23118] Another function of GAM139 is therefore inhibition of Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIPSNAP1.

[23119] Aminopeptidase-like 1 (NPEPL1, Accession NP_078939.2) is another GAM139 target gene, herein designated TARGET GENE. NPEPL1 BINDING SITE1 and NPEPL1 BINDING SITE2 are target binding sites found in untranslated re-

gions of mRNA encoded by NPEPL1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPEPL1 BINDING SITE1 and NPEPL1 BINDING SITE2, designated SEQ ID:7568 and SEQ ID:2446 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23120] Another function of GAM139 is therefore inhibition of Aminopeptidase-like 1 (NPEPL1, Accession NP_078939.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPL1.

[23121] Aminopeptidase puromycin sensitive (NPEPPS, Accession NP_006301.2) is another GAM139 target gene, herein designated TARGET GENE. NPEPPS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPEPPS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:2285, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23122] Another function of GAM139 is therefore inhibition of Aminopeptidase puromycin sensitive (NPEPPS, Accession NP_006301.2), a gene which is puromycin- sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPPS.

[23123] The function of NPEPPS has been established by previous studies. Tobler et al. (1997) cloned PSA from a human fetal brain cDNA library using the mouse PSA cDNA as probe. They established that translation is initiated at the second of 2 possible start codons, resulting in a deduced 875- amino acid protein with a molecular mass of 99 kD by SDS- PAGE. PSA contains a zinc- binding motif conserved among gluzincin aminopeptidases and shares 98% sequence identity with the mouse protein. Northern blot analysis detected ubiquitous expression of a 4.8- kb transcript, with highest expression in brain. By in situ hybridization of adult human brain sections, expression was localized to the perikaryon of neurons of the cortex and cerebellum. Using immunofluorescence localization of transfected HeLa cells, Tobler et al. (1997) found that PSA localizes to the perinuclear cytoplasm and shows a fila-

mentous staining pattern. Bauer et al. (2001) cloned PSA cDNA from a human skeletal muscle library. Northern blot analysis detected major and minor transcripts of 4.8 and 4.2 kb, respectively. Huber et al. (1999) determined that PSA is identical to the matalloprotease MP100 that was originally isolated as a beta- secretase candidate from human brain by Schonlein et al. (1994). Huber et al. (1999) were able to colocalize and coimmunoprecipitate PSA with beta- amyloid precursor protein (OMIM Ref. No. 104760); however, PSA did not increase production of the amyloid- beta peptide in cotransfected cells. By RT- PCR, but not by Northern blot analysis, Bauer et al. (2001) found that PSA was upregulated in human leukemic cells following vitamin D stimulation.

[23124]

[23125] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23126] Huber, G.; Thompson, A.; Gruninger, F.; Mechler, H.; Hochstrasser, R.; Hauri, H.- P.; Malherbe, P. : cDNA cloning and molecular characterization of human brain metalloprotease MP100: a beta- secretase candidate? J. Neurochem. 72: 1215- 1223, 1999. ; and

[23127] Tobler, A. R.; Constam, D. B.; Schmitt- Graff, A.; Malipiero, U.; Schlapbach, R.; Fontana, A. : Cloning of the human puromycin- sensitive aminopeptidase and evidence for expression in neu.

[23128] Further studies establishing the function and utilities of NPEPPS are found in John Hopkins OMIM database record ID 606793, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nucleoporin 133kda (NUP133, Accession NP_060700.2) is another GAM139 target gene, herein designated TARGET GENE. NUP133 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUP133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP133 BINDING SITE, designated SEQ ID:2638, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23129] Another function of GAM139 is therefore inhibition of Nucleoporin 133kda (NUP133, Accession NP_060700.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP133.

[23130] Opioid receptor, delta 1 (OPRD1, Accession NP_000902.2) is another GAM139 target gene, herein designated TARGET GENE. OPRD1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by OPRD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPRD1 BINDING SITE, designated SEQ ID:15006, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23131] Another function of GAM139 is therefore inhibition of Opioid receptor, delta 1 (OPRD1, Accession NP_000902.2), a gene which inhibits neurotransmitter release by reducing calcium ion currents and increasing potassium ion conductance. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPRD1.

[23132] The function of OPRD1 has been established by previous studies. Bzdega et al. (1993) cloned the delta opiate receptor gene from a mouse neuroblastoma- rat glioma hybrid cell line. The clone they isolated was apparently identical to those reported by others (e.g., Evans et al., 1992).

They found full- length transcripts of the gene in mouse brain but in no other tissues examined. Within the brain the gene was expressed at low levels in many regions, but transcripts were found in particularly large amounts in the anterior pituitary and pineal glands. Since these tissues are located outside the blood- brain barrier, opioid peptides easily can reach receptors in these areas from the blood. The gene, which was present in single copy and was symbolized Nbor for 'neuroblastoma opiate receptor,' was mapped to the distal region of mouse chromosome 4 by linkage studies. It was found to lie between Lck and Gnb- 1. The human homologs of these 2 genes, LCK (OMIM Ref. No. 153390) and GNB1 (OMIM Ref. No. 139380), are located on human chromosome 1p; thus, the human gene for delta- opiate receptor is probably in this region. (GNB1 is mapped to 1pter- p31.2; LCK is mapped to 1p35- p32.) Kaufman et al. (1994) reported linkage relationships of Oprd1 on mouse chromosome 4 and stated that the human homolog had been mapped to 1p by in situ hybridization. Befort et al. (1994) assigned the OPRD1 gene to 1p36.1- p34.3 by isotopic in situ hybridization and the homologous gene to mouse chromosome 4 by the same method.

[23133] Animal model experiments lend further support to the function of OPRD1. Filliol et al. (2000) generated Oprd1-deficient mice and compared the behavioral responses of mice lacking Oprd1, Oprm, and Oprk1 in several models of anxiety and depression. Their data showed no detectable phenotype in Oprk1 - /- mutants, suggesting that kappa- receptors do not have a role in this aspect of opioid function. Opposing phenotypes in Oprm - /- and Oprd1 - /- mutants contrasted with the classic notion of similar activities of mu- and delta- receptors. Anxiogenic- and depressive- like responses in Oprd1 - /- mice indicated that delta- receptor activity contributes to improvement of mood states. Filliol et al. (2000) concluded that the Oprd1- encoded receptor, which has been proposed to be a promising target for the clinical management of pain, should also be considered in the treatment of drug addiction and other mood- related disorders.

[23134] It is appreciated that the abovementioned animal model for OPRD1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[23135] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[23136] Bzdega, T.; Chin, H.; Kim, H.; Jung, H. H.; Kozak, C. A.; Klee, W. A. : Regional expression and chromosomal localization of the delta opiate receptor gene. Proc. Nat. Acad. Sci. 90: 9305- 9309, 1993. ; and

[23137] Filliol, D.; Ghozland, S.; Chluba, J.; Martin, M.; Matthes, H. W. D.; Simonin, F.; Befort, K.; Gaveriaux- Ruff, C.; Dierich, A.; LeMeur, M.; Valverde, O.; Maldonado, R.; Kieffer, B. L. :.

[23138] Further studies establishing the function and utilities of OPRD1 are found in John Hopkins OMIM database record ID 165195, and in cited publications listed in Table 5, which are hereby incorporated by reference.P5326 (Accession NP_113638.1) is another GAM139 target gene, herein designated TARGET GENE. P5326 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P5326, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P5326 BINDING SITE, designated SEQ ID:20183, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23139] Another function of GAM139 is therefore inhibition of P5326 (Accession NP_113638.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5326.

[23140] P21(cdkn1a)-activated kinase 6 (PAK6, Accession NP_064553.1) is another GAM139 target gene, herein designated TARGET GENE. PAK6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAK6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:718, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23141] Another function of GAM139 is therefore inhibition of P21(cdkn1a)-activated kinase 6 (PAK6, Accession NP_064553.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6.

[23142] Programmed cell death 1 (PDCD1, Accession NP_005009.1) is another GAM139 target gene, herein designated TARGET GENE. PDCD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by PDCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDCD1 BINDING SITE, designated SEQ ID:9612, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23143] Another function of GAM139 is therefore inhibition of Programmed cell death 1 (PDCD1, Accession NP_005009.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCD1.

[23144] Phosphatidylethanolamine n-methyltransferase (PEMT, Accession NP_009100.2) is another GAM139 target gene, herein designated TARGET GENE. PEMT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PEMT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEMT BINDING SITE, designated SEQ ID:3100, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23145] Another function of GAM139 is therefore inhibition of

Phosphatidylethanolamine n-methyltransferase (PEMT, Accession NP_009100.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEMT.

[23146] Phosphatidylethanolamine n-methyltransferase (PEMT, Accession NP_680478.1) is another GAM139 target gene, herein designated TARGET GENE. PEMT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PEMT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEMT BINDING SITE, designated SEQ ID:3100, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23147] Another function of GAM139 is therefore inhibition of Phosphatidylethanolamine n-methyltransferase (PEMT, Accession NP_680478.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEMT.

[23148] Phosphatidylethanolamine n-methyltransferase (PEMT, Accession NP_680477.1) is another GAM139 target gene, herein designated TARGET GENE. PEMT BINDING SITE is a

target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PEMT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEMT BINDING SITE, designated SEQ ID:3100, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23149] Another function of GAM139 is therefore inhibition of Phosphatidylethanolamine n-methyltransferase (PEMT, Accession NP_680477.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEMT.

[23150] 6-phosphogluconolactonase (PGLS, Accession NP_036220.1) is another GAM139 target gene, herein designated TARGET GENE. PGLS BINDING SITE1 and PGLS BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PGLS, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PGLS BINDING SITE1 and PGLS BINDING SITE2, designated SEQ ID:11405 and SEQ ID:16901 respectively, to the nucleotide se-

quence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23151] Another function of GAM139 is therefore inhibition of 6-phosphogluconolactonase (PGLS, Accession NP_036220.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGLS.

[23152] Putative homeodomain transcription factor 2 (PHTF2, Accession NP_065165.1) is another GAM139 target gene, herein designated TARGET GENE. PHTF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PHTF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHTF2 BINDING SITE, designated SEQ ID:13764, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23153] Another function of GAM139 is therefore inhibition of Putative homeodomain transcription factor 2 (PHTF2, Accession NP_065165.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHTF2.

[23154] Phosphatidylinositol (4,5) bisphosphate 5-phosphatase, a (PIB5PA, Accession NP_055237.1) is another GAM139 target gene, herein designated TARGET GENE. PIB5PA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIB5PA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIB5PA BINDING SITE, designated SEQ ID:19904, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23155] Another function of GAM139 is therefore inhibition of Phosphatidylinositol (4,5) bisphosphate 5-phosphatase, a (PIB5PA, Accession NP_055237.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIB5PA.

[23156] Phosphatidylinositol 4-kinase, catalytic, beta polypeptide (PIK4CB, Accession NP_002642.1) is another GAM139 target gene, herein designated TARGET GENE. PIK4CB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIK4CB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of PIK4CB BINDING SITE, designated SEQ ID:7503, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23157] Another function of GAM139 is therefore inhibition of Phosphatidylinositol 4-kinase, catalytic, beta polypeptide (PIK4CB, Accession NP_002642.1), a gene which phosphorylates the 4- OH position of phosphatidyl inositol. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK4CB.

[23158] The function of PIK4CB has been established by previous studies. By degenerate PCR, library screening, and 5-prime- RACE, Meyers and Cantley (1997) cloned human placenta and heart cDNAs encoding a novel PI 4- kinase, which they called PI4K- beta. The predicted 801- amino acid PI4K- beta protein contains an N- terminal lipid kinase unique domain, which is shared by members of both the PI 3- kinase (e.g., 171834) and PI 4- kinase families, and a C- terminal catalytic domain, which defines this protein as a member of a much larger protein/lipid kinase family. PI4K- beta shares significant amino acid sequence similarity with yeast PIK1. Western blot analysis of mam-

malian cell lysates using an antibody against PI4K- beta detected a 110- kD protein. Northern blot analysis showed that PI4K- beta is ubiquitously expressed as an approximately 4- kb transcript, with highest expression in heart, pancreas, and skeletal muscle. Biochemical analyses indicated that PI4K- beta is a type III enzyme that is sensitive to wortmannin. Meyers and Cantley (1997) stated that PI4K- beta is likely the wortmannin- sensitive PI 4- kinase described by Nakanishi et al. (1995) that is responsible for regulating the synthesis of agonist- sensitive pools of polyphosphoinositides. Saito et al. (1997) isolated a PI 4-kinase cDNA from a human adult brain cDNA library. The sequence of the cDNA was highly identical to that of the PI4K- beta cDNA (Meyers and Cantley, 1997), and Saito et al. (1997) suggested that they represented alternative products of the same gene. Suzuki et al. (1997) cloned 3 forms of cDNAs encoding human PIK4CB, which they named NPIK for 'novel putative phosphatidylinositol kinase;' 2 of the cDNAs had different 5- prime open reading frame sequences, and the third contained a 45- bp insertion within the coding sequence. The authors suggested that these cDNAs resulted from alternative transcription initiation sites and alternative splicing. By Northern blot

analysis, they detected 4.8- and 3.6- kb transcripts whose relative levels varied in different tissues. Using the green fluorescent protein system, they demonstrated that PIK4CB is localized in the cytoplasm.

[23159]

[23160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23161] Saito, T.; Seki, N.; Ishii, H.; Ohira, M.; Hayashi, A.; Kozuma, S.; Hori, T. : Complementary DNA cloning and chromosomal mapping of a novel phosphatidylinositol kinase gene. DNA Res. 4: 301- 305, 1997. ; and

[23162] Suzuki, K.; Hirano, H.; Okutomi, K.; Suzuki, M.; Kuga, Y.; Fujiwara, T.; Kanemoto, N.; Isono, K.; Horie, M. : Identification and characterization of a novel human phosphatidylinositol 4.

[23163] Further studies establishing the function and utilities of PIK4CB are found in John Hopkins OMIM database record ID 602758, and in cited publications listed in Table 5, which are hereby incorporated by reference.Perilipin (PLIN, Accession NP_002657.1) is another GAM139 target gene, herein designated TARGET GENE. PLIN BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by PLIN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLIN BINDING SITE, designated SEQ ID:5398, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23164] Another function of GAM139 is therefore inhibition of Perilipin (PLIN, Accession NP_002657.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLIN.

[23165] PNPLA1 (Accession NP_775947.1) is another GAM139 target gene, herein designated TARGET GENE. PNPLA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PNPLA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PNPLA1 BINDING SITE, designated SEQ ID:15703, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23166] Another function of GAM139 is therefore inhibition of PN-

PLA1 (Accession NP_775947.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNPLA1.

[23167] PP1665 (Accession NP_110419.3) is another GAM139 target gene, herein designated TARGET GENE. PP1665 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PP1665, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, designated SEQ ID:463, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23168] Another function of GAM139 is therefore inhibition of PP1665 (Accession NP_110419.3) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1665.

[23169] Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_055152.1) is another GAM139 target gene, herein designated TARGET GENE. PPIL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPIL2, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPIL2 BINDING SITE, designated SEQ ID:4077, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23170] Another function of GAM139 is therefore inhibition of Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_055152.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL2.

[23171] Periplakin (PPL, Accession NP_002696.2) is another GAM139 target gene, herein designated TARGET GENE. PPL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPL BINDING SITE, designated SEQ ID:3926, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23172] Another function of GAM139 is therefore inhibition of Periplakin (PPL, Accession NP_002696.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PPL.

[23173] Protein phosphatase 3 (formerly 2b), regulatory subunit b, 19kda, beta isoform (calcineurin b, type ii) (PPP3R2, Accession NP_671709.1) is another GAM139 target gene, herein designated TARGET GENE. PPP3R2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP3R2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP3R2 BINDING SITE, designated SEQ ID:14639, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23174] Another function of GAM139 is therefore inhibition of Protein phosphatase 3 (formerly 2b), regulatory subunit b, 19kda, beta isoform (calcineurin b, type ii) (PPP3R2, Accession NP_671709.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3R2.

[23175] PRO1580 (Accession NP_060972.2) is another GAM139 target gene, herein designated TARGET GENE. PRO1580 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by PRO1580, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1580 BINDING SITE, designated SEQ ID:1379, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23176] Another function of GAM139 is therefore inhibition of PRO1580 (Accession NP_060972.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1580.

[23177] Prostein (Accession NP_149093.1) is another GAM139 target gene, herein designated TARGET GENE. Prostein BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Prostein, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Prostein BINDING SITE, designated SEQ ID:16057, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23178] Another function of GAM139 is therefore inhibition of

Prostein (Accession NP_149093.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Prostein.

[23179] Proline-rich gla (g-carboxyglutamic acid) polypeptide 1 (PRRG1, Accession NP_000941.1) is another GAM139 target gene, herein designated TARGET GENE. PRRG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRRG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:18891, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23180] Another function of GAM139 is therefore inhibition of Proline-rich gla (g-carboxyglutamic acid) polypeptide 1 (PRRG1, Accession NP_000941.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1.

[23181] Prostate stem cell antigen (PSCA, Accession NP_005663.1) is another GAM139 target gene, herein designated TARGET GENE. PSCA BINDING SITE1 and PSCA BINDING SITE2

are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PSCA, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSCA BINDING SITE1 and PSCA BINDING SITE2, designated SEQ ID:3633 and SEQ ID:6007 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23182] Another function of GAM139 is therefore inhibition of Prostate stem cell antigen (PSCA, Accession NP_005663.1). Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSCA.

[23183] Proline-serine-threonine phosphatase interacting protein 1 (PSTPIP1, Accession NP_003969.2) is another GAM139 target gene, herein designated TARGET GENE. PSTPIP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PSTPIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSTPIP1 BINDING SITE, designated SEQ ID:12408, to the

nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23184] Another function of GAM139 is therefore inhibition of Proline-serine-threonine phosphatase interacting protein 1 (PSTPIP1, Accession NP_003969.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSTPIP1.

[23185] Rab11-FIP3 (Accession NP_055515.1) is another GAM139 target gene, herein designated TARGET GENE. Rab11-FIP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Rab11-FIP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Rab11-FIP3 BINDING SITE, designated SEQ ID:6083, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23186] Another function of GAM139 is therefore inhibition of Rab11-FIP3 (Accession NP_055515.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP3.

[23187] Rab6 interacting protein 1 (RAB6IP1, Accession XP_290550.1) is another GAM139 target gene, herein designated TARGET GENE. RAB6IP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB6IP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB6IP1 BINDING SITE, designated SEQ ID:6028, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23188] Another function of GAM139 is therefore inhibition of Rab6 interacting protein 1 (RAB6IP1, Accession XP_290550.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6IP1.

[23189] Rab7, member ras oncogene family-like 1 (RAB7L1, Accession NP_003920.1) is another GAM139 target gene, herein designated TARGET GENE. RAB7L1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB7L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of RAB7L1 BINDING SITE, designated SEQ ID:6106, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23190] Another function of GAM139 is therefore inhibition of Rab7, member ras oncogene family-like 1 (RAB7L1, Accession NP_003920.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB7L1.

[23191] RHPN2 (Accession NP_149094.2) is another GAM139 target gene, herein designated TARGET GENE. RHPN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RHPN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RHPN2 BINDING SITE, designated SEQ ID:11438, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23192] Another function of GAM139 is therefore inhibition of RHPN2 (Accession NP_149094.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHPN2.

[23193] RIS1 (Accession NP_056259.1) is another GAM139 target gene, herein designated TARGET GENE. RIS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RIS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RIS1 BINDING SITE, designated SEQ ID:13282, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23194] Another function of GAM139 is therefore inhibition of RIS1 (Accession NP_056259.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIS1.

[23195] RNF144 (Accession NP_055561.1) is another GAM139 target gene, herein designated TARGET GENE. RNF144 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF144, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF144 BINDING SITE, designated SEQ ID:1841, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA,

also designated SEQ ID:327.

[23196] Another function of GAM139 is therefore inhibition of RNF144 (Accession NP_055561.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF144.

[23197] Ribosomal protein l13 (RPL13, Accession NP_000968.2) is another GAM139 target gene, herein designated TARGET GENE. RPL13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RPL13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPL13 BINDING SITE, designated SEQ ID:4471, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23198] Another function of GAM139 is therefore inhibition of Ribosomal protein l13 (RPL13, Accession NP_000968.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL13.

[23199] Ribosomal protein l13 (RPL13, Accession NP_150254.1) is

another GAM139 target gene, herein designated TARGET GENE. RPL13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RPL13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPL13 BINDING SITE, designated SEQ ID:4471, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23200] Another function of GAM139 is therefore inhibition of Ribosomal protein l13 (RPL13, Accession NP_150254.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL13.

[23201] Ribosomal protein s18 (RPS18, Accession NP_072045.1) is another GAM139 target gene, herein designated TARGET GENE. RPS18 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RPS18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPS18 BINDING SITE, designated SEQ

ID:14400, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23202] Another function of GAM139 is therefore inhibition of Ribosomal protein s18 (RPS18, Accession NP_072045.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS18.

[23203] Run and fyve domain containing 2 (RUFY2, Accession NP_060457.2) is another GAM139 target gene, herein designated TARGET GENE. RUFY2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RUFY2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RUFY2 BINDING SITE, designated SEQ ID:15232, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23204] Another function of GAM139 is therefore inhibition of Run and fyve domain containing 2 (RUFY2, Accession NP_060457.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUFY2.

[23205] Runt-related transcription factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NP_001745.2) is another GAM139 target gene, herein designated TARGET GENE. RUNX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RUNX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:16964, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23206] Another function of GAM139 is therefore inhibition of Runt-related transcription factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NP_001745.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1.

[23207] Seryl-trna synthetase 2 (SARS2, Accession NP_060297.1) is another GAM139 target gene, herein designated TARGET GENE. SARS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SARS2, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SARS2 BINDING SITE, designated SEQ ID:10983, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23208] Another function of GAM139 is therefore inhibition of Seryl-trna synthetase 2 (SARS2, Accession NP_060297.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARS2.

[23209] Squamous cell carcinoma antigen recognised by t cells 3 (SART3, Accession NP_055521.1) is another GAM139 target gene, herein designated TARGET GENE. SART3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SART3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SART3 BINDING SITE, designated SEQ ID:14542, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23210] Another function of GAM139 is therefore inhibition of

Squamous cell carcinoma antigen recognised by t cells 3 (SART3, Accession NP_055521.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SART3.

[23211] SCMH1 (Accession NP_036368.1) is another GAM139 target gene, herein designated TARGET GENE. SCMH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCMH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCMH1 BINDING SITE, designated SEQ ID:18639, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23212] Another function of GAM139 is therefore inhibition of SCMH1 (Accession NP_036368.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCMH1.

[23213] Sco cytochrome oxidase deficient homolog 2 (yeast) (SCO2, Accession NP_005129.1) is another GAM139 target gene, herein designated TARGET GENE. SCO2 BINDING SITE1 and SCO2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SCO2,

corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCO2 BINDING SITE1 and SCO2 BINDING SITE2, designated SEQ ID:18670 and SEQ ID:3615 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23214] Another function of GAM139 is therefore inhibition of Sco cytochrome oxidase deficient homolog 2 (yeast) (SCO2, Accession NP_005129.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCO2.

[23215] SDNSF (Accession NP_644808.1) is another GAM139 target gene, herein designated TARGET GENE. SDNSF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDNSF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDNSF BINDING SITE, designated SEQ ID:13351, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23216] Another function of GAM139 is therefore inhibition of

SDNSF (Accession NP_644808.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDNSF.

[23217] Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_620710.1) is another GAM139 target gene, herein designated TARGET GENE. SMARCD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE, designated SEQ ID:10765, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23218] Another function of GAM139 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_620710.1), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1.

[23219] The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM42.1.Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_003067.2) is another GAM139 target gene, herein designated TARGET GENE. SMARCD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE, designated SEQ ID:10765, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23220] Another function of GAM139 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_003067.2), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1.

[23221] The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM42.1.Synuclein, gamma (breast cancer-specific protein 1) (SNCG, Accession NP_003078.1) is another GAM139 target gene, herein designated TARGET GENE. SNCG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNCG BINDING SITE, designated SEQ ID:5579, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23222] Another function of GAM139 is therefore inhibition of Synuclein, gamma (breast cancer-specific protein 1) (SNCG, Accession NP_003078.1), a gene which plays a role in neurofilament network integrity and therefore may be associated with Breast cancer. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Breast cancer., and of other diseases and clinical conditions associated with SNCG.

[23223] The function of SNCG has been established by previous

studies. The synuclein gene family comprises genes that are highly conserved between species. Lavedan et al. (1998) identified and characterized a novel member of the human synuclein gene family, gamma- synuclein (SNCG). The SNCG gene contains 5 exons and encodes a 127-amino acid protein that is highly homologous to alpha-synuclein (SNCA; 163890) and beta- synuclein (SNCB; 602569). Northern blot analysis showed that the gene is principally expressed in the brain, particularly in the substantia nigra. Through a survey of an EST database, Lavedan et al. (1998) found that the SNCG gene may also be overexpressed in ovarian tumors. Ji et al. (1997) used a high- throughput direct- differential cDNA sequencing approach to identify genes differentially expressed in normal breast as compared with breast cancer. Of many putative differentially expressed genes, a breast cancer-specific gene, BCSG1, which was expressed in high abundance in a breast cancer cDNA library but scarcely at all in a normal breast cDNA library, was identified as a putative breast cancer marker. In situ hybridization analysis demonstrated stage- specific BCSG1 expression as follows: BCSG1 was undetectable in normal or benign breast lesions, showing partial expression in ductal carcinoma in

situ, but was expressed at an extremely high level in advanced infiltrating breast cancer. The predicted amino acid sequence of the BCSG1 gene product had a significant homology to the nonamyloid beta protein fragment of Alzheimer disease amyloid protein (OMIM Ref. No. 163890). BCSG1 overexpression may indicate breast cancer malignant progression from benign or in situ carcinoma.

[23224]

[23225] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23226] Ji, H.; Liu, Y. E.; Jia, T.; Wang, M.; Liu, J.; Xiao, G.; Joseph, B. K.; Rosen, C.; Shi, Y. E. : Identification of a breast cancer- specific gene, BCSG1, by direct differential cDNA sequencing. Cancer Res. 57: 759- 764, 1997. ; and

[23227] Lavedan, C.; Buchholtz, S.; Auburger, G.; Albin, R. L.; Athanassiadou, A.; Blancato, J.; Burguera, J. A.; Ferrell, R. E.; Kostic, V.; Leroy, E.; Leube, B.; Mota- Vieira, L.; and 9 others.

[23228] Further studies establishing the function and utilities of SNCG are found in John Hopkins OMIM database record ID 602998, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Syntaphilin (SNPH, Accession NP_055538.1) is another GAM139 target gene, herein designated TARGET GENE. SNPH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:2804, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23229] Another function of GAM139 is therefore inhibition of Syntaphilin (SNPH, Accession NP_055538.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH.

[23230] SSH2 (Accession XP_290798.1) is another GAM139 target gene, herein designated TARGET GENE. SSH2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SSH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of SSH2 BINDING SITE, designated SEQ ID:15268, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23231] Another function of GAM139 is therefore inhibition of SSH2 (Accession XP_290798.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2.

[23232] Stromal interaction molecule 1 (STIM1, Accession NP_003147.2) is another GAM139 target gene, herein designated TARGET GENE. STIM1 BINDING SITE1 through STIM1 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by STIM1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STIM1 BINDING SITE1 through STIM1 BINDING SITE3, designated SEQ ID:7760, SEQ ID:19353 and SEQ ID:13882 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23233] Another function of GAM139 is therefore inhibition of Stromal interaction molecule 1 (STIM1, Accession NP_003147.2), a gene which is very strongly similar to murine Stim1 and may be a transmembrane stromal cell

protein. and therefore may be associated with The beck- with- wiedemann syndrome and wilms tumor. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of The beckwith- wiedemann syndrome and wilms tumor, and of other diseases and clinical conditions associated with STIM1.

[23234] The function of STIM1 has been established by previous studies. Using sequences identified by database searching with a transcript from human chromosome 11p15.5, Parker et al. (1996) screened placental and fetal liver cDNA libraries and cloned a novel cDNA, STIM1, which they called GOK. The deduced 746- amino acid protein contains a predicted signal peptide and transmembrane helix. Parker et al. (1996) also cloned a partial mouse Stim1 genomic clone and found that the human and mouse proteins share 90% sequence identity. Restriction mapping by pulsed field electrophoresis placed the STIM1 gene 1.7 kb telomeric of the RRM1 gene (OMIM Ref. No. 180410) on 11p15.5 (Parker et al., 1996). Sabbioni et al. (1999) determined that the STIM1 gene contains 12 exons that span more than 250 kb between the RRM1 and NUP98 (OMIM Ref. No. 601021) genes.

[23235]

[23236] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23237] Parker, N. J.; Begley, C. G.; Smith, P. J.; Fox, R. M. : Molecular cloning of a novel human gene (D11S4896E) at chromosomal region 11p15.5. Genomics 37: 253- 256, 1996. ; and

[23238] Sabbioni, S.; Veronese, A.; Trubia, M.; Taramelli, R.; Barbanti- Brodano, G.; Croce, C. M.; Negrini, M. : Exon structure and promoter identification of STIM1 (alias GOK), a human gene ca.

[23239] Further studies establishing the function and utilities of STIM1 are found in John Hopkins OMIM database record ID 605921, and in cited publications listed in Table 5, which are hereby incorporated by reference.Serine/threonine kinase 38 like (STK38L, Accession NP_055815.1) is another GAM139 target gene, herein designated TARGET GENE. STK38L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STK38L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:4238, to the

nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23240] Another function of GAM139 is therefore inhibition of Serine/threonine kinase 38 like (STK38L, Accession NP_055815.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L.

[23241] TARSH (Accession NP_079077.1) is another GAM139 target gene, herein designated TARGET GENE. TARSH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TARSH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TARSH BINDING SITE, designated SEQ ID:6078, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23242] Another function of GAM139 is therefore inhibition of TARSH (Accession NP_079077.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TARSH.

[23243] T-box 1 (TBX1, Accession NP_005983.1) is another GAM139 target gene, herein designated TARGET GENE.

TBX1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TBX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX1 BINDING SITE, designated SEQ ID:4869, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23244] Another function of GAM139 is therefore inhibition of T-box 1 (TBX1, Accession NP_005983.1), a gene which may act as a transcription factor and contains a T- box DNA binding domain. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX1.

[23245] The function of TBX1 has been established by previous studies. Chieffo et al. (1997) described the identification, cloning, and characterization of the human TBX1 gene, which maps to the center of the DiGeorge syndrome (OMIM Ref. No. 188400) chromosomal region on 22q11.2. TBX1 is a member of a phylogenetically conserved family of genes that share a common DNA- binding domain, the T- box. T- box genes are transcription factors involved in the regulation of developmental processes (see OMIM Ref.

No. TBX2; 600747). Human and mouse TBX1 proteins share 98% amino acid identity overall and are identical except for 2 residues within the T- box domain. Expression of human TBX1 in adult and fetal tissues, as determined by Northern blot analysis, was similar to that found in the mouse. Additionally, using 3- prime RACE, Chieffo et al. (1997) demonstrated a differentially spliced message in adult skeletal muscle. Mouse Tbx1 had previously been shown to be expressed during early embryogenesis in the pharyngeal arches, pouches, and otic vesicle. Later in development, expression was seen in the vertebral column and tooth bud. Thus, the authors concluded that TBX1 is a candidate for some of the features seen in the 22q11 deletion syndrome.

[23246] Animal model experiments lend further support to the function of TBX1. The DiGeorge syndrome (DGS)/velocardiofacial syndrome (VCFS; 192430) is a relatively common human disorder, usually associated with deletions of 22q11. The genetic basis for the wide range of developmental anomalies in the heart, thymus, endocrine glands, and facial structures has been elusive. Jerome and Papaioannou (2001) investigated the potential role of TBX1 in DGS/VCFS by producing a null mutation in

mice. They found that mice heterozygous for the mutation had a high incidence of cardiac outflow tract anomalies, thus modeling one of the major abnormalities of the human syndrome. Moreover, Tbx1 - /- mice displayed a wide range of developmental anomalies encompassing almost all of the common DGS/VCFS features, including hypoplasia of thymus and parathyroid glands, cardiac outflow tract abnormalities, abnormal facial structures, abnormal vertebrae, and cleft palate. On the basis of this phenotype in mice, they proposed that TBX1 in humans is a key gene in the etiology of DGS/VCFS.

[23247] It is appreciated that the abovementioned animal model for TBX1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[23248] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23249] Chieffo, C.; Garvey, N.; Gong, W.; Roe, B.; Zhang, G.; Silver, L.; Emanuel, B. S.; Budarf, M. L. : Isolation and characterization of a gene from the DiGeorge chromosomal region homologous to the mouse Tbx1 gene. Genomics 43: 267- 277, 1997. ; and

[23250] Jerome, L. A.; Papaioannou, V. E. : DiGeorge syndrome phenotype in mice mutant for the T- box gene, Tbx1. Nature Genet. 27: 286- 291, 2001.

[23251] Further studies establishing the function and utilities of TBX1 are found in John Hopkins OMIM database record ID 602054, and in cited publications listed in Table 5, which are hereby incorporated by reference.Telomeric repeat binding factor 2, interacting protein (TERF2IP, Accession NP_061848.1) is another GAM139 target gene, herein designated TARGET GENE. TERF2IP BINDING SITE1 and TERF2IP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TERF2IP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TERF2IP BINDING SITE1 and TERF2IP BINDING SITE2, designated SEQ ID:16058 and SEQ ID:15403 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23252] Another function of GAM139 is therefore inhibition of Telomeric repeat binding factor 2, interacting protein (TERF2IP, Accession NP_061848.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with TERF2IP.

[23253] Transferrin (TF, Accession NP_001054.1) is another GAM139 target gene, herein designated TARGET GENE. TF BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TF BINDING SITE, designated SEQ ID:11063, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23254] Another function of GAM139 is therefore inhibition of Transferrin (TF, Accession NP_001054.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TF.

[23255] Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NP_068581.1) is another GAM139 target gene, herein designated TARGET GENE. TGIF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGIF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:10404, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23256] Another function of GAM139 is therefore inhibition of Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NP_068581.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2.

[23257] Trans-golgi network protein 2 (TGOLN2, Accession NP_006455.1) is another GAM139 target gene, herein designated TARGET GENE. TGOLN2 BINDING SITE1 and TGOLN2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGOLN2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGOLN2 BINDING SITE1 and TGOLN2 BINDING SITE2, designated SEQ ID:18006 and SEQ ID:11996 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23258] Another function of GAM139 is therefore inhibition of

Trans-golgi network protein 2 (TGOLN2, Accession NP_006455.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGOLN2.

[23259] Translocase of inner mitochondrial membrane 13 homolog (yeast) (TIMM13, Accession NP_036590.1) is another GAM139 target gene, herein designated TARGET GENE. TIMM13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIMM13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIMM13 BINDING SITE, designated SEQ ID:1880, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23260] Another function of GAM139 is therefore inhibition of Translocase of inner mitochondrial membrane 13 homolog (yeast) (TIMM13, Accession NP_036590.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM13.

[23261] Tumor necrosis factor receptor superfamily, member 13b (TNFRSF13B, Accession NP_036584.1) is another GAM139

target gene, herein designated TARGET GENE. TNFRSF13B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFRSF13B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF13B BINDING SITE, designated SEQ ID:9446, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23262] Another function of GAM139 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 13b (TNFRSF13B, Accession NP_036584.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF13B.

[23263] Tnf receptor-associated factor 5 (TRAF5, Accession NP_665702.1) is another GAM139 target gene, herein designated TARGET GENE. TRAF5 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRAF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

TRAF5 BINDING SITE, designated SEQ ID:5242, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23264] Another function of GAM139 is therefore inhibition of Tnf receptor-associated factor 5 (TRAF5, Accession NP_665702.1), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5.

[23265] The function of TRAF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM69.2.Three prime repair exonuclease 1 (TREX1, Accession NP_338598.1) is another GAM139 target gene, herein designated TARGET GENE. TREX1 BINDING SITE1 and TREX1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TREX1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 and TREX1 BINDING SITE2, designated SEQ ID:10243 and SEQ ID:9722

respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23266] Another function of GAM139 is therefore inhibition of Three prime repair exonuclease 1 (TREX1, Accession NP_338598.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1.

[23267] Three prime repair exonuclease 1 (TREX1, Accession NP_338597.1) is another GAM139 target gene, herein designated TARGET GENE. TREX1 BINDING SITE1 and TREX1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TREX1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 and TREX1 BINDING SITE2, designated SEQ ID:10243 and SEQ ID:9722 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23268] Another function of GAM139 is therefore inhibition of Three prime repair exonuclease 1 (TREX1, Accession NP_338597.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TREX1.

[23269] Trichorhinophalangeal syndrome i (TRPS1, Accession NP_054831.1) is another GAM139 target gene, herein designated TARGET GENE. TRPS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TRPS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:12768, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23270] Another function of GAM139 is therefore inhibition of Trichorhinophalangeal syndrome i (TRPS1, Accession NP_054831.1), a gene which may function as a transcriptional activator protein and therefore is associated with Trichorhinophalangeal syndrome type i, type iii. Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of Trichorhinophalangeal syndrome type i, type iii, and of other diseases and clinical conditions associated with TRPS1.

[23271] The function of TRPS1 has been established by previous studies. Trichorhinophalangeal syndrome type I (OMIM

Ref. No. 190350) is a malformation syndrome characterized by distinctive craniofacial and skeletal abnormalities and is inherited as an autosomal dominant. TRPS I patients have sparse scalp hair, bulbous tip of the nose, long flat philtrum, thin upper vermilion border, and protruding ears. Skeletal abnormalities include cone- shaped epiphyses at the phalanges, hip malformations, and short stature. Ludecke et al. (1995) and Hou et al. (1995) assigned the TRPS1 gene to 8q24. It maps centromeric to the gene that is mutant in multiple exostoses type I (EXT1; 133700); EXT1 is deleted in all patients with TRPS type II, or Langer- Giedion syndrome (OMIM Ref. No. 150230), which combines features of TRPS I and multiple exostoses. Momeni et al. (2000) positionally cloned a gene that spanned the chromosomal breakpoint in 2 patients with TRPS I and was deleted in 5 patients with TRPS I associated with an interstitial deletion. Northern blot analyses revealed transcripts of 7 and 10.5 kb. The gene, designated TRPS1, has 7 exons and encodes a polypeptide of 1,281 amino acids. The predicted protein sequence has 2 potential nuclear localization signals and an unusual combination of different zinc finger motifs, including IKAROS-like (see OMIM Ref. No. 603023) and GATA- binding (see

OMIM Ref. No. 600576) sequences. Momeni et al. (2000) identified 6 different nonsense mutations in 10 unrelated patients. The findings suggested that haploinsufficiency for this putative transcription factor causes TRPS I. To investigate whether trichorhinophalangeal syndrome type III (OMIM Ref. No. 190351) is caused by TRPS1 mutations and to establish a genotype- phenotype correlation in TRPS, Ludecke et al. (2001) performed extensive mutation analysis and evaluated height and degree of brachydactyly in patients with TRPS I or TRPS III. They found 35 different mutations in 44 of 51 unrelated patients. The detection rate (86%) indicated that TRPS1 is the major locus for TRPS I and TRPS III. They found no mutation in the parents of sporadic patients or in apparently healthy relatives of familial patients, indicating complete penetrance of TRPS1 mutations. Evaluation of skeletal abnormalities of patients with TRPS1 mutations revealed a wide clinical spectrum. The phenotype was variable in unrelated, age- and sex-matched patients with identical mutations, as well as in families. Four of the 5 missense mutations altered the GATA DNA- binding zinc finger, and 6 of the 7 unrelated patients with these mutations could be classified as having TRPS III, because they had severe bradycardia, due to

short metacarpals, and severe short stature. The data indicated that TRPS III is at the severe end of the TRPS spectrum and that it is most often caused by a specific class of mutations in exon 6 the TRPS1 gene. In the study of Ludecke et al. (2001), 5 mutations were recurrent, and 4 of these were identified in patients of different ethnicities: 1 in patients of Norwegian, Turkish, and Belgian extraction, and another in patients of Belgian, Turkish, and Japanese extraction, for example.

[23272]

[23273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23274] Momeni, P.; Glockner, G.; Schmidt, O.; von Holtum, D.; Albrecht, B.; Gillessen- Kaesbach, G.; Hennekam, R.; Meinecke, P.; Zabel, B.; Rosenthal, A.; Horsthemke, B.; Ludecke, H.- J. : Mutations in a new gene, encoding a zinc- finger protein, cause tricho- rhino- phalangeal syndrome type I. Nature Genet. 24: 71- 74, 2000. ; and

[23275] Ludecke, H.- J.; Schaper, J.; Meinecke, P.; Momeni, P.; Gross, S.; von Holtum, D.; Hirche, H.; Abramowicz, M. J.; Albrecht, B.; Apacik, C.; Christen, H.- J.; Claussen, U.; and 28 others : G.

[23276] Further studies establishing the function and utilities of TRPS1 are found in John Hopkins OMIM database record ID 604386, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tetratricopeptide repeat domain 7 (TTC7, Accession XP_031626.4) is another GAM139 target gene, herein designated TARGET GENE. TTC7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TTC7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TTC7 BINDING SITE, designated SEQ ID:8625, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23277] Another function of GAM139 is therefore inhibition of Tetratricopeptide repeat domain 7 (TTC7, Accession XP_031626.4) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC7.

[23278] Testis-specific transcript, y-linked 13 (TTTY13, Accession NP_114137.1) is another GAM139 target gene, herein designated TARGET GENE. TTTY13 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by TTTY13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TTTY13 BINDING SITE, designated SEQ ID:18081, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23279] Another function of GAM139 is therefore inhibition of Testis-specific transcript, y-linked 13 (TTTY13, Accession NP_114137.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY13.

[23280] U5-200KD (Accession NP_054733.1) is another GAM139 target gene, herein designated TARGET GENE. U5-200KD BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by U5-200KD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of U5-200KD BINDING SITE, designated SEQ ID:10933, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23281] Another function of GAM139 is therefore inhibition of

U5-200KD (Accession NP_054733.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-200KD.

[23282] UCK1 (Accession NP_113620.1) is another GAM139 target gene, herein designated TARGET GENE. UCK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UCK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UCK1 BINDING SITE, designated SEQ ID:7394, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23283] Another function of GAM139 is therefore inhibition of UCK1 (Accession NP_113620.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCK1.

[23284] Ubiquitin specific protease 20 (USP20, Accession NP_006667.2) is another GAM139 target gene, herein designated TARGET GENE. USP20 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP20, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP20 BINDING SITE, designated SEQ ID:3865, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23285] Another function of GAM139 is therefore inhibition of Ubiquitin specific protease 20 (USP20, Accession NP_006667.2) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP20.

[23286] Wd repeat domain 5b (WDR5B, Accession NP_061942.2) is another GAM139 target gene, herein designated TARGET GENE. WDR5B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by WDR5B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDR5B BINDING SITE, designated SEQ ID:6229, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23287] Another function of GAM139 is therefore inhibition of Wd repeat domain 5b (WDR5B, Accession NP_061942.2) . Accordingly, utilities of GAM139 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with WDR5B.

[23288] Wingless-type mmtv integration site family, member 3a (WNT3A, Accession NP_149122.1) is another GAM139 target gene, herein designated TARGET GENE. WNT3A BINDING SITE1 and WNT3A BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by WNT3A, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WNT3A BINDING SITE1 and WNT3A BINDING SITE2, designated SEQ ID:11109 and SEQ ID:18055 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23289] Another function of GAM139 is therefore inhibition of Wingless-type mmtv integration site family, member 3a (WNT3A, Accession NP_149122.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT3A.

[23290] Wingless-type mmtv integration site family, member 5b (WNT5B, Accession NP_110402.2) is another GAM139 tar-

get gene, herein designated TARGET GENE. WNT5B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WNT5B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WNT5B BINDING SITE, designated SEQ ID:9907, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23291] Another function of GAM139 is therefore inhibition of Wingless-type mmtv integration site family, member 5b (WNT5B, Accession NP_110402.2), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5B.

[23292] The function of WNT5B has been established by previous studies. The WNT gene family consists of structurally related genes encoding secreted signaling molecules that have been implicated in oncogenesis and in several developmental processes, including regulation of cell fate and patterning during embryogenesis. For general information

about WNT genes, see WNT1 (OMIM Ref. No. 164820). Using degenerate PCR and cDNA library screening to search for new members of the mouse Wnt family, Gavin et al. (1990) identified Wnt5b. Northern blot analysis detected expression of Wnt5b in all tissues tested, with the exception of adult spleen. In situ hybridization, detected expression of Wnt5b at low levels throughout the embryo and fetus from 6.5 to 14.5 days postcoitum. By searching human genome draft sequence for mouse Wnt5a homologs, Saitoh and Katoh (2001) identified WNT5B. Using database searches and PCR techniques, they assembled a WNT5B cDNA sequence. WNT5B encodes a deduced 359-amino acid protein with an N- terminal signal peptide, 4 N- linked glycosylation sites, and conserved residues of the WNT family. The WNT5B protein shares 80% sequence identity with WNT5A (OMIM Ref. No. 164975). Using Northern blot analysis, Saitoh and Katoh (2001) detected expression of 2.8- and 2.4- kb WNT5B transcripts at moderate levels in adult prostate and fetal brain and at low levels in fetal lung, kidney, adult liver, ovary, and small intestine. Using cDNA- PCR, the authors also detected WNT5B in gastric cancer and teratocarcinoma cell lines. Saitoh and Katoh (2001) determined that the WNT5B

gene contains 4 exons and spans about 16 kb of genomic DNA. Exon- intron boundaries are conserved between WNT5B and WNT5A, suggesting that the 2 genes may have been generated by duplication of an ancestral gene.

[23293]

[23294] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23295] Gavin, B. J.; McMahon, J. A.; McMahon, A. P. : Expression of multiple novel Wnt- 1/int- 1- related genes during fetal and adult mouse development. Genes Dev. 4: 2319-2332, 1990. ; and

[23296] Saitoh, T.; Katoh, M. : Molecular cloning and characterization of human WNT5B on chromosome 12p13.3 region. Int. J. Oncol. 19: 347- 351, 2001.

[23297] Further studies establishing the function and utilities of WNT5B are found in John Hopkins OMIM database record ID 606361, and in cited publications listed in Table 5, which are hereby incorporated by reference.Wingless-type mmtv integration site family, member 5b (WNT5B, Accession NP_116031.1) is another GAM139 target gene, herein designated TARGET GENE. WNT5B BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by WNT5B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WNT5B BINDING SITE, designated SEQ ID:9907, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23298] Another function of GAM139 is therefore inhibition of Wingless-type mmtv integration site family, member 5b (WNT5B, Accession NP_116031.1), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5B.

[23299] The function of WNT5B has been established by previous studies. The WNT gene family consists of structurally related genes encoding secreted signaling molecules that have been implicated in oncogenesis and in several developmental processes, including regulation of cell fate and patterning during embryogenesis. For general information about WNT genes, see WNT1 (OMIM Ref. No. 164820). Using degenerate PCR and cDNA library screening to search

for new members of the mouse Wnt family, Gavin et al. (1990) identified Wnt5b. Northern blot analysis detected expression of Wnt5b in all tissues tested, with the exception of adult spleen. In situ hybridization, detected expression of Wnt5b at low levels throughout the embryo and fetus from 6.5 to 14.5 days postcoitum. By searching human genome draft sequence for mouse Wnt5a homologs, Saitoh and Katoh (2001) identified WNT5B. Using database searches and PCR techniques, they assembled a WNT5B cDNA sequence. WNT5B encodes a deduced 359- amino acid protein with an N- terminal signal peptide, 4 N- linked glycosylation sites, and conserved residues of the WNT family. The WNT5B protein shares 80% sequence identity with WNT5A (OMIM Ref. No. 164975). Using Northern blot analysis, Saitoh and Katoh (2001) detected expression of 2.8- and 2.4- kb WNT5B transcripts at moderate levels in adult prostate and fetal brain and at low levels in fetal lung, kidney, adult liver, ovary, and small intestine. Saitoh and Katoh (2001) determined that the WNT5B gene contains 4 exons and spans about 16 kb of genomic DNA. Exon- intron boundaries are conserved between

WNT5B and WNT5A, suggesting that the 2 genes may have been generated by duplication of an ancestral gene.

[23300]

[23301] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23302] Gavin, B. J.; McMahon, J. A.; McMahon, A. P. : Expression of multiple novel Wnt- 1/int- 1- related genes during fetal and adult mouse development. Genes Dev. 4: 2319-2332, 1990. ; and

[23303] Saitoh, T.; Katoh, M. : Molecular cloning and characterization of human WNT5B on chromosome 12p13.3 region. Int. J. Oncol. 19: 347- 351, 2001.

[23304] Further studies establishing the function and utilities of WNT5B are found in John Hopkins OMIM database record ID 606361, and in cited publications listed in Table 5, which are hereby incorporated by reference.XPO6 (Accession XP_055195.3) is another GAM139 target gene, herein designated TARGET GENE. XPO6 BINDING SITE1 and XPO6 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by XPO6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of XPO6 BINDING SITE1 and XPO6 BINDING SITE2, designated SEQ ID:14323 and SEQ ID:1450 respectively, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23305] Another function of GAM139 is therefore inhibition of XPO6 (Accession XP_055195.3) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPO6.

[23306] Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, theta polypeptide (YWHAQ, Accession NP_006817.1) is another GAM139 target gene, herein designated TARGET GENE. YWHAQ BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by YWHAQ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of YWHAQ BINDING SITE, designated SEQ ID:15153, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23307] Another function of GAM139 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase

activation protein, theta polypeptide (YWHAQ, Accession NP_006817.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAQ.

[23308] ZNF408 (Accession NP_079017.1) is another GAM139 target gene, herein designated TARGET GENE. ZNF408 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF408 BINDING SITE, designated SEQ ID:3799, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23309] Another function of GAM139 is therefore inhibition of ZNF408 (Accession NP_079017.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF408.

[23310] Zyxin (ZYX, Accession NP_003452.1) is another GAM139 target gene, herein designated TARGET GENE. ZYX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZYX, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZYX BINDING SITE, designated SEQ ID:1825, to the nucleotide sequence of GAM139 RNA, herein designated GAM RNA, also designated SEQ ID:327.

[23311] Another function of GAM139 is therefore inhibition of Zyxin (ZYX, Accession NP_003452.1) . Accordingly, utilities of GAM139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZYX.

[23312]

[23313] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 140 (GAM140), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23314] GAM140 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM140 was detected is described hereinabove with reference to Figs. 8-15.

[23315] GAM140 gene, herein designated GAM GENE, and

GAM140 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[23316] GAM140 gene encodes a GAM140 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM140 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM140 precursor RNA is designated SEQ ID:51, and is provided hereinbelow with reference to the sequence listing part.

[23317] GAM140 precursor RNA folds onto itself, forming GAM140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23318] GAM140 precursor RNA folds onto itself, forming GAM140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[23319] Nucleotide sequence of GAM140 precursor RNA, designated SEQ-ID: 51, and a schematic representation of a predicted secondary folding of GAM140 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[23320] An enzyme complex designated DICER COMPLEX, `dices` the GAM140 folded precursor RNA into GAM140 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM140 RNA is designated SEQ ID:295, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[23321] GAM140 target gene, herein designated TARGET GENE,

encodes a corresponding messenger RNA, GAM140 target RNA, herein designated GAM TARGET RNA. GAM140 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23322] GAM140 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM140 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM140 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM140 RNA may have a different number of target binding sites in untranslated regions of a GAM140 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23323] The complementary binding of GAM140 RNA, herein designated GAM RNA, to target binding sites on GAM140 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM140 target RNA into GAM140 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23324] It is appreciated that GAM140 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM140 target genes. The mRNA of each one of this plurality of GAM140 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM140 RNA, herein designated GAM RNA, and which when bound by GAM140 RNA causes inhibition of translation of respective one or more GAM140 target proteins.

[23325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM140 gene, herein designated GAM GENE, on one or more GAM140 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23326] It is appreciated that specific functions and accordingly utilities of GAM140 correlate with, and may be deduced from, the identity of the target genes which GAM140 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23327]

[23328]

[23329] Brf1 homolog, subunit of rna polymerase iii transcription initiation factor iiib (s. cerevisiae) (BRF1, Accession NM_001519.2) is a GAM140 target gene, herein designated TARGET GENE. BRF1 BINDING SITE is a target bind-

ing site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BRF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRF1 BINDING SITE, designated SEQ ID:17247, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23330] A function of GAM140 is therefore inhibition of Brf1 homolog, subunit of rna polymerase iii transcription initiation factor iiib (s. cerevisiae) (BRF1, Accession NM_001519.2), a gene which is a general activator of RNA polymerase III. Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRF1.

[23331] The function of BRF1 has been established by previous studies. By screening a Burkitt lymphoma and other human cDNA cell libraries using degenerate PCR primers corresponding to peptide sequences of the 90- kD subunit of GTF3B, Wang and Roeder (1995) obtained a cDNA encoding TAF3B2, which they called TFIIIB90. Sequence analysis revealed that the 675- amino acid TAF3B2 protein contains a high mobility group protein- 2 (HMG2;

163906)- related region in the highly charged C- terminal half of the protein and a sequence related to GTF2B (OMIM Ref. No. 189963) in the N terminus. Western blot analysis showed that TAF3B2 is expressed as a 92- kD protein, the C terminus of which binds TBP. Recombinant TAF3B2 together with TBP, but neither alone, could replace purified natural GTF3B. Deletion of either the N- terminal GTF2B-related or the C- terminal HMG2- related half of the protein abolished activity. Mital et al. (1996) cloned a cDNA identical to the TAF3B2 cDNA obtained by Wang and Roeder (1995) except for scattered nucleotide differences and the presence of 6 additional nucleotides. These last differences change the open reading frame, predicting a different sequence over 67 amino acids of the TAF3B2 protein, which Mital et al. (1996) called BRF due to its homology with the S. cerevisiae BRF protein. Mital et al. (1996) confirmed the association of TAF3B2 with TBP reported by Wang and Roeder (1995).

[23332]

[23333] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23334] Wang, Z.; Roeder, R. G. : Structure and function of a hu-

man transcription factor TFIIIB subunit that is evolutionarily conserved and contains both TFIIB- and high- mobility- group protein 2- related domains. Proc. Nat. Acad. Sci. 92: 7026- 7030, 1995. ; and

[23335] Mital, R.; Kobayashi, R.; Hernandez, N. : RNA polymerase III transcription from the human U6 and adenovirus type 2 VAI promoters has different requirements for human BRF, a subunit of hu.

[23336] Further studies establishing the function and utilities of BRF1 are found in John Hopkins OMIM database record ID 604902, and in cited publications listed in Table 5, which are hereby incorporated by reference.DKFZP434K028 (Accession XM_167745.1) is another GAM140 target gene, herein designated TARGET GENE. DKFZP434K028 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434K028, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434K028 BINDING SITE, designated SEQ ID:7407, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23337] Another function of GAM140 is therefore inhibition of DK-

FZP434K028 (Accession XM_167745.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K028.

[23338] DKFZP564K1964 (Accession NM_015544.1) is another GAM140 target gene, herein designated TARGET GENE. DKFZP564K1964 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K1964, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564K1964 BINDING SITE, designated SEQ ID:10329, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23339] Another function of GAM140 is therefore inhibition of DKFZP564K1964 (Accession NM_015544.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K1964.

[23340] Deoxyribonuclease i-like 1 (DNASE1L1, Accession NM_006730.1) is another GAM140 target gene, herein designated TARGET GENE. DNASE1L1 BINDING SITE is a

target binding site found in the 5` untranslated region of mRNA encoded by DNASE1L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNASE1L1 BINDING SITE, designated SEQ ID:13997, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23341] Another function of GAM140 is therefore inhibition of Deoxyribonuclease i-like 1 (DNASE1L1, Accession NM_006730.1), a gene which seems to be involved in cell death. Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1L1.

[23342] The function of DNASE1L1 has been established by previous studies. Parrish et al. (1995) isolated a novel cDNA from the region of Xq28 between QM (OMIM Ref. No. 312173) and DXS1010E. Sequence similarity to DNase I (OMIM Ref. No. 125505) was high at the DNA and peptide sequence levels. The transcript was present at highest levels in skeletal and cardiac muscle, with lower expression in other tissues. Mutation analysis was performed using DNA samples from 2 unrelated patients with Barth

syndrome (OMIM Ref. No. 302060) and from 11 unrelated patients with Emery- Dreifuss muscular dystrophy (OMIM Ref. No. 310300), 2 genetic disorders involving muscle and with joint linkage to Xq28. No disease- associated mutations were detected in the coding region of the gene; however, Parrish et al. (1995) found a novel 190- bp insertion/deletion polymorphism in the 3- prime untranslated region. Translation of the long open reading frame found in the cDNA yielded a putative 302- amino acid protein with 37.6% identity to human DNase I. The protein was predicted to contain a signal sequence at the amino terminus, a transmembrane domain near the carboxyl terminus, and a helix- loop- helix domain. Pergolizzi et al. (1996) screened cDNA libraries with a cosmid that had been mapped to Xq28 in the region between RCP/GCP (303900; 303800) and G6PD (OMIM Ref. No. 305900). They obtained a 2.1- kb cDNA and showed that it encodes a putative 302- amino acid protein with 44% sequence identity to pig DNase I and 39% identity to human DNase I. Northern blots showed a single 2.0- kb transcript in adult heart and skeletal muscle and an additional transcript of 2.5 kb in some fetal tissues. (The sequence of Pergolizzi et al. (1996) was identical to that reported by Parrish et al.

(1995)).

[23343]

[23344] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23345] Parrish, J. E.; Ciccodicola, A.; Wehnert, M.; Cox, G. F.; Chen, E.; Nelson, D. L. : A muscle- specific DNase I- like gene in human Xq28. Hum. Molec. Genet. 4: 1557- 1564, 1995. ; and

[23346] Pergolizzi, R.; Appierto, V.; Bosetti, A.; DeBellis, G. L.; Rovida, E.; Biunno, I. : Cloning of a gene encoding a DNase I- like endonuclease in the human Xq28 region. Gene 168: 267- 270.

[23347] Further studies establishing the function and utilities of DNASE1L1 are found in John Hopkins OMIM database record ID 300081, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ11078 (Accession NM_018316.1) is another GAM140 target gene, herein designated TARGET GENE. FLJ11078 BINDING SITE is a target binding site found in the 3` untranslated re-gion of mRNA encoded by FLJ11078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of FLJ11078 BINDING SITE, designated SEQ ID:8946, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23348] Another function of GAM140 is therefore inhibition of FLJ11078 (Accession NM_018316.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11078.

[23349] FLJ14166 (Accession NM_024565.2) is another GAM140 target gene, herein designated TARGET GENE. FLJ14166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ14166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14166 BINDING SITE, designated SEQ ID:17286, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23350] Another function of GAM140 is therefore inhibition of FLJ14166 (Accession NM_024565.2) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14166.

[23351] Hemoglobin, alpha 2 (HBA2, Accession NM_000517.3) is another GAM140 target gene, herein designated TARGET GENE. HBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HBA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HBA2 BINDING SITE, designated SEQ ID:14247, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23352] Another function of GAM140 is therefore inhibition of Hemoglobin, alpha 2 (HBA2, Accession NM_000517.3) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBA2.

[23353] KIAA0721 (Accession NM_021648.3) is another GAM140 target gene, herein designated TARGET GENE. KIAA0721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0721 BINDING SITE, designated SEQ ID:17774, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23354] Another function of GAM140 is therefore inhibition of KIAA0721 (Accession NM_021648.3) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721.

[23355] KIAA0937 (Accession XM_166213.1) is another GAM140 target gene, herein designated TARGET GENE. KIAA0937 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0937, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:13222, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23356] Another function of GAM140 is therefore inhibition of KIAA0937 (Accession XM_166213.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937.

[23357] KIAA1655 (Accession) is another GAM140 target gene, herein designated TARGET GENE. KIAA1655 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1655, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:15383, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23358] Another function of GAM140 is therefore inhibition of KIAA1655 (Accession) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655.

[23359] KIAA1695 (Accession NM_025135.1) is another GAM140 target gene, herein designated TARGET GENE. KIAA1695 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1695, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1695 BINDING SITE, designated SEQ ID:3626, to the nucleotide sequence of GAM140 RNA, herein designated

GAM RNA, also designated SEQ ID:295.

[23360] Another function of GAM140 is therefore inhibition of KIAA1695 (Accession NM_025135.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1695.

[23361] LOC199692 (Accession NM_145295.1) is another GAM140 target gene, herein designated TARGET GENE. LOC199692 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199692, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199692 BINDING SITE, designated SEQ ID:5475, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23362] Another function of GAM140 is therefore inhibition of LOC199692 (Accession NM_145295.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199692.

[23363] LOC200138 (Accession) is another GAM140 target gene, herein designated TARGET GENE. LOC200138 BINDING

SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200138, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200138 BINDING SITE, designated SEQ ID:3123, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23364] Another function of GAM140 is therefore inhibition of LOC200138 (Accession) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200138.

[23365] LOC256369 (Accession) is another GAM140 target gene, herein designated TARGET GENE. LOC256369 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256369, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256369 BINDING SITE, designated SEQ ID:16565, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23366] Another function of GAM140 is therefore inhibition of LOC256369 (Accession) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256369.

[23367] MGC15827 (Accession NM_032882.1) is another GAM140 target gene, herein designated TARGET GENE. MGC15827 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15827, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15827 BINDING SITE, designated SEQ ID:12150, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23368] Another function of GAM140 is therefore inhibition of MGC15827 (Accession NM_032882.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15827.

[23369] Protein tyrosine phosphatase, receptor type, t (PTPRT, Accession NM_007050.3) is another GAM140 target gene, herein designated TARGET GENE. PTPRT BINDING SITE is a

target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPRT BINDING SITE, designated SEQ ID:3450, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23370] Another function of GAM140 is therefore inhibition of Protein tyrosine phosphatase, receptor type, t (PTPRT, Accession NM_007050.3) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRT.

[23371] Retinoic acid receptor, alpha (RARA, Accession NM_000964.1) is another GAM140 target gene, herein designated TARGET GENE. RARA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RARA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RARA BINDING SITE, designated SEQ ID:3866, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23372] Another function of GAM140 is therefore inhibition of Retinoic acid receptor, alpha (RARA, Accession NM_000964.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARA.

[23373] Retinoblastoma binding protein 7 (RBBP7, Accession NM_002893.2) is another GAM140 target gene, herein designated TARGET GENE. RBBP7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBBP7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBBP7 BINDING SITE, designated SEQ ID:6024, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23374] Another function of GAM140 is therefore inhibition of Retinoblastoma binding protein 7 (RBBP7, Accession NM_002893.2) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP7.

[23375] Serine/threonine kinase 38 (STK38, Accession NM_007271.1) is another GAM140 target gene, herein designated TARGET GENE. STK38 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by STK38, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STK38 BINDING SITE, designated SEQ ID:2689, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23376] Another function of GAM140 is therefore inhibition of Serine/threonine kinase 38 (STK38, Accession NM_007271.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38.

[23377] Zinc finger protein 287 (ZNF287, Accession NM_020653.1) is another GAM140 target gene, herein designated TARGET GENE. ZNF287 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF287, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF287 BINDING SITE, designated SEQ ID:3540, to the nucleotide sequence of GAM140 RNA, herein designated GAM RNA, also designated SEQ ID:295.

[23378] Another function of GAM140 is therefore inhibition of Zinc finger protein 287 (ZNF287, Accession NM_020653.1) . Accordingly, utilities of GAM140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF287.

[23379]

[23380] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 141 (GAM141), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23381] GAM141 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM141 was detected is described hereinabove with reference to Figs. 8-15.

[23382] GAM141 gene, herein designated GAM GENE, and GAM141 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[23383] GAM141 gene encodes a GAM141 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM141 precursor RNA does not encode a protein. A nucleotide sequence

identical or highly similar to the nucleotide sequence of GAM141 precursor RNA is designated SEQ ID:94, and is provided hereinbelow with reference to the sequence listing part.

[23384] GAM141 precursor RNA folds onto itself, forming GAM141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23385] GAM141 precursor RNA folds onto itself, forming GAM141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[23386] Nucleotide sequence of GAM141 precursor RNA, desig-

nated SEQ-ID: 94, and a schematic representation of a predicted secondary folding of GAM141 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[23387] An enzyme complex designated DICER COMPLEX, `dices` the GAM141 folded precursor RNA into GAM141 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM141 RNA is designated SEQ ID:357, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[23388] GAM141 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM141 target RNA, herein designated GAM TARGET RNA. GAM141 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23389] GAM141 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM141 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM141 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM141 RNA may have a different number of target binding sites in untranslated regions of a GAM141 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23390] The complementary binding of GAM141 RNA, herein designated GAM RNA, to target binding sites on GAM141 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, in-

hibits translation of GAM141 target RNA into GAM141 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23391] It is appreciated that GAM141 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM141 target genes. The mRNA of each one of this plurality of GAM141 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM141 RNA, herein designated GAM RNA, and which when bound by GAM141 RNA causes inhibition of translation of respective one or more GAM141 target proteins.

[23392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM141 gene, herein designated GAM GENE, on one or more GAM141 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by

those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23393] It is appreciated that specific functions and accordingly utilities of GAM141 correlate with, and may be deduced from, the identity of the target genes which GAM141 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23394]

[23395]

[23396] FLJ21156 (Accession NM_024602.1) is a GAM141 target gene, herein designated TARGET GENE. FLJ21156 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21156 BINDING SITE, designated SEQ ID:12599, to the nucleotide sequence of GAM141 RNA, herein designated GAM RNA, also designated SEQ ID:357.

[23397] A function of GAM141 is therefore inhibition of FLJ21156 (Accession NM_024602.1) . Accordingly, utilities of GAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21156.

[23398] LOC116437 (Accession XM_058185.2) is another GAM141 target gene, herein designated TARGET GENE. LOC116437 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC116437, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:16557, to the nucleotide sequence of GAM141 RNA, herein designated GAM RNA, also designated SEQ ID:357.

[23399] Another function of GAM141 is therefore inhibition of LOC116437 (Accession XM_058185.2) . Accordingly, utilities of GAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116437.

[23400] Zinc finger protein 236 (ZNF236, Accession NM_007345.1) is another GAM141 target gene, herein designated TARGET GENE. ZNF236 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by ZNF236, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF236 BINDING SITE, designated SEQ ID:9704, to the nucleotide sequence of GAM141 RNA, herein designated GAM RNA, also designated SEQ ID:357.

[23401] Another function of GAM141 is therefore inhibition of Zinc finger protein 236 (ZNF236, Accession NM_007345.1) . Accordingly, utilities of GAM141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF236.

[23402]

[23403] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 142 (GAM142), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23404] GAM142 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM142 was detected is described hereinabove with reference to Figs. 8-15.

[23405] GAM142 gene, herein designated GAM GENE, and GAM142 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[23406] GAM142 gene encodes a GAM142 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM142 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM142 precursor RNA is designated SEQ ID:92, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:92 is located at position 70918040 relative to chromosome 1.

[23407] GAM142 precursor RNA folds onto itself, forming GAM142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23408] GAM142 precursor RNA folds onto itself, forming GAM142 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[23409] Nucleotide sequence of GAM142 precursor RNA, designated SEQ-ID: 92, and a schematic representation of a predicted secondary folding of GAM142 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[23410] An enzyme complex designated DICER COMPLEX, `dices` the GAM142 folded precursor RNA into GAM142 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM142 RNA is designated SEQ ID:219, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby in-

corporated by reference.

[23411] GAM142 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM142 target RNA, herein designated GAM TARGET RNA. GAM142 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23412] GAM142 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM142 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM142 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM142 RNA may have a different number of target binding sites in untranslated regions of a GAM142 target RNA. It is further appreciated that while Fig. 8 depicts tar-

get binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23413] The complementary binding of GAM142 RNA, herein designated GAM RNA, to target binding sites on GAM142 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM142 target RNA into GAM142 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23414] It is appreciated that GAM142 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM142 target genes. The mRNA of each one of this plurality of GAM142 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM142 RNA, herein designated GAM RNA, and which when bound by GAM142 RNA causes inhibition of translation of respective one or more GAM142 target proteins.

[23415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by

GAM142 gene, herein designated GAM GENE, on one or more GAM142 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23416] It is appreciated that specific functions and accordingly utilities of GAM142 correlate with, and may be deduced from, the identity of the target genes which GAM142 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23417]

[23418]

[23419] ARGBP2 (Accession NP_003594.1) is a GAM142 target gene, herein designated TARGET GENE. ARGBP2 BINDING

SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ARGBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARGBP2 BINDING SITE, designated SEQ ID:16171, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23420] A function of GAM142 is therefore inhibition of ARGBP2 (Accession NP_003594.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARGBP2.

[23421] Atpase, h+ transporting, lysosomal 31kda, v1 subunit e isoform 1 (ATP6V1E1, Accession NP_001687.1) is another GAM142 target gene, herein designated TARGET GENE. ATP6V1E1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP6V1E1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V1E1 BINDING SITE, designated SEQ ID:15473, to the nucleotide sequence of GAM142

RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23422] Another function of GAM142 is therefore inhibition of Atpase, h+ transporting, lysosomal 31kda, v1 subunit e isoform 1 (ATP6V1E1, Accession NP_001687.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1E1.

[23423] Chromosome 14 open reading frame 37 (C14orf37, Accession XP_085124.2) is another GAM142 target gene, herein designated TARGET GENE. C14orf37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf37 BINDING SITE, designated SEQ ID:4925, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23424] Another function of GAM142 is therefore inhibition of Chromosome 14 open reading frame 37 (C14orf37, Accession XP_085124.2) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C14orf37.

[23425] DKFZp434H2111 (Accession XP_058513.6) is another GAM142 target gene, herein designated TARGET GENE. DKFZp434H2111 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp434H2111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434H2111 BINDING SITE, designated SEQ ID:3751, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23426] Another function of GAM142 is therefore inhibition of DKFZp434H2111 (Accession XP_058513.6) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434H2111.

[23427] DKFZp586C0721 (Accession XP_098416.1) is another GAM142 target gene, herein designated TARGET GENE. DKFZp586C0721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp586C0721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp586C0721 BINDING SITE, designated SEQ ID:881, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23428] Another function of GAM142 is therefore inhibition of DKFZp586C0721 (Accession XP_098416.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586C0721.

[23429] Dual specificity phosphatase 16 (DUSP16, Accession XP_039106.1) is another GAM142 target gene, herein designated TARGET GENE. DUSP16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DUSP16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DUSP16 BINDING SITE, designated SEQ ID:14144, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23430] Another function of GAM142 is therefore inhibition of Dual specificity phosphatase 16 (DUSP16, Accession

XP_039106.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP16.

[23431] FLJ22557 (Accession NP_078989.1) is another GAM142 target gene, herein designated TARGET GENE. FLJ22557 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22557, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22557 BINDING SITE, designated SEQ ID:15012, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23432] Another function of GAM142 is therefore inhibition of FLJ22557 (Accession NP_078989.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22557.

[23433] FLJ38426 (Accession NP_775882.1) is another GAM142 target gene, herein designated TARGET GENE. FLJ38426 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38426, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38426 BINDING SITE, designated SEQ ID:4649, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23434] Another function of GAM142 is therefore inhibition of FLJ38426 (Accession NP_775882.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38426.

[23435] FLJ39426 (Accession NP_775880.1) is another GAM142 target gene, herein designated TARGET GENE. FLJ39426 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ39426, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39426 BINDING SITE, designated SEQ ID:2533, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23436] Another function of GAM142 is therefore inhibition of FLJ39426 (Accession NP_775880.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ39426.

[23437] HRIHFB2122 (Accession NP_619538.1) is another GAM142 target gene, herein designated TARGET GENE. HRIHFB2122 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HRIHFB2122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRIHFB2122 BINDING SITE, designated SEQ ID:2665, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23438] Another function of GAM142 is therefore inhibition of HRIHFB2122 (Accession NP_619538.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2122.

[23439] Interleukin 13 receptor, alpha 1 (IL13RA1, Accession NP_001551.1) is another GAM142 target gene, herein designated TARGET GENE. IL13RA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL13RA1, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:10120, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23440] Another function of GAM142 is therefore inhibition of Interleukin 13 receptor, alpha 1 (IL13RA1, Accession NP_001551.1), a gene which binds il- 13 with a low affinity. together with il- 4r- alpha can form a functional receptor for il- 13 and therefore may be associated with Asthma and athopy. Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of Asthma and athopy, and of other diseases and clinical conditions associated with IL13RA1.

[23441] The function of IL13RA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.KIAA1954 (Accession XP_085375.4) is another GAM142 target gene, herein designated TARGET GENE. KIAA1954 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1954, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:15822, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23442] Another function of GAM142 is therefore inhibition of KIAA1954 (Accession XP_085375.4) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1954.

[23443] LOC116068 (Accession XP_057302.2) is another GAM142 target gene, herein designated TARGET GENE. LOC116068 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC116068, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116068 BINDING SITE, designated SEQ ID:11647, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23444] Another function of GAM142 is therefore inhibition of LOC116068 (Accession XP_057302.2) . Accordingly, utili-

ties of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116068.

[23445] LOC124411 (Accession XP_058804.4) is another GAM142 target gene, herein designated TARGET GENE. LOC124411 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC124411, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124411 BINDING SITE, designated SEQ ID:12342, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23446] Another function of GAM142 is therefore inhibition of LOC124411 (Accession XP_058804.4) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124411.

[23447] LOC145053 (Accession XP_096714.1) is another GAM142 target gene, herein designated TARGET GENE. LOC145053 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145053, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145053 BINDING SITE, designated SEQ ID:6065, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23448] Another function of GAM142 is therefore inhibition of LOC145053 (Accession XP_096714.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145053.

[23449] LOC149837 (Accession XP_097747.1) is another GAM142 target gene, herein designated TARGET GENE. LOC149837 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:8167, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23450] Another function of GAM142 is therefore inhibition of LOC149837 (Accession XP_097747.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149837.

[23451] LOC152519 (Accession XP_087483.3) is another GAM142 target gene, herein designated TARGET GENE. LOC152519 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152519, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152519 BINDING SITE, designated SEQ ID:719, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23452] Another function of GAM142 is therefore inhibition of LOC152519 (Accession XP_087483.3) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152519.

[23453] LOC158709 (Accession XP_088648.1) is another GAM142 target gene, herein designated TARGET GENE. LOC158709 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158709, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC158709 BINDING SITE, designated SEQ ID:9175, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23454] Another function of GAM142 is therefore inhibition of LOC158709 (Accession XP_088648.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158709.

[23455] LOC283714 (Accession XP_208803.1) is another GAM142 target gene, herein designated TARGET GENE. LOC283714 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283714, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283714 BINDING SITE, designated SEQ ID:15741, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23456] Another function of GAM142 is therefore inhibition of LOC283714 (Accession XP_208803.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC283714.

[23457] LOC284175 (Accession XP_211364.1) is another GAM142 target gene, herein designated TARGET GENE. LOC284175 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284175, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284175 BINDING SITE, designated SEQ ID:1851, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23458] Another function of GAM142 is therefore inhibition of LOC284175 (Accession XP_211364.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284175.

[23459] LOC286434 (Accession XP_301085.1) is another GAM142 target gene, herein designated TARGET GENE. LOC286434 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286434, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286434 BINDING SITE, designated SEQ ID:9175, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23460] Another function of GAM142 is therefore inhibition of LOC286434 (Accession XP_301085.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286434.

[23461] LOC339186 (Accession XP_294845.1) is another GAM142 target gene, herein designated TARGET GENE. LOC339186 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC339186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339186 BINDING SITE, designated SEQ ID:4620, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23462] Another function of GAM142 is therefore inhibition of LOC339186 (Accession XP_294845.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339186.

[23463] LOC339240 (Accession XP_294880.1) is another GAM142 target gene, herein designated TARGET GENE. LOC339240 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339240, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339240 BINDING SITE, designated SEQ ID:19571, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23464] Another function of GAM142 is therefore inhibition of

LOC339240 (Accession XP_294880.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339240.

[23465] LOC339258 (Accession XP_294886.1) is another GAM142 target gene, herein designated TARGET GENE. LOC339258 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339258 BINDING SITE, designated SEQ ID:19571, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23466] Another function of GAM142 is therefore inhibition of LOC339258 (Accession XP_294886.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339258.

[23467] LOC349429 (Accession XP_301083.1) is another GAM142 target gene, herein designated TARGET GENE. LOC349429 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349429, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349429 BINDING SITE, designated SEQ ID:9175, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23468] Another function of GAM142 is therefore inhibition of LOC349429 (Accession XP_301083.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349429.

[23469] LOC93380 (Accession NP_775741.1) is another GAM142 target gene, herein designated TARGET GENE. LOC93380 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93380, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93380 BINDING SITE, designated SEQ ID:14314, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23470] Another function of GAM142 is therefore inhibition of LOC93380 (Accession NP_775741.1) . Accordingly, utili-

ties of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93380.

[23471] N-ethylmaleimide-sensitive factor attachment protein, beta (NAPB, Accession XP_046652.2) is another GAM142 target gene, herein designated TARGET GENE. NAPB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NAPB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAPB BINDING SITE, designated SEQ ID:19771, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23472] Another function of GAM142 is therefore inhibition of N-ethylmaleimide-sensitive factor attachment protein, beta (NAPB, Accession XP_046652.2) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPB.

[23473] Nudix (nucleoside diphosphate linked moiety x)-type motif 4 (NUDT4, Accession NP_061967.2) is another GAM142 target gene, herein designated TARGET GENE. NUDT4 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by NUDT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUDT4 BINDING SITE, designated SEQ ID:4920, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23474] Another function of GAM142 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety x)-type motif 4 (NUDT4, Accession NP_061967.2) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT4.

[23475] Platelet-derived growth factor receptor, alpha polypeptide (PDGFRA, Accession NP_006197.1) is another GAM142 target gene, herein designated TARGET GENE. PDGFRA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDGFRA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:1956, to the nucleotide sequence of GAM142 RNA, herein designated

GAM RNA, also designated SEQ ID:219.

[23476] Another function of GAM142 is therefore inhibition of Platelet-derived growth factor receptor, alpha polypeptide (PDGFRA, Accession NP_006197.1), a gene which this receptor binds platelet- derived growth factor and has a tyrosine- protein kinase activity. and therefore may be associated with Basal cell carcinomas. Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of Basal cell carcinomas, and of other diseases and clinical conditions associated with PDGFRA.

[23477] The function of PDGFRA has been established by previous studies. Considerable insight into the role of the sonic hedgehog (OMIM Ref. No. 600725) pathway in vertebrate development and human cancers came from the discovery that mutations in `patched` (PTCH; 601309) are associated with basal cell nevus syndrome (BCNS; 109400), an autosomal dominant disorder combining developmental anomalies and tumors, particularly basal cell carcinomas (BCCs). Sporadic BCCs, the most common human cancer, consistently have abnormalities in the hedgehog pathway, and often mutations in PTCH. In addition, somatic mutations in `smoothened` (SMOH; 601500), another protein in the hedgehog pathway, occur in sporadic BCCs. The

downstream molecule GLI1 (OMIM Ref. No. 165220) is known to mediate the biologic effect of the hedgehog pathway and is itself upregulated in all BCCs. Gli1 can drive the production of BCCs in the mouse when overexpressed in the epidermis. Xie et al. (2001) showed that GLI1 can activate PDGFR- alpha and that functional upregulation of PDGFR- alpha by GLI1 is accompanied by activation of the Ras- ERK pathway, which is associated with cell proliferation. The relevance of this mechanism in vivo is supported by a high level of expression of PDGFR- alpha in BCCs in mice and humans. From these and other observations, Xie et al. (2001) concluded that increased expression of the PDGFR- alpha gene may be an important mechanism by which mutations in the hedgehog pathway cause BCCs.

[23478] Animal model experiments lend further support to the function of PDGFRA. Klinghoffer et al. (2001) created 2 complementary lines of knockin mice in which the intracellular signaling domains of one PDGFR had been removed and replaced by those of the other PDGFR. While both lines demonstrated substantial rescue of normal development, substitution of the Pdgfrb signaling domains with those of Pdgfra resulted in varying degrees of vascu-

lar disease.

[23479] It is appreciated that the abovementioned animal model for PDGFRA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[23480] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23481] Xie, J.; Aszterbaum, M.; Zhang, X.; Bonifas, J. M.; Zachary, C.; Epstein, E.; McCormick, F. : A role of PDGFR- alpha in basal cell carcinoma proliferation. Proc. Nat. Acad. Sci. 98: 9255- 9259, 2001. ; and

[23482] Klinghoffer, R. A.; Mueting- Nelsen, P. F.; Faerman, A.; Shani, M.; Soriano, P. : The two PDGF receptors maintain conserved signaling in vivo despite divergent embryological functions.

[23483] Further studies establishing the function and utilities of PDGFRA are found in John Hopkins OMIM database record ID 173490, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phd finger protein 3 (PHF3, Accession NP_055968.1) is another GAM142 target gene, herein designated TARGET GENE. PHF3 BINDING SITE is a target binding site found in the 3`

untranslated region of mRNA encoded by PHF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHF3 BINDING SITE, designated SEQ ID:2904, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23484] Another function of GAM142 is therefore inhibition of Phd finger protein 3 (PHF3, Accession NP_055968.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF3.

[23485] Recq protein-like 5 (RECQL5, Accession NP_004250.1) is another GAM142 target gene, herein designated TARGET GENE. RECQL5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RECQL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RECQL5 BINDING SITE, designated SEQ ID:8712, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23486] Another function of GAM142 is therefore inhibition of

Recq protein-like 5 (RECQL5, Accession NP_004250.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5.

[23487] Solute carrier family 12, (potassium-chloride transporter) member 5 (SLC12A5, Accession NP_065759.1) is another GAM142 target gene, herein designated TARGET GENE. SLC12A5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC12A5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC12A5 BINDING SITE, designated SEQ ID:3990, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23488] Another function of GAM142 is therefore inhibition of Solute carrier family 12, (potassium-chloride transporter) member 5 (SLC12A5, Accession NP_065759.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A5.

[23489] SV2A (Accession NP_055664.1) is another GAM142 target gene, herein designated TARGET GENE. SV2A BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SV2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SV2A BINDING SITE, designated SEQ ID:17235, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23490] Another function of GAM142 is therefore inhibition of SV2A (Accession NP_055664.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2A.

[23491] Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NP_542775.1) is another GAM142 target gene, herein designated TARGET GENE. SYTL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYTL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYTL4 BINDING SITE, designated SEQ ID:10244, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23492] Another function of GAM142 is therefore inhibition of Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NP_542775.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL4.

[23493] YKT6 (Accession NP_006546.1) is another GAM142 target gene, herein designated TARGET GENE. YKT6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by YKT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of YKT6 BINDING SITE, designated SEQ ID:13499, to the nucleotide sequence of GAM142 RNA, herein designated GAM RNA, also designated SEQ ID:219.

[23494] Another function of GAM142 is therefore inhibition of YKT6 (Accession NP_006546.1) . Accordingly, utilities of GAM142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YKT6.

[23495]

[23496] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 143

(GAM143), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23497] GAM143 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM143 was detected is described hereinabove with reference to Figs. 8-15.

[23498] GAM143 gene, herein designated GAM GENE, and GAM143 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[23499] GAM143 gene encodes a GAM143 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM143 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM143 precursor RNA is designated SEQ ID:21, and is provided hereinbelow with reference to the sequence listing part.

[23500] GAM143 precursor RNA folds onto itself, forming GAM143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23501] GAM143 precursor RNA folds onto itself, forming GAM143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[23502] Nucleotide sequence of GAM143 precursor RNA, designated SEQ-ID: 21, and a schematic representation of a predicted secondary folding of GAM143 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[23503] An enzyme complex designated DICER COMPLEX, `dices` the GAM143 folded precursor RNA into GAM143 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM143 RNA is designated SEQ ID:325, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[23504] GAM143 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM143 target RNA, herein designated GAM TARGET RNA. GAM143 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23505] GAM143 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM143 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM143 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING

SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM143 RNA may have a different number of target binding sites in untranslated regions of a GAM143 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23506] The complementary binding of GAM143 RNA, herein designated GAM RNA, to target binding sites on GAM143 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM143 target RNA into GAM143 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23507] It is appreciated that GAM143 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM143 target genes. The mRNA of each one of this plurality of GAM143 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM143 RNA,

herein designated GAM RNA, and which when bound by GAM143 RNA causes inhibition of translation of respective one or more GAM143 target proteins.

[23508] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM143 gene, herein designated GAM GENE, on one or more GAM143 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23509] It is appreciated that specific functions and accordingly utilities of GAM143 correlate with, and may be deduced from, the identity of the target genes which GAM143 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[23510]

[23511]

[23512] FLJ14442 (Accession NM_032785.1) is a GAM143 target gene, herein designated TARGET GENE. FLJ14442 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:8620, to the nucleotide sequence of GAM143 RNA, herein designated GAM RNA, also designated SEQ ID:325.

[23513] A function of GAM143 is therefore inhibition of FLJ14442 (Accession NM_032785.1) . Accordingly, utilities of GAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442.

[23514] KIAA0182 (Accession XM_050495.6) is another GAM143 target gene, herein designated TARGET GENE. KIAA0182 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0182, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:8498, to the nucleotide sequence of GAM143 RNA, herein designated GAM RNA, also designated SEQ ID:325.

[23515] Another function of GAM143 is therefore inhibition of KIAA0182 (Accession XM_050495.6) . Accordingly, utilities of GAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182.

[23516] LOC145231 (Accession XM_096740.1) is another GAM143 target gene, herein designated TARGET GENE. LOC145231 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145231, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:10431, to the nucleotide sequence of GAM143 RNA, herein designated GAM RNA, also designated SEQ ID:325.

[23517] Another function of GAM143 is therefore inhibition of LOC145231 (Accession XM_096740.1) . Accordingly, utilities of GAM143 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145231.

[23518] LOC149296 (Accession) is another GAM143 target gene, herein designated TARGET GENE. LOC149296 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149296, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149296 BINDING SITE, designated SEQ ID:10413, to the nucleotide sequence of GAM143 RNA, herein designated GAM RNA, also designated SEQ ID:325.

[23519] Another function of GAM143 is therefore inhibition of LOC149296 (Accession) . Accordingly, utilities of GAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149296.

[23520] LOC90139 (Accession NM_130783.1) is another GAM143 target gene, herein designated TARGET GENE. LOC90139 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of LOC90139 BINDING SITE, designated SEQ ID:4815, to the nucleotide sequence of GAM143 RNA, herein designated GAM RNA, also designated SEQ ID:325.

[23521] Another function of GAM143 is therefore inhibition of LOC90139 (Accession NM_130783.1) . Accordingly, utilities of GAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90139.

[23522] Mucin 3b (MUC3B, Accession XM_168578.2) is another GAM143 target gene, herein designated TARGET GENE. MUC3B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MUC3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:9337, to the nucleotide sequence of GAM143 RNA, herein designated GAM RNA, also designated SEQ ID:325.

[23523] Another function of GAM143 is therefore inhibition of Mucin 3b (MUC3B, Accession XM_168578.2), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly,

utilities of GAM143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B.

[23524] The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NM_004567.2) is another GAM143 target gene, herein designated TARGET GENE. PFKFB4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFKFB4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFKFB4 BINDING SITE, designated SEQ ID:7569, to the nucleotide sequence of GAM143 RNA, herein designated GAM RNA, also designated SEQ ID:325.

[23525] Another function of GAM143 is therefore inhibition of 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NM_004567.2), a gene which catalizes synthesis and degradation of fructose 2,6- bisphosphate. Accordingly, utilities of GAM143 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PFKFB4.

[23526] The function of PFKFB4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.

[23527] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 144 (GAM144), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23528] GAM144 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM144 was detected is described hereinabove with reference to Figs. 8-15.

[23529] GAM144 gene, herein designated GAM GENE, and GAM144 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[23530] GAM144 gene encodes a GAM144 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM144 precursor RNA does not encode a protein. A nucleotide sequence

identical or highly similar to the nucleotide sequence of GAM144 precursor RNA is designated SEQ ID:143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:143 is located at position 29007723 relative to chromosome 22.

[23531] GAM144 precursor RNA folds onto itself, forming GAM144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23532] GAM144 precursor RNA folds onto itself, forming GAM144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[23533] Nucleotide sequence of GAM144 precursor RNA, designated SEQ-ID: 143, and a schematic representation of a predicted secondary folding of GAM144 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[23534] An enzyme complex designated DICER COMPLEX, `dices` the GAM144 folded precursor RNA into GAM144 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM144 RNA is designated SEQ ID:361, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[23535] GAM144 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM144 target RNA, herein designated GAM TARGET RNA. GAM144 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[23536] GAM144 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM144 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM144 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM144 RNA may have a different number of target binding sites in untranslated regions of a GAM144 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23537] The complementary binding of GAM144 RNA, herein designated GAM RNA, to target binding sites on GAM144 target RNA, herein designated GAM TARGET RNA, such as

BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM144 target RNA into GAM144 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23538] It is appreciated that GAM144 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM144 target genes. The mRNA of each one of this plurality of GAM144 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM144 RNA, herein designated GAM RNA, and which when bound by GAM144 RNA causes inhibition of translation of respective one or more GAM144 target proteins.

[23539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM144 gene, herein designated GAM GENE, on one or more GAM144 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23540] It is appreciated that specific functions and accordingly utilities of GAM144 correlate with, and may be deduced from, the identity of the target genes which GAM144 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23541]

[23542]

[23543] AACS (Accession NP_076417.1) is a GAM144 target gene, herein designated TARGET GENE. AACS BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AACS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AACS BINDING SITE, designated SEQ ID:18383, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:361.

[23544] A function of GAM144 is therefore inhibition of AACS (Accession NP_076417.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AACS.

[23545] Atp-binding cassette, sub-family c (cftr/mrp), member 13 (ABCC13, Accession NP_742021.1) is another GAM144 target gene, herein designated TARGET GENE. ABCC13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCC13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCC13 BINDING SITE, designated SEQ ID:6955, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23546] Another function of GAM144 is therefore inhibition of Atp-binding cassette, sub-family c (cftr/mrp), member 13 (ABCC13, Accession NP_742021.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC13.

[23547] Adenylate cyclase 1 (brain) (ADCY1, Accession

NP_066939.1) is another GAM144 target gene, herein designated TARGET GENE. ADCY1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADCY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY1 BINDING SITE, designated SEQ ID:8386, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23548] Another function of GAM144 is therefore inhibition of Adenylate cyclase 1 (brain) (ADCY1, Accession NP_066939.1), a gene which a calmodulin- sensitive adenylyl cyclase. it may play a role in memory acquisition and learning. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY1.

[23549] The function of ADCY1 has been established by previous studies. The neural- specific, calmodulin- sensitive adenylyl cyclase (OMIM Ref. No. type I), which was first cloned from bovine brain, has been implicated in learning and memory. Villacres et al. (1993) cloned the gene for human fetal brain type I adenylyl cyclase and showed by in

situ hybridization that the gene lies in the region 7p13-p12. See 103070 and 103071 for genes encoding other forms of brain adenylyl cyclase. Gaudin et al. (1994) likewise mapped the ADCY1 gene to chromosome 7 by Southern blot analysis of somatic cell hybrid DNAs. By fluorescence in situ hybridization, Edelhoff et al. (1995) mapped the mouse homolog to chromosome 11 in the A2 region. The somatosensory cortex of mice displays a patterned, nonuniform distribution of neurons in layer IV called the 'barrelfield.' Thalamocortical afferents (TCAs) that terminate in layer IV are segregated such that each barrel, a readily visible cylindrical array of neurons surrounding a cell- sparse center, represents a distinct receptive field. TCA arbors are confined to the barrel hollow and synapse on barrel- wall neurons whose dendrites are oriented toward the center of the barrel. Mice homozygous for the 'barrelless' (brl) mutation, which occurred spontaneously in Switzerland, failed to develop this patterned distribution of neurons, but still displayed normal topologic organization of the somatosensory cortex (Welker et al., 1996). Despite the absence of barrels and the overlapping zones of TCA arborization, the size of individual whisker representations, as judged by 2- de-

oxyglucose uptake, was similar to that of wildtype mice. Abdel- Majid et al. (1998) identified Adcy1 as the gene disrupted in brl mutant mice by fine mapping of proximal chromosome 11, enzyme assay, mutation analysis, and examination of mice homozygous for a targeted disruption of Adcy1. These results provided the first evidence for involvement of cAMP signaling pathways in pattern formation of the brain.

[23550]

[23551] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23552] Edelhoff, S.; Villacres, E. C.; Storm, D. R.; Disteche, C. M. : Mapping of adenylyl cyclase genes type I, II, III, IV, V, and VI in mouse. Mammalian Genome 6: 111- 113, 1995. ; and

[23553] Abdel- Majid, R. M.; Leong, W. L.; Schalkwyk, L. C.; Smallman, D. S.; Wong, S. T.; Storm, D. R.; Fine, A.; Dobson, M. J.; Guernsey, D. L.; Neumann, P. E. : Loss of adenylyl cyclase I acti.

[23554] Further studies establishing the function and utilities of ADCY1 are found in John Hopkins OMIM database record ID 103072, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Adenylate cyclase 1 (brain) (ADCY1, Accession XP_166593.2) is another GAM144 target gene, herein designated TARGET GENE. ADCY1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADCY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY1 BINDING SITE, designated SEQ ID:8386, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23555] Another function of GAM144 is therefore inhibition of Adenylate cyclase 1 (brain) (ADCY1, Accession XP_166593.2), a gene which a calmodulin- sensitive adenylyl cyclase. it may play a role in memory acquisition and learning. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY1.

[23556] The function of ADCY1 has been established by previous studies. The neural- specific, calmodulin- sensitive adenylyl cyclase (OMIM Ref. No. type I), which was first cloned from bovine brain, has been implicated in learning

and memory. Villacres et al. (1993) cloned the gene for human fetal brain type I adenylyl cyclase and showed by in situ hybridization that the gene lies in the region 7p13-p12. See 103070 and 103071 for genes encoding other forms of brain adenylyl cyclase. Gaudin et al. (1994) likewise mapped the ADCY1 gene to chromosome 7 by Southern blot analysis of somatic cell hybrid DNAs. By fluorescence in situ hybridization, Edelhoff et al. (1995) mapped the mouse homolog to chromosome 11 in the A2 region. The somatosensory cortex of mice displays a patterned, nonuniform distribution of neurons in layer IV called the 'barrelfield.' Thalamocortical afferents (TCAs) that terminate in layer IV are segregated such that each barrel, a readily visible cylindrical array of neurons surrounding a cell- sparse center, represents a distinct receptive field. TCA arbors are confined to the barrel hollow and synapse on barrel- wall neurons whose dendrites are oriented toward the center of the barrel. Mice homozygous for the 'barrelless' (brl) mutation, which occurred spontaneously in Switzerland, failed to develop this patterned distribution of neurons, but still displayed normal topologic organization of the somatosensory cortex (Welker et al., 1996). Despite the absence of barrels and

the overlapping zones of TCA arborization, the size of individual whisker representations, as judged by 2- deoxyglucose uptake, was similar to that of wildtype mice. Abdel- Majid et al. (1998) identified Adcy1 as the gene disrupted in brl mutant mice by fine mapping of proximal chromosome 11, enzyme assay, mutation analysis, and examination of mice homozygous for a targeted disruption of Adcy1. These results provided the first evidence for involvement of cAMP signaling pathways in pattern formation of the brain.

[23557]

[23558] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23559] Edelhoff, S.; Villacres, E. C.; Storm, D. R.; Disteche, C. M. : Mapping of adenylyl cyclase genes type I, II, III, IV, V, and VI in mouse. Mammalian Genome 6: 111- 113, 1995. ; and

[23560] Abdel- Majid, R. M.; Leong, W. L.; Schalkwyk, L. C.; Smallman, D. S.; Wong, S. T.; Storm, D. R.; Fine, A.; Dobson, M. J.; Guernsey, D. L.; Neumann, P. E. : Loss of adenylyl cyclase I acti.

[23561] Further studies establishing the function and utilities of

ADCY1 are found in John Hopkins OMIM database record ID 103072, and in cited publications listed in Table 5, which are hereby incorporated by reference.Aldehyde dehydrogenase 3 family, member b2 (ALDH3B2, Accession NP_000686.1) is another GAM144 target gene, herein designated TARGET GENE. ALDH3B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALDH3B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALDH3B2 BINDING SITE, designated SEQ ID:3474, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23562] Another function of GAM144 is therefore inhibition of Aldehyde dehydrogenase 3 family, member b2 (ALDH3B2, Accession NP_000686.1), a gene which may play a role in alcohol detoxitation. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3B2.

[23563] The function of ALDH3B2 has been established by previous studies. See ALDH1 (OMIM Ref. No. 100640). Hsu et al. (1995) and Hsu and Chang (1996) reported the

cloning, sequencing and expression of the human ALDH8 gene. Hsu et al. (1997) determined the structure of the ALDH7 (OMIM Ref. No. 600466) and ALDH8 genes. The ALDH7 gene spans about 20 kb of genomic DNA and contains 9 coding exons. The ALDH8 gene is over 10 kb long and contains at least 10 exons. The ALDH8 gene contains an in- frame stop codon at the seventeenth codon position from the first initiator methionine. The coding region of the ALDH7 gene shows about 86% nucleotide identity with the corresponding region of the ALDH8 gene. The numbers and positions of the introns of the 2 genes are conserved, suggesting that gene duplication is involved in the expansion of the ALDH gene family. The human ALDH7 and ALDH8 genes have a close evolutionary relationship with human ALDH3 (OMIM Ref. No. 100660). The International Radiation Hybrid Mapping Consortium mapped the ALDH8 gene to chromosome 11 (OMIM Ref. No. U37519).

[23564]

[23565] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23566] Hsu, L. C.; Chang, W.- C. : Sequencing and expression of

the human ALDH8 encoding a new member of the aldehyde dehydrogenase family. Gene 174: 319- 322, 1996. ; and

[23567] Hsu, L. C.; Chang, W.- C.; Lin, S. W.; Yoshida, A. : Cloning and characterization of genes encoding four additional human aldehyde dehydrogenase isozymes. Adv. Exp. Med. Biol. 372: 159- 1.

[23568] Further studies establishing the function and utilities of ALDH3B2 are found in John Hopkins OMIM database record ID 601917, and in cited publications listed in Table 5, which are hereby incorporated by reference.APM1 (Accession NP_004788.1) is another GAM144 target gene, herein designated TARGET GENE. APM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:2427, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23569] Another function of GAM144 is therefore inhibition of APM1 (Accession NP_004788.1) . Accordingly, utilities of

GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[23570] Branched chain aminotransferase 2, mitochondrial (BCAT2, Accession NP_001181.1) is another GAM144 target gene, herein designated TARGET GENE. BCAT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BCAT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCAT2 BINDING SITE, designated SEQ ID:14160, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23571] Another function of GAM144 is therefore inhibition of Branched chain aminotransferase 2, mitochondrial (BCAT2, Accession NP_001181.1), a gene which catalyzes of the essential branched chain amino acids leucine, isoleucine, and valine and therefore may be associated with Hypervalinemia, hyperleucine- isoleucinemia. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Hypervalinemia, hyperleucine-isoleucinemia, and of other diseases and clinical conditions associated with BCAT2.

[23572] The function of BCAT2 has been established by previous studies. Jones and Moore (1979) provisionally assigned the BCT1 gene to 12pter- q12. Naylor and Shows (1979, 1980) also assigned BCT1 to chromosome 12 and BCT2 (OMIM Ref. No. 113530) to chromosome 19. There may be 2 different clinical disorders due to defect of branched-chain amino acid transamination, hypervalinemia (OMIM Ref. No. 277100) and hyperleucine- isoleucinemia (OMIM Ref. No. 238340). Since there are 2 distinct BCATs (see OMIM Ref. No. 113530), it is possible that one is mutant in each of these 2 conditions.

[23573]

[23574] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23575] Naylor, S. L.; Shows, T. B. : Branched- chain aminotransferase deficiency in Chinese hamster cells complemented by two independent genes on human chromosomes 12 and 19. Somat. Cell Genet. 6: 641- 652, 1980. ; and

[23576] Ben- Yosef, T.; Eden, A.; Benvenisty, N. : Characterization of murine BCAT genes: Bcat1, a c- Myc target, and its homolog, Bcat2. Mammalian Genome 9: 595- 597, 1998.

[23577] Further studies establishing the function and utilities of

BCAT2 are found in John Hopkins OMIM database record ID 113530, and in cited publications listed in Table 5, which are hereby incorporated by reference.BCLG (Accession NP_620048.1) is another GAM144 target gene, herein designated TARGET GENE. BCLG BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BCLG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCLG BINDING SITE, designated SEQ ID:16807, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23578] Another function of GAM144 is therefore inhibition of BCLG (Accession NP_620048.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCLG.

[23579] BCLG (Accession NP_110393.1) is another GAM144 target gene, herein designated TARGET GENE. BCLG BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BCLG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of BCLG BINDING SITE, designated SEQ ID:16807, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23580] Another function of GAM144 is therefore inhibition of BCLG (Accession NP_110393.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCLG.

[23581] BMF (Accession NP_277038.1) is another GAM144 target gene, herein designated TARGET GENE. BMF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BMF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:9278, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23582] Another function of GAM144 is therefore inhibition of BMF (Accession NP_277038.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF.

[23583] BTF (Accession NP_055554.1) is another GAM144 target

gene, herein designated TARGET GENE. BTF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BTF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTF BINDING SITE, designated SEQ ID:6208, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23584] Another function of GAM144 is therefore inhibition of BTF (Accession NP_055554.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTF.

[23585] BY55 (Accession NP_008984.1) is another GAM144 target gene, herein designated TARGET GENE. BY55 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BY55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BY55 BINDING SITE, designated SEQ ID:9405, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23586] Another function of GAM144 is therefore inhibition of BY55 (Accession NP_008984.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BY55.

[23587] C14orf69 (Accession NP_689546.1) is another GAM144 target gene, herein designated TARGET GENE. C14orf69 BINDING SITE1 and C14orf69 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C14orf69, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf69 BINDING SITE1 and C14orf69 BINDING SITE2, designated SEQ ID:15823 and SEQ ID:17914 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23588] Another function of GAM144 is therefore inhibition of C14orf69 (Accession NP_689546.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf69.

[23589] Chromosome 1 open reading frame 19 (C1orf19, Accession NP_443197.1) is another GAM144 target gene, herein

designated TARGET GENE. C1orf19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf19 BINDING SITE, designated SEQ ID:9890, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23590] Another function of GAM144 is therefore inhibition of Chromosome 1 open reading frame 19 (C1orf19, Accession NP_443197.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf19.

[23591] Chromosome 1 open reading frame 2 (C1orf2, Accession NP_006580.1) is another GAM144 target gene, herein designated TARGET GENE. C1orf2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf2 BINDING SITE, designated SEQ ID:6438, to the nucleotide sequence of GAM144 RNA,

herein designated GAM RNA, also designated SEQ ID:361.

[23592] Another function of GAM144 is therefore inhibition of Chromosome 1 open reading frame 2 (C1orf2, Accession NP_006580.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf2.

[23593] Chromosome 21 open reading frame 29 (C21orf29, Accession NP_659428.2) is another GAM144 target gene, herein designated TARGET GENE. C21orf29 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf29 BINDING SITE, designated SEQ ID:14016, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23594] Another function of GAM144 is therefore inhibition of Chromosome 21 open reading frame 29 (C21orf29, Accession NP_659428.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf29.

[23595] Chromosome 6 open reading frame 33 (C6orf33, Acces-

sion NP_588608.1) is another GAM144 target gene, herein designated TARGET GENE. C6orf33 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:4721, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23596] Another function of GAM144 is therefore inhibition of Chromosome 6 open reading frame 33 (C6orf33, Accession NP_588608.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33.

[23597] C6orf59 (Accession NP_079205.1) is another GAM144 target gene, herein designated TARGET GENE. C6orf59 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C6orf59, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf59 BINDING SITE, designated SEQ ID:1948, to the nucleotide

sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23598] Another function of GAM144 is therefore inhibition of C6orf59 (Accession NP_079205.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf59.

[23599] C6orf64 (Accession NP_060792.1) is another GAM144 target gene, herein designated TARGET GENE. C6orf64 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf64, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf64 BINDING SITE, designated SEQ ID:3256, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23600] Another function of GAM144 is therefore inhibition of C6orf64 (Accession NP_060792.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf64.

[23601] Chaperone, abc1 activity of bc1 complex like (s. pombe)

(CABC1, Accession NP_064632.1) is another GAM144 target gene, herein designated TARGET GENE. CABC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CABC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CABC1 BINDING SITE, designated SEQ ID:5724, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23602] Another function of GAM144 is therefore inhibition of Chaperone, abc1 activity of bc1 complex like (s. pombe) (CABC1, Accession NP_064632.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABC1.

[23603] Cd86 antigen (cd28 antigen ligand 2, b7-2 antigen) (CD86, Accession NP_787058.2) is another GAM144 target gene, herein designated TARGET GENE. CD86 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD86, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of CD86 BINDING SITE, designated SEQ ID:8499, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23604] Another function of GAM144 is therefore inhibition of Cd86 antigen (cd28 antigen ligand 2, b7-2 antigen) (CD86, Accession NP_787058.2), a gene which is a type I membrane protein of the immunoglobin superfamily and induces proliferation of T cells to antigens. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD86.

[23605] The function of CD86 has been established by previous studies. Induction of an immune response requires that T cells receive 2 sets of signals from antigen- presenting cells. The first signal is delivered through the T- cell receptor complex, while the second is provided by the B-cell activation antigens B7- 1, or CD80 (OMIM Ref. No. 112203), and B7- 2, or CD86, by interaction with the T-cell surface molecules, CD28 (OMIM Ref. No. 186760) and CTLA4 (OMIM Ref. No. 123890). A cDNA for B7- 2 was obtained by Freeman et al. (1993). B7- 2 mRNA is constitutively expressed in unstimulated B cells. The predicted protein is a type I membrane protein of the immunoglobin

superfamily Resting eosinophils express neither MHC class II proteins or costimulatory B7 molecules and fail to induce proliferation of T cells to antigens. Celestin et al. (2001) reported that IL3 (OMIM Ref. No. 147740) induces expression of HLA- DR and B7.2 on eosinophils, but, unlike IL5 (OMIM Ref. No. 147580) and GMCSF (CSF2; 138960), it does not induce expression of B7.1. IL3-treated eosinophils supported modest T- cell proliferation in response to superantigen toxic shock syndrome- 1 antigen, as well as proliferation of HLA- DR- restricted T-cell clones to tetanus toxoid (TT) and influenza virus antigenic peptides. The response was blocked by anti- B7.2 monoclonal antibody. IL3- treated eosinophils were unable to present native TT antigen to either resting or TT-specific cloned T cells. Parallel experiments established that IL5 and GMCSF induce T- cell proliferation to peptides but not to native TT antigen. Celestin et al. (2001) suggested that eosinophils activated by IL3 may contribute to T- cell activation in allergic and parasitic diseases by presenting superantigens and peptides to T cells

[23606]

[23607] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[23608] Freeman, G. J.; Gribben, J. G.; Boussiotis, V. A.; Ng, J. W.; Restivo, V. A.; Lombard, L. A.; Gray, G. S.; Nadler, L. M. : :Cloning of B7- 2: a CTLA- 4 counter- receptor that cos- timulates human T cell proliferation. Science 262: 909- 911, 1993. ; and

[23617] Further studies establishing the function and utilities of CD86 are found in John Hopkins OMIM database record ID 601020, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cdc42 effector protein (rho gtpase binding) 3 (CDC42EP3, Accession NP_006440.2) is another GAM144 target gene, herein designated TARGET GENE. CDC42EP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDC42EP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC42EP3 BINDING SITE, designated SEQ ID:12629, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA,

also designated SEQ ID:361.

[23618] Another function of GAM144 is therefore inhibition of Cdc42 effector protein (rho gtpase binding) 3 (CDC42EP3, Accession NP_006440.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42EP3.

[23619] Cadherin 5, type 2, ve-cadherin (vascular epithelium) (CDH5, Accession NP_001786.1) is another GAM144 target gene, herein designated TARGET GENE. CDH5 BINDING SITE1 and CDH5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CDH5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH5 BINDING SITE1 and CDH5 BINDING SITE2, designated SEQ ID:11221 and SEQ ID:19978 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23620] Another function of GAM144 is therefore inhibition of Cadherin 5, type 2, ve-cadherin (vascular epithelium) (CDH5, Accession NP_001786.1), a gene which associates with alpha- catenin forming a link to the cytoskeleton.

Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH5.

[23621] The function of CDH5 has been established by previous studies. Cadherins are calcium- dependent adhesive proteins that mediate cell- to- cell interaction. Huber et al. (1996) noted that they constitute an expanding family of receptors involved in the structural and functional organization of cells in various tissues. Members of the family include epithelial cadherin (E- cadherin; 192090), neural cadherin (N- cadherin; 114020), placental cadherin (P-cadherin; 114021), muscle cadherin (M- cadherin; 114019), and vascular endothelial cadherin (VE- cadherin, or CDH5). They share a common domain structure and primary sequence homologies. Each cadherin type has a unique tissue- distribution pattern. In most of them, expression is not restricted to 1 cell type, and more than 1 cadherin type may be found at the surface of a particular cell. The authors stated that endothelial cells have been shown to express N- cadherin, VE- cadherin, and to a lesser extent, P- cadherin. Among these, only VE- cadherin is expressed specifically in endothelial cells (Salomon et al., 1992). Furthermore, VE- cadherin is asso-

ciated consistently with intercellular junctions, whereas N-cadherin remains diffuse on the cell membrane. In order to define the role of CDH5 and of its binding to beta-catenin (see OMIM Ref. No. 116806) in intracellular signaling, Carmeliet et al. (1999) generated mice that lacked a functional Cdh5 gene, that expressed a mutant Cdh5 gene lacking the beta- catenin- binding cytoplasmic tail, or that did not express detectable Cdh5 levels because of an intronic neomycin phosphotransferase (neo) gene. They found in all of these mice that deletion or truncation of the Cdh5 gene did not affect assembly of endothelial cells in vascular plexi, but did impair their subsequent remodeling and maturation, causing lethality at 9.5 days of gestation. Deficiency or truncation of Cdh5 induced endothelial apoptosis and abolished transmission of the endothelial survival signal by vascular endothelial growth factor A (VEGF; 192240) to AKT kinase (OMIM Ref. No. 164730) and BCL2 (OMIM Ref. No. 151430) via reduced complex formation with VEGF receptor- 2 (OMIM Ref. No. 191306), beta- catenin, and phosphoinositide- 3 kinase (see OMIM Ref. No. 171833). Thus, Carmeliet et al. (1999) concluded that CDH5/beta- catenin signaling controls endothelial survival.

[23622]

[23623] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23624] Carmeliet, P.; Lampugnani, M.- G.; Moons, L.; Breviario, F.; Compernolle, V.; Bono, F.; Balconi, G.; Spagnuolo, R.; Oosthuyse, B.; Dewerchin, M.; Zanetti, A.; Angellilo, A.; and 11 others : Targeted deficiency of cytosolic truncation of the VE- cadherin gene in mice impairs VEGF- mediated endothelial survival and angiogenesis. Cell 98: 147- 157, 1999. ; and

[23626] Further studies establishing the function and utilities of CDH5 are found in John Hopkins OMIM database record ID 601120, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cat eye syndrome chromosome region, candidate 7 (CECR7, Accession XP_086803.1) is another GAM144 target gene, herein designated TARGET GENE. CECR7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA

encoded by CECR7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CECR7 BINDING SITE, designated SEQ ID:8985, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23627] Another function of GAM144 is therefore inhibition of Cat eye syndrome chromosome region, candidate 7 (CECR7, Accession XP_086803.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR7.

[23628] Carbohydrate (chondroitin 6) sulfotransferase 3 (CHST3, Accession NP_004264.2) is another GAM144 target gene, herein designated TARGET GENE. CHST3 BINDING SITE1 and CHST3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CHST3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE1 and CHST3 BINDING SITE2, designated SEQ ID:16447 and SEQ ID:18607 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23629] Another function of GAM144 is therefore inhibition of Carbohydrate (chondroitin 6) sulfotransferase 3 (CHST3, Accession NP_004264.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3.

[23630] Carbohydrate (n-acetylglucosamine 6-o) sulfotransferase 6 (CHST6, Accession NP_067628.1) is another GAM144 target gene, herein designated TARGET GENE. CHST6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHST6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST6 BINDING SITE, designated SEQ ID:3167, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23631] Another function of GAM144 is therefore inhibition of Carbohydrate (n-acetylglucosamine 6-o) sulfotransferase 6 (CHST6, Accession NP_067628.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST6.

[23632] CLIPR-59 (Accession NP_056341.1) is another GAM144 target gene, herein designated TARGET GENE. CLIPR-59

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLIPR-59, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLIPR-59 BINDING SITE, designated SEQ ID:2842, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23633] Another function of GAM144 is therefore inhibition of CLIPR-59 (Accession NP_056341.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR-59.

[23634] Collagen, type xix, alpha 1 (COL19A1, Accession NP_001849.1) is another GAM144 target gene, herein designated TARGET GENE. COL19A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL19A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:15138, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA,

also designated SEQ ID:361.

[23635] Another function of GAM144 is therefore inhibition of Collagen, type xix, alpha 1 (COL19A1, Accession NP_001849.1), a gene which may act as a cross- bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1.

[23636] The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Collagen, type i, alpha 1 (COL1A1, Accession NP_000079.1) is another GAM144 target gene, herein designated TARGET GENE. COL1A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL1A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL1A1 BINDING SITE, designated SEQ ID:6641, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23637] Another function of GAM144 is therefore inhibition of

Collagen, type i, alpha 1 (COL1A1, Accession NP_000079.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A1.

[23638] D2S448 (Accession XP_056455.2) is another GAM144 target gene, herein designated TARGET GENE. D2S448 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by D2S448, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of D2S448 BINDING SITE, designated SEQ ID:9361, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23639] Another function of GAM144 is therefore inhibition of D2S448 (Accession XP_056455.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D2S448.

[23640] Deleted in colorectal carcinoma (DCC, Accession NP_005206.1) is another GAM144 target gene, herein designated TARGET GENE. DCC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCC, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCC BINDING SITE, designated SEQ ID:1702, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23641] Another function of GAM144 is therefore inhibition of Deleted in colorectal carcinoma (DCC, Accession NP_005206.1), a gene which may participate with other proteins in cell- cell and cell- matrix interactions. and therefore may be associated with Colorectal carcinomas. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Colorectal carcinomas., and of other diseases and clinical conditions associated with DCC.

[23642] The function of DCC has been established by previous studies. Gotley et al. (1996) examined the expression of the DCC gene in colorectal cancers and metastases. Using RT- PCR, they detected DCC mRNA in all colonic tissue specimens through all stages of tumor development. Using monoclonal antibodies against DCC, they found DCC protein is abundant in normal human bladder and is detectable in colon, pancreas and kidney, but not in liver. DCC protein could be detected in varying abundance in all

specimens of normal colonic mucosa analyzed as well as in all specimens of adenomatous polyps, colorectal carcinoma and colorectal liver metastases. In some patients, tumor tissue contained less DCC protein than the adjacent normal mucosa. Gotley et al. (1996) found no cases of complete loss of DCC mRNA or protein in colon cancers or metastases. Axonal growth cones that cross the nervous system midline change their responsiveness to midline guidance cues: they become repelled by the repellent Slit (OMIM Ref. No. 603746) and simultaneously lose responsiveness to the attractant netrin. These mutually reinforcing changes help to expel growth cones from the midline by making a once- attractive environment appear repulsive. Stein and Tessier- Lavigne (2001) provided evidence that these 2 changes are causally linked: in the growth cones of embryonic Xenopus spinal axons, activation of the Slit receptor Roundabout (Robo; 602430) silences the attractive effect of netrin- 1, but not its growth- stimulatory effect, through direct binding of the cytoplasmic domain of Robo to that of the netrin receptor DCC. Biologically, this hierarchical silencing mechanism helps to prevent a tug of war between attractive and repulsive signals in the growth cone that might cause confusion. Molecu-

larly, silencing is enabled by a modular and interlocking design of the cytoplasmic domains of these potentially antagonistic receptors that predetermines the outcome of their simultaneous activation

[23643]

[23644] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23645] Stein, E.; Tessier- Lavigne, M. : Hierarchical organization of guidance receptors: silencing of netrin attraction by Slit through a Robo/DCC receptor complex. Science 291: 1928- 1938, 2001. ; and

[23647] Further studies establishing the function and utilities of DCC are found in John Hopkins OMIM database record ID 120470, and in cited publications listed in Table 5, which are hereby incorporated by reference.DDX54 (Accession NP_076977.2) is another GAM144 target gene, herein designated TARGET GENE. DDX54 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by DDX54, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX54 BINDING SITE, designated SEQ ID:11738, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23648] Another function of GAM144 is therefore inhibition of DDX54 (Accession NP_076977.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX54.

[23649] dJ55C23.6 (Accession NP_439896.1) is another GAM144 target gene, herein designated TARGET GENE. dJ55C23.6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by dJ55C23.6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of dJ55C23.6 BINDING SITE, designated SEQ ID:5224, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23650] Another function of GAM144 is therefore inhibition of dJ55C23.6 (Accession NP_439896.1) . Accordingly, utili-

ties of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with dJ55C23.6.

[23651] DKFZP434C171 (Accession NP_056436.1) is another GAM144 target gene, herein designated TARGET GENE. DKFZP434C171 BINDING SITE1 and DKFZP434C171 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DKFZP434C171, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434C171 BINDING SITE1 and DKFZP434C171 BINDING SITE2, designated SEQ ID:4768 and SEQ ID:16009 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23652] Another function of GAM144 is therefore inhibition of DKFZP434C171 (Accession NP_056436.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C171.

[23653] DKFZP434D193 (Accession XP_114297.2) is another GAM144 target gene, herein designated TARGET GENE. DKFZP434D193 BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by DKFZP434D193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434D193 BINDING SITE, designated SEQ ID:19475, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23654] Another function of GAM144 is therefore inhibition of DKFZP434D193 (Accession XP_114297.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D193.

[23655] DKFZP586M0622 (Accession NP_056398.1) is another GAM144 target gene, herein designated TARGET GENE. DKFZP586M0622 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586M0622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586M0622 BINDING SITE, designated SEQ ID:12078, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:361.

[23656] Another function of GAM144 is therefore inhibition of DKFZP586M0622 (Accession NP_056398.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M0622.

[23657] DKFZp761P1010 (Accession NP_060893.1) is another GAM144 target gene, herein designated TARGET GENE. DKFZp761P1010 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761P1010, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761P1010 BINDING SITE, designated SEQ ID:14315, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23658] Another function of GAM144 is therefore inhibition of DKFZp761P1010 (Accession NP_060893.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761P1010.

[23659] Dnaj (hsp40) homolog, subfamily c, member 8 (DNAJC8,

Accession NP_055095.1) is another GAM144 target gene, herein designated TARGET GENE. DNAJC8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNAJC8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAJC8 BINDING SITE, designated SEQ ID:20028, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23660] Another function of GAM144 is therefore inhibition of Dnaj (hsp40) homolog, subfamily c, member 8 (DNAJC8, Accession NP_055095.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC8.

[23661] Dna (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NP_787063.1) is another GAM144 target gene, herein designated TARGET GENE. DNMT3L BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DNMT3L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of DNMT3L BINDING SITE, designated SEQ ID:11497, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23662] Another function of GAM144 is therefore inhibition of Dna (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NP_787063.1), a gene which plays a role in de novo methylation of CpG islands. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3L.

[23663] The function of DNMT3L has been established by previous studies. By database analysis, PCR with specific primers based on predicted and trapped exon sequences, and screening of testis, fetal liver, placenta, and thymus mRNA and cDNA libraries, Aapola et al. (2000) isolated a cDNA encoding DNMT3L. Sequence analysis predicted that the 387- amino acid protein contains a cysteine- rich region with a novel ADD (for ATRX (OMIM Ref. No. 300032), DNMT3, and DNMT3L) C2- C2 zinc finger motif near an imperfect PHD zinc finger with C4- C4. RT- PCR analysis detected highest expression of DNMT3L in testis, followed by ovary, thymus, and fetal thymus. Northern blot analysis failed to detected expression of DNMT3L. By genomic sequence analysis, Aapola et al. (2000) determined that the

DNMT3L gene contains 12 exons and spans 16 kb. The translation initiation codon is in exon 2. The authors detected a splice variant lacking exon 8.

[23664] Animal model experiments lend further support to the function of DNMT3L. By disrupting homologous recombination in mouse embryonic stem cells, Bourc'his et al. (2001) generated viable but sterile mice with mutated Dnmt3l (termed Dnmt3lG) in which male testes had severe hypogonadism and a Sertoli cell- only phenotype. The heterozygous offspring of females with Dnmt3lG failed to develop past 9.5 days postcoitum due to embryonic rather than uterine defects. Bisulfite genomic sequence analysis of the differentially methylated region (DMR) of imprinted and maternally repressed genes such as Snrpn (OMIM Ref. No. 182279) detected undermethylation of oocytes from Dnmt3lG homozygous females, showing that Dnmt3l is required for the establishment of maternal methylation imprints. Heterozygous embryos from Dnmt3lG homozygotes displayed biallelic expression of genes that are normally expressed only from the allele of paternal origin. Bourc'his et al. (2001) concluded that DNMT3L is required specifically for the establishment of genomic imprints but is dispensable for their propagation, and it is essential for

the de novo methylation of single- copy DNA sequences. The authors proposed that DNMT3L is likely to function as a regulator of methylation at imprinted loci rather than a DNA cytosine methyltransferase because of a lack of catalytic motifs in its sequence.

[23665] It is appreciated that the abovementioned animal model for DNMT3L is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[23666] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23667] Aapola, U.; Shibuya, K.; Scott, H. S.; Ollila, J.; Vihinen, M.; Heino, M.; Shintani, A.; Kawasaki, K.; Minoshima, S.; Krohn, K.; Antonarakis, S. [23669] Further studies establishing the function and utilities of

DNMT3L are found in John Hopkins OMIM database record ID 606588, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dna (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NP_037501.2) is another GAM144 target gene, herein designated TARGET GENE. DNMT3L BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DNMT3L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNMT3L BINDING SITE, designated SEQ ID:11497, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23670] Another function of GAM144 is therefore inhibition of Dna (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NP_037501.2), a gene which plays a role in de novo methylation of CpG islands. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3L.

[23671] The function of DNMT3L has been established by previous studies. By database analysis, PCR with specific primers based on predicted and trapped exon sequences, and

screening of testis, fetal liver, placenta, and thymus mRNA and cDNA libraries, Aapola et al. (2000) isolated a cDNA encoding DNMT3L. Sequence analysis predicted that the 387- amino acid protein contains a cysteine- rich region with a novel ADD (for ATRX (OMIM Ref. RT- PCR analysis detected highest expression of DNMT3L in testis, followed by ovary, thymus, and fetal thymus. Northern blot analysis failed to detected expression of DNMT3L. By genomic sequence analysis, Aapola et al. (2000) determined that the DNMT3L gene contains 12 exons and spans 16 kb. The translation initiation codon is in exon 2. The authors detected a splice variant lacking exon 8.

[23672] Animal model experiments lend further support to the function of DNMT3L. By disrupting homologous recombination in mouse embryonic stem cells, Bourc'his et al. (2001) generated viable but sterile mice with mutated Dnmt3l (termed Dnmt3lG) in which male testes had severe hypogonadism and a Sertoli cell- only phenotype. The heterozygous offspring of females with Dnmt3lG failed to develop past 9.5 days postcoitum due to embryonic rather than uterine defects. Bisulfite genomic sequence analysis

of the differentially methylated region (DMR) of imprinted and maternally repressed genes such as Snrpn (OMIM Ref. No. 182279) detected undermethylation of oocytes from Dnmt3lG homozygous females, showing that Dnmt3l is required for the establishment of maternal methylation imprints. Heterozygous embryos from Dnmt3lG homozygotes displayed biallelic expression of genes that are normally expressed only from the allele of paternal origin. Bourc'his et al. (2001) concluded that DNMT3L is required specifically for the establishment of genomic imprints but is dispensable for their propagation, and it is essential for the de novo methylation of single- copy DNA sequences. The authors proposed that DNMT3L is likely to function as a regulator of methylation at imprinted loci rather than a DNA cytosine methyltransferase because of a lack of catalytic motifs in its sequence.

[23673] It is appreciated that the abovementioned animal model for DNMT3L is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[23674] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23675] Aapola, U.; Shibuya, K.; Scott, H. S.; Ollila, J.; Vihinen, M.; Heino, M.; Shintani, A.; Kawasaki, K.; Minoshima, S.; Krohn, K.; Antonarakis, S. E.; Shimizu, N.; Kudoh, J.; Peterson, P. : Isolation and initial characterization of a novel zinc finger gene, DNMT3L, on 21q22.3, related to the cysteine- 5- methyltransferase 3 gene family. Genomics 65: 293- 298, 2000. ; and

[23676] Bourc'his, D.; Xu, G.- L.; Lin, C.- S.; Bollman, B.; Bestor, T. H. : Dnmt3L and the establishment of maternal genomic imprints. Science 294: 2536- 2539, 2001.

[23677] Further studies establishing the function and utilities of DNMT3L are found in John Hopkins OMIM database record ID 606588, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dolichyl-phosphate mannosyltransferase polypeptide 2, regulatory subunit (DPM2, Accession NP_003854.1) is another GAM144 target gene, herein designated TARGET GENE. DPM2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPM2 BINDING

SITE, designated SEQ ID:5244, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23678] Another function of GAM144 is therefore inhibition of Dolichyl-phosphate mannosyltransferase polypeptide 2, regulatory subunit (DPM2, Accession NP_003854.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPM2.

[23679] Dolichyl-phosphate mannosyltransferase polypeptide 2, regulatory subunit (DPM2, Accession NP_689903.1) is another GAM144 target gene, herein designated TARGET GENE. DPM2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPM2 BINDING SITE, designated SEQ ID:5244, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23680] Another function of GAM144 is therefore inhibition of Dolichyl-phosphate mannosyltransferase polypeptide 2,

regulatory subunit (DPM2, Accession NP_689903.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPM2.

[23681] Egf-like-domain, multiple 4 (EGFL4, Accession XP_290821.1) is another GAM144 target gene, herein designated TARGET GENE. EGFL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EGFL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:2374, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23682] Another function of GAM144 is therefore inhibition of Egf-like-domain, multiple 4 (EGFL4, Accession XP_290821.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4.

[23683] EGFL7 (Accession NP_057299.1) is another GAM144 target gene, herein designated TARGET GENE. EGFL7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EGFL7, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGFL7 BINDING SITE, designated SEQ ID:12268, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23684] Another function of GAM144 is therefore inhibition of EGFL7 (Accession NP_057299.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL7.

[23685] Eukaryotic translation initiation factor 4e binding protein 2 (EIF4EBP2, Accession NP_004087.1) is another GAM144 target gene, herein designated TARGET GENE. EIF4EBP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EIF4EBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF4EBP2 BINDING SITE, designated SEQ ID:5134, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23686] Another function of GAM144 is therefore inhibition of Eukaryotic translation initiation factor 4e binding protein 2

(EIF4EBP2, Accession NP_004087.1), a gene which binds EIF4E and negatively regulates initiation of translation. and therefore may be associated with Cancers. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Cancers, and of other diseases and clinical conditions associated with EIF4EBP2.

[23687] The function of EIF4EBP2 has been established by previous studies. Pause et al. (1994) reported that the 4EBP2 gene encodes a 120- amino acid polypeptide that is 56% identical to that of 4EBP1 (OMIM Ref. No. 602223). By Northern blot analysis, Tsukiyama- Kohara et al. (1996) showed that a major 3.5- kb transcript of 4EBP2 is expressed ubiquitously. Tsukiyama- Kohara et al. (1996) analyzed the genomic structure of the mouse EIF4EBP2 gene and showed that it consists of 3 exons and spans 20 kb. Its intron/exon structure is identical to that of EIF4EBP1. Using fluorescence in situ hybridization, Tsukiyama- Kohara et al. (1996) mapped the EIF4EBP2 gene to human chromosome 10q21- q22. They noted that chromosomal alterations in this region have been found in some human cancers. Tsukiyama- Kohara et al. (1996) mapped the mouse 4EBP2 gene to chromosome 10B4- B5.

[23688]

[23689] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23690] Pause, A.; Belsham, G. J.; Gingras, A.- C.; Donze, O.; Lin, T.- A.; Lawrence, J. C., Jr.; Sonenberg, N. : Insulin- dependent stimulation of protein synthesis by phosphorylation of a regulator of 5- prime- cap function. Nature 371: 762- 767, 1994. ; and

[23691] Tsukiyama- Kohara, K.; Vidal, S. M.; Gingras, A.- C.; Glover, T. W.; Hanash, S. M.; Heng, H.; Sonenberg, N. : Tissue distribution, genomic structure, and chromosome mapping of mouse and h.

[23692] Further studies establishing the function and utilities of EIF4EBP2 are found in John Hopkins OMIM database record ID 602224, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eukaryotic translation initiation factor 5 (EIF5, Accession NP_001960.2) is another GAM144 target gene, herein designated TARGET GENE. EIF5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EIF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of EIF5 BINDING SITE, designated SEQ ID:4078, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23693] Another function of GAM144 is therefore inhibition of Eukaryotic translation initiation factor 5 (EIF5, Accession NP_001960.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5.

[23694] Epithelial stromal interaction 1 (breast) (EPSTI1, Accession NP_150280.1) is another GAM144 target gene, herein designated TARGET GENE. EPSTI1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EPSTI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPSTI1 BINDING SITE, designated SEQ ID:846, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23695] Another function of GAM144 is therefore inhibition of Epithelial stromal interaction 1 (breast) (EPSTI1, Accession NP_150280.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPSTI1.

[23696] Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_004091.2) is another GAM144 target gene, herein designated TARGET GENE. EYA4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EYA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA4 BINDING SITE, designated SEQ ID:5938, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23697] Another function of GAM144 is therefore inhibition of Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_004091.2), a gene which may be involved in development of the eye (by similarity). and therefore is associated with Deafness, autosomal dominant nonsyndromic sensorineural 10. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Deafness, autosomal dominant nonsyndromic sensorineural 10, and of other diseases and clinical conditions associated with EYA4.

[23698] The function of EYA4 has been established by previous studies. Borsani et al. (1999) presented the detailed characterization of a fourth vertebrate gene, designated EYA4,

that is homologous to 'eyes absent' (eya), a key regulator of ocular development in Drosophila. See also EYA1 (OMIM Ref. No. 601653), EYA2 (OMIM Ref. No. 601654), and EYA3 (OMIM Ref. No. 601655). The authors found that EYA4 encodes a 640- amino acid protein containing a highly conserved C- terminal domain of 271 amino acids. In Drosophila, eya is known to mediate developmentally important protein- protein interactions. By radiation hybrid analysis and fluorescence in situ hybridization, Borsani et al. (1999) mapped the human EYA4 gene to 6q23. They also detected linkage, with a lod score of greater than 3, to previously mapped reference markers. They genetically mapped the mouse Eya4 gene to chromosome 10 in the vicinity of Aco2 (OMIM Ref. No. 100850), in a region homologous to human chromosome 6q22- q23. In the developing mouse embryo, Eya4 was expressed primarily in the craniofacial mesenchyme, the dermamyotome, and the limb. On the basis of map position and expression pattern, EYA4 was considered a candidate for oculodentodigital dysplasia (OMIM Ref. No. 164200), but Borsani et al. (1999) found no EYA4 mutations in a panel of patients with this disorder. Wayne et al. (2001) identified mutations in the EYA4 gene that were responsible for postlin-

gual, progressive, autosomal dominant hearing loss at the DFNA10 locus (OMIM Ref. No. 601316). Just as EYA proteins interact with members of the SIX (OMIM Ref. No. 601205) and DACH (OMIM Ref. No. 603803) protein families during early embryonic development, the authors suggested that EYA4 is also important postdevelopmentally for continued function of the mature organ of Corti.

[23699]

[23700] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23701] Borsani, G.; DeGrandi, A.; Ballabio, A.; Bulfone, A.; Bernard, L.; Banfi, S.; Gattuso, C.; Mariani, M.; Dixon, M.; Donnai, D.; Metcalfe, K.; Winter, R.; Robertson, M.; Axton, R.; Brown, A.; van Heyningen, V.; Hanson, I. : EYA4, a novel vertebrate gene related to Drosophila eyes absent. Hum. Molec. Genet. 8: 11- 23, 1999. ; and

[23702] Wayne, S.; Robertson, N. G.; DeClau, F.; Chen, N.; Verhoeven, K.; Prasad, S.; Tranebjarg, L.; Morton, C. C.; Ryan, A. F.; Van Camp, G.; Smith, R. J. H. : Mutations in the transcriptiona.

[23703] Further studies establishing the function and utilities of EYA4 are found in John Hopkins OMIM database record ID

603550, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_742101.1) is another GAM144 target gene, herein designated TARGET GENE. EYA4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EYA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA4 BINDING SITE, designated SEQ ID:5938, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23704] Another function of GAM144 is therefore inhibition of Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_742101.1), a gene which may be involved in development of the eye (by similarity). and therefore is associated with Deafness, autosomal dominant nonsyndromic sensorineural 10. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Deafness, autosomal dominant nonsyndromic sensorineural 10, and of other diseases and clinical conditions associated with EYA4.

[23705] The function of EYA4 has been established by previous

studies. Borsani et al. (1999) presented the detailed characterization of a fourth vertebrate gene, designated EYA4, that is homologous to 'eyes absent' (eya), a key regulator of ocular development in Drosophila. See also EYA1 (OMIM Ref. No. 601653), EYA2 (OMIM Ref. No. 601654), and EYA3 (OMIM Ref. No. 601655). The authors found that EYA4 encodes a 640- amino acid protein containing a highly conserved C- terminal domain of 271 amino acids. In Drosophila, eya is known to mediate developmentally important protein- protein interactions. By radiation hybrid analysis and fluorescence in situ hybridization, Borsani et al. (1999) mapped the human EYA4 gene to 6q23. They also detected linkage, with a lod score of greater than 3, to previously mapped reference markers. They genetically mapped the mouse Eya4 gene to chromosome 10 in the vicinity of Aco2 (OMIM Ref. No. 100850), in a region homologous to human chromosome 6q22- q23. In the developing mouse embryo, Eya4 was expressed primarily in the craniofacial mesenchyme, the dermamyotome, and the limb. On the basis of map position and expression pattern, EYA4 was considered a candidate for oculodentodigital dysplasia (OMIM Ref. No. 164200), but Borsani et al. (1999) found no EYA4 mutations in a panel of patients

with this disorder. Wayne et al. (2001) identified mutations in the EYA4 gene that were responsible for postlingual, progressive, autosomal dominant hearing loss at the DFNA10 locus (OMIM Ref. No. 601316). Just as EYA proteins interact with members of the SIX (OMIM Ref. No. 601205) and DACH (OMIM Ref. No. 603803) protein families during early embryonic development, the authors suggested that EYA4 is also important postdevelopmentally for continued function of the mature organ of Corti.

[23706]

[23707] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23708] Borsani, G.; DeGrandi, A.; Ballabio, A.; Bulfone, A.; Bernard, L.; Banfi, S.; Gattuso, C.; Mariani, M.; Dixon, M.; Donnai, D.; Metcalfe, K.; Winter, R.; Robertson, M.; Axton, R.; Brown, A.; van Heyningen, V.; Hanson, I. : EYA4, a novel vertebrate gene related to Drosophila eyes absent. Hum. Molec. Genet. 8: 11- 23, 1999. ; and

[23709] Wayne, S.; Robertson, N. G.; DeClau, F.; Chen, N.; Verhoeven, K.; Prasad, S.; Tranebjarg, L.; Morton, C. C.; Ryan, A. F.; Van Camp, G.; Smith, R. J. H. : Mutations in the transcriptiona.

[23710] Further studies establishing the function and utilities of EYA4 are found in John Hopkins OMIM database record ID 603550, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_742102.1) is another GAM144 target gene, herein designated TARGET GENE. EYA4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EYA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA4 BINDING SITE, designated SEQ ID:5938, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23711] Another function of GAM144 is therefore inhibition of Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_742102.1), a gene which may be involved in development of the eye (by similarity). and therefore is associated with Deafness, autosomal dominant nonsyndromic sensorineural 10. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Deafness, autosomal dominant nonsyndromic sensorineural 10, and of other

diseases and clinical conditions associated with EYA4.

[23712] The function of EYA4 has been established by previous studies. Borsani et al. (1999) presented the detailed characterization of a fourth vertebrate gene, designated EYA4, that is homologous to 'eyes absent' (eya), a key regulator of ocular development in Drosophila. See also EYA1 (OMIM Ref. No. 601653), EYA2 (OMIM Ref. No. 601654), and EYA3 (OMIM Ref. No. 601655). The authors found that EYA4 encodes a 640- amino acid protein containing a highly conserved C- terminal domain of 271 amino acids. In Drosophila, eya is known to mediate developmentally important protein- protein interactions. By radiation hybrid analysis and fluorescence in situ hybridization, Borsani et al. (1999) mapped the human EYA4 gene to 6q23. They also detected linkage, with a lod score of greater than 3, to previously mapped reference markers. They genetically mapped the mouse Eya4 gene to chromosome 10 in the vicinity of Aco2 (OMIM Ref. No. 100850), in a region homologous to human chromosome 6q22- q23. In the developing mouse embryo, Eya4 was expressed primarily in the craniofacial mesenchyme, the dermamyotome, and the limb. On the basis of map position and expression pattern, EYA4 was considered a candidate for oculoden-

todigital dysplasia (OMIM Ref. No. 164200), but Borsani et al. (1999) found no EYA4 mutations in a panel of patients with this disorder. Wayne et al. (2001) identified mutations in the EYA4 gene that were responsible for postlingual, progressive, autosomal dominant hearing loss at the DFNA10 locus (OMIM Ref. No. 601316). Just as EYA proteins interact with members of the SIX (OMIM Ref. No. 601205) and DACH (OMIM Ref. No. 603803) protein families during early embryonic development, the authors suggested that EYA4 is also important postdevelopmentally for continued function of the mature organ of Corti.

[23713]

[23714] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23715] Borsani, G.; DeGrandi, A.; Ballabio, A.; Bulfone, A.; Bernard, L.; Banfi, S.; Gattuso, C.; Mariani, M.; Dixon, M.; Donnai, D.; Metcalfe, K.; Winter, R.; Robertson, M.; Axton, R.; Brown, A.; van Heyningen, V.; Hanson, I. : EYA4, a novel vertebrate gene related to Drosophila eyes absent. Hum. Molec. Genet. 8: 11- 23, 1999. ; and

[23716] Wayne, S.; Robertson, N. G.; DeClau, F.; Chen, N.; Verhoeven, K.; Prasad, S.; Tranebjarg, L.; Morton, C. C.; Ryan, A.

F.; Van Camp, G.; Smith, R. J. H. : Mutations in the transcriptiona.

[23717] Further studies establishing the function and utilities of EYA4 are found in John Hopkins OMIM database record ID 603550, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_742103.1) is another GAM144 target gene, herein designated TARGET GENE. EYA4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EYA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA4 BINDING SITE, designated SEQ ID:5938, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23718] Another function of GAM144 is therefore inhibition of Eyes absent homolog 4 (drosophila) (EYA4, Accession NP_742103.1), a gene which may be involved in development of the eye (by similarity). and therefore is associated with Deafness, autosomal dominant nonsyndromic sensorineural 10. Accordingly, utilities of GAM144 include di-

agnosis, prevention and treatment of Deafness, autosomal dominant nonsyndromic sensorineural 10, and of other diseases and clinical conditions associated with EYA4.

[23719] The function of EYA4 has been established by previous studies. Borsani et al. (1999) presented the detailed characterization of a fourth vertebrate gene, designated EYA4, that is homologous to 'eyes absent' (eya), a key regulator of ocular development in Drosophila. See also EYA1 (OMIM Ref. No. 601653), EYA2 (OMIM Ref. No. 601654), and EYA3 (OMIM Ref. No. 601655). The authors found that EYA4 encodes a 640- amino acid protein containing a highly conserved C- terminal domain of 271 amino acids. In Drosophila, eya is known to mediate developmentally important protein- protein interactions. By radiation hybrid analysis and fluorescence in situ hybridization, Borsani et al. (1999) mapped the human EYA4 gene to 6q23. They also detected linkage, with a lod score of greater than 3, to previously mapped reference markers. They genetically mapped the mouse Eya4 gene to chromosome 10 in the vicinity of Aco2 (OMIM Ref. No. 100850), in a region homologous to human chromosome 6q22- q23. In the developing mouse embryo, Eya4 was expressed primarily in the craniofacial mesenchyme, the dermamyotome, and

the limb. On the basis of map position and expression pattern, EYA4 was considered a candidate for oculodentodigital dysplasia (OMIM Ref. No. 164200), but Borsani et al. (1999) found no EYA4 mutations in a panel of patients with this disorder. Wayne et al. (2001) identified mutations in the EYA4 gene that were responsible for postlingual, progressive, autosomal dominant hearing loss at the DFNA10 locus (OMIM Ref. No. 601316). Just as EYA proteins interact with members of the SIX (OMIM Ref. No. 601205) and DACH (OMIM Ref. No. 603803) protein families during early embryonic development, the authors suggested that EYA4 is also important postdevelopmentally for continued function of the mature organ of Corti. [23720]

[23721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23722] Borsani, G.; DeGrandi, A.; Ballabio, A.; Bulfone, A.; Bernard, L.; Banfi, S.; Gattuso, C.; Mariani, M.; Dixon, M.; Donnai, D.; Metcalfe, K.; Winter, R.; Robertson, M.; Axton, R.; Brown, A.; van Heyningen, V.; Hanson, I. : EYA4, a novel vertebrate gene related to Drosophila eyes absent. Hum. Molec. Genet. 8: 11- 23, 1999. ; and

[23723] Wayne, S.; Robertson, N. G.; DeClau, F.; Chen, N.; Verhoeven, K.; Prasad, S.; Tranebjarg, L.; Morton, C. C.; Ryan, A. F.; Van Camp, G.; Smith, R. J. H. : Mutations in the transcriptiona.

[23724] Further studies establishing the function and utilities of EYA4 are found in John Hopkins OMIM database record ID 603550, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fatty-acid-coenzyme a ligase, long-chain 1 (FACL1, Accession NP_001986.1) is another GAM144 target gene, herein designated TARGET GENE. FACL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FACL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL1 BINDING SITE, designated SEQ ID:7139, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23725] Another function of GAM144 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 1 (FACL1, Accession NP_001986.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with FACL1.

[23726] Fatty-acid-coenzyme a ligase, long-chain 2 (FACL2, Accession NP_066945.1) is another GAM144 target gene, herein designated TARGET GENE. FACL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FACL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL2 BINDING SITE, designated SEQ ID:7139, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23727] Another function of GAM144 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 2 (FACL2, Accession NP_066945.1), a gene which activates long- chain fatty acids for both synthesis of cellular lipids. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL2.

[23728] The function of FACL2 has been established by previous studies. See 152425. Minoshima et al. (1991) isolated a human cDNA for a long- chain acyl- CoA synthetase from a human liver cDNA library using the rat cDNA as a probe.

Using flow- sorted human chromosomes, they demonstrated that the gene, now designated FACL2, is located on human chromosome 4. Cantu et al. (1995) mapped FACL2 to 4q34- q35 by fluorescence in situ hybridization.

[23729]

[23730] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23731] Cantu, E. S.; Sprinkle, T. J.; Ghosh, B.; Singh, I. : The human palmitoyl- CoA ligase (FACL2) gene maps to the chromosome 4q34- q35 region by fluorescence in situ hybridization (FISH) and somatic cell hybrid panels. Genomics 28: 600- 602, 1995. ; and

[23732] Minoshima, S.; Fukuyama, R.; Yamamoto, T.; Shimizu, N. : Mapping of human long- chain acyl- CoA synthetase to chromosome 4. (Abstract) Cytogenet. Cell Genet. 58: 1888 only, 1991.

[23733] Further studies establishing the function and utilities of FACL2 are found in John Hopkins OMIM database record ID 152426, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fanconi anemia, complementation group a (FANCA, Accession NP_000126.1) is another GAM144 target gene, herein

designated TARGET GENE. FANCA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FANCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FANCA BINDING SITE, designated SEQ ID:5437, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23734] Another function of GAM144 is therefore inhibition of Fanconi anemia, complementation group a (FANCA, Accession NP_000126.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCA.

[23735] Fibroblast growth factor 23 (FGF23, Accession NP_065689.1) is another GAM144 target gene, herein designated TARGET GENE. FGF23 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FGF23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF23 BINDING SITE, designated SEQ ID:15801, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ

ID:361.

[23736] Another function of GAM144 is therefore inhibition of Fibroblast growth factor 23 (FGF23, Accession NP_065689.1), a gene which a member of the fibroblast growth factor family . and therefore is associated with Autosomal dominant hypophosphatemic rickets . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Autosomal dominant hypophosphatemic rickets ., and of other diseases and clinical conditions associated with FGF23.

[23737] The function of FGF23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.FLJ00001 (Accession XP_088525.2) is another GAM144 target gene, herein designated TARGET GENE. FLJ00001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:6835, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23738] Another function of GAM144 is therefore inhibition of FLJ00001 (Accession XP_088525.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001.

[23739] FLJ00024 (Accession NP_203745.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ00024 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:18861, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23740] Another function of GAM144 is therefore inhibition of FLJ00024 (Accession NP_203745.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[23741] FLJ00024 (Accession XP_033361.2) is another GAM144 target gene, herein designated TARGET GENE. FLJ00024

BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:18861, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23742] Another function of GAM144 is therefore inhibition of FLJ00024 (Accession XP_033361.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[23743] FLJ10450 (Accession NP_060565.2) is another GAM144 target gene, herein designated TARGET GENE. FLJ10450 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10450 BINDING SITE, designated SEQ ID:11597, to the nucleotide sequence of GAM144 RNA, herein designated

GAM RNA, also designated SEQ ID:361.

[23744] Another function of GAM144 is therefore inhibition of FLJ10450 (Accession NP_060565.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10450.

[23745] FLJ11036 (Accession NP_060776.2) is another GAM144 target gene, herein designated TARGET GENE. FLJ11036 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ11036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11036 BINDING SITE, designated SEQ ID:14811, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23746] Another function of GAM144 is therefore inhibition of FLJ11036 (Accession NP_060776.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11036.

[23747] FLJ12488 (Accession NP_112495.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ12488

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12488, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12488 BINDING SITE, designated SEQ ID:17886, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23748] Another function of GAM144 is therefore inhibition of FLJ12488 (Accession NP_112495.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12488.

[23749] FLJ12552 (Accession NP_073743.2) is another GAM144 target gene, herein designated TARGET GENE. FLJ12552 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12552, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12552 BINDING SITE, designated SEQ ID:9222, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23750] Another function of GAM144 is therefore inhibition of FLJ12552 (Accession NP_073743.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12552.

[23751] FLJ13204 (Accession NP_079037.2) is another GAM144 target gene, herein designated TARGET GENE. FLJ13204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:4763, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23752] Another function of GAM144 is therefore inhibition of FLJ13204 (Accession NP_079037.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204.

[23753] FLJ13441 (Accession NP_076413.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ13441 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ13441, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:7854, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23754] Another function of GAM144 is therefore inhibition of FLJ13441 (Accession NP_076413.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441.

[23755] FLJ13848 (Accession NP_079047.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ13848 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13848, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:1687, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23756] Another function of GAM144 is therefore inhibition of

FLJ13848 (Accession NP_079047.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848.

[23757] FLJ14106 (Accession NP_079343.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ14106 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ14106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14106 BINDING SITE, designated SEQ ID:589, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23758] Another function of GAM144 is therefore inhibition of FLJ14106 (Accession NP_079343.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14106.

[23759] FLJ14457 (Accession NP_116177.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ14457 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14457, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14457 BINDING SITE, designated SEQ ID:11171, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23760] Another function of GAM144 is therefore inhibition of FLJ14457 (Accession NP_116177.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14457.

[23761] FLJ20413 (Accession NP_060278.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ20413 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20413, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated SEQ ID:4973, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23762] Another function of GAM144 is therefore inhibition of FLJ20413 (Accession NP_060278.1) . Accordingly, utilities

of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413.

[23763] FLJ20436 (Accession NP_060292.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ20436 BINDING SITE1 and FLJ20436 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ20436, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20436 BINDING SITE1 and FLJ20436 BINDING SITE2, designated SEQ ID:12137 and SEQ ID:15533 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23764] Another function of GAM144 is therefore inhibition of FLJ20436 (Accession NP_060292.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20436.

[23765] FLJ20487 (Accession NP_060311.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ20487 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ20487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20487 BINDING SITE, designated SEQ ID:13148, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23766] Another function of GAM144 is therefore inhibition of FLJ20487 (Accession NP_060311.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20487.

[23767] FLJ20489 (Accession NP_060312.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ20489 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20489, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20489 BINDING SITE, designated SEQ ID:14840, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23768] Another function of GAM144 is therefore inhibition of

FLJ20489 (Accession NP_060312.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20489.

[23769] FLJ20626 (Accession NP_060378.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ20626 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20626, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20626 BINDING SITE, designated SEQ ID:17489, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23770] Another function of GAM144 is therefore inhibition of FLJ20626 (Accession NP_060378.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20626.

[23771] FLJ21135 (Accession NP_079142.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ21135 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21135, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21135 BINDING SITE, designated SEQ ID:7806, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23772] Another function of GAM144 is therefore inhibition of FLJ21135 (Accession NP_079142.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21135.

[23773] FLJ22059 (Accession NP_073589.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ22059 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22059, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22059 BINDING SITE, designated SEQ ID:12358, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23774] Another function of GAM144 is therefore inhibition of FLJ22059 (Accession NP_073589.1) . Accordingly, utilities

of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22059.

[23775] FLJ22419 (Accession NP_078973.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ22419 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22419, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22419 BINDING SITE, designated SEQ ID:13241, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23776] Another function of GAM144 is therefore inhibition of FLJ22419 (Accession NP_078973.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22419.

[23777] FLJ31657 (Accession NP_689971.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ31657 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31657, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31657 BINDING SITE, designated SEQ ID:19250, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23778] Another function of GAM144 is therefore inhibition of FLJ31657 (Accession NP_689971.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31657.

[23779] FLJ33790 (Accession NP_775854.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ33790 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33790, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33790 BINDING SITE, designated SEQ ID:8915, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23780] Another function of GAM144 is therefore inhibition of FLJ33790 (Accession NP_775854.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ33790.

[23781] FLJ33996 (Accession NP_787090.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ33996 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33996, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33996 BINDING SITE, designated SEQ ID:639, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23782] Another function of GAM144 is therefore inhibition of FLJ33996 (Accession NP_787090.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33996.

[23783] FLJ36674 (Accession NP_775893.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ36674 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36674, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ36674 BINDING SITE, designated SEQ ID:18877, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23784] Another function of GAM144 is therefore inhibition of FLJ36674 (Accession NP_775893.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36674.

[23785] FLJ37078 (Accession NP_694588.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ37078 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37078 BINDING SITE, designated SEQ ID:18330, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23786] Another function of GAM144 is therefore inhibition of FLJ37078 (Accession NP_694588.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ37078.

[23787] FLJ38984 (Accession NP_689587.1) is another GAM144 target gene, herein designated TARGET GENE. FLJ38984 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38984, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38984 BINDING SITE, designated SEQ ID:3780, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23788] Another function of GAM144 is therefore inhibition of FLJ38984 (Accession NP_689587.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38984.

[23789] Fucosyltransferase 7 (alpha (1,3) fucosyltransferase) (FUT7, Accession NP_004470.1) is another GAM144 target gene, herein designated TARGET GENE. FUT7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of FUT7 BINDING SITE, designated SEQ ID:7584, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23790] Another function of GAM144 is therefore inhibition of Fucosyltransferase 7 (alpha (1,3) fucosyltransferase) (FUT7, Accession NP_004470.1), a gene which may catalyze alpha- 1,3 glycosidic linkages involved in the expression of sialyl lewis x antigens. and therefore may be associated with Ulcer disease. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Ulcer disease., and of other diseases and clinical conditions associated with FUT7.

[23791] The function of FUT7 has been established by previous studies. The sialyl Lewis x oligosaccharide determinant is an essential component of leukocyte counterreceptors for E- selectin- (OMIM Ref. No. 131210) and P- selectin- (OMIM Ref. No. 173610) mediated adhesions of leukocytes. This oligosaccharide molecule is displayed on the surfaces of granulocytes, monocytes, and natural killer cells. Formation of leukocyte adhesions to these selectins is an early and important step in the process that ultimately allows leukocytes to leave the vascular tree and

become recruited into lymphoid tissues and sites of inflammation. Bengtson et al. (2001) identified 3 individuals who were heterozygous for a 326G- A point mutation (arg110 to gln) in the FUT7 gene. Screening of family members revealed a homozygote for the mutation. Neutrophils isolated from individuals carrying the mutation showed lowered expression of SLeX and elevated expression of CD65 compared to controls. The homozygous individual was found to have ulcer disease, noninsulin- dependent diabetes, osteoporosis, spondyloarthrosis, and Sjogren syndrome, but the relationship between disease and the mutation was not clear. Bengtson et al. (2001) determined that the mutation causes loss of function. Biochemical analysis of lysates obtained from COS- 7 cells transiently transfected with the mutated FUT7 construct revealed no FUT7 activity, and immunocytochemical visualization revealed no SLeX on the surface of these cells.

[23792]

[23793] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23794] Bengtson, P.; Larson, C.; Lundblad, A.; Larson, G.; Pahlsson, P. : Identification of a missense mutation (G329A;

arg110- to- gln) in the human FUT7 gene. J. Biol. Chem. 276: 31575- 31582, 2001. ; and

[23795] Mahdavi, J.; Sonden, B.; Hurtig, M.; Olfat, F. O.; Forsberg, L.; Roche, N.; Angstrom, J.; Larsson, T.; Teneberg, S.; Karlsson, K.- A.; Altraja, S.; Wadstrom, T.; and 11 others : Helicob.

[23796] Further studies establishing the function and utilities of FUT7 are found in John Hopkins OMIM database record ID 602030, and in cited publications listed in Table 5, which are hereby incorporated by reference.Growth hormone inducible transmembrane protein (GHITM, Accession NP_055209.1) is another GAM144 target gene, herein designated TARGET GENE. GHITM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GHITM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GHITM BINDING SITE, designated SEQ ID:18194, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23797] Another function of GAM144 is therefore inhibition of Growth hormone inducible transmembrane protein

(GHITM, Accession NP_055209.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHITM.

[23798] GIOT-2 (Accession NP_057348.1) is another GAM144 target gene, herein designated TARGET GENE. GIOT-2 BINDING SITE1 and GIOT-2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GIOT-2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GIOT-2 BINDING SITE1 and GIOT-2 BINDING SITE2, designated SEQ ID:6079 and SEQ ID:11250 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23799] Another function of GAM144 is therefore inhibition of GIOT-2 (Accession NP_057348.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIOT-2.

[23800] Golgi autoantigen, golgin subfamily a, 1 (GOLGA1, Accession NP_002068.1) is another GAM144 target gene, herein designated TARGET GENE. GOLGA1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GOLGA1, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:11331, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23801] Another function of GAM144 is therefore inhibition of Golgi autoantigen, golgin subfamily a, 1 (GOLGA1, Accession NP_002068.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1.

[23802] GOR (Accession NP_758439.1) is another GAM144 target gene, herein designated TARGET GENE. GOR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GOR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOR BINDING SITE, designated SEQ ID:13612, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23803] Another function of GAM144 is therefore inhibition of GOR (Accession NP_758439.1) . Accordingly, utilities of

GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOR.

[23804] GREB1 (Accession NP_683701.1) is another GAM144 target gene, herein designated TARGET GENE. GREB1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GREB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:8571, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23805] Another function of GAM144 is therefore inhibition of GREB1 (Accession NP_683701.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1.

[23806] Glutamate receptor, ionotropic, n-methyl d-aspartate-associated protein 1 (glutamate binding) (GRINA, Accession XP_291268.1) is another GAM144 target gene, herein designated TARGET GENE. GRINA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRINA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRINA BINDING SITE, designated SEQ ID:12280, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23807] Another function of GAM144 is therefore inhibition of Glutamate receptor, ionotropic, n-methyl d-aspartate-associated protein 1 (glutamate binding) (GRINA, Accession XP_291268.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRINA.

[23808] GRTP1 (Accession NP_078995.1) is another GAM144 target gene, herein designated TARGET GENE. GRTP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRTP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRTP1 BINDING SITE, designated SEQ ID:11191, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23809] Another function of GAM144 is therefore inhibition of GRTP1 (Accession NP_078995.1) . Accordingly, utilities of

GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRTP1.

[23810] HES2 (Accession XP_290879.1) is another GAM144 target gene, herein designated TARGET GENE. HES2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HES2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HES2 BINDING SITE, designated SEQ ID:17870, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23811] Another function of GAM144 is therefore inhibition of HES2 (Accession XP_290879.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HES2.

[23812] Holocarboxylase synthetase (biotin-[proprionyl-coenzyme a-carboxylase (atp-hydrolysing)] ligase) (HLCS, Accession NP_000402.2) is another GAM144 target gene, herein designated TARGET GENE. HLCS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HLCS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:13731, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23813] Another function of GAM144 is therefore inhibition of Holocarboxylase synthetase (biotin-[proprionyl-coenzyme a-carboxylase (atp-hydrolysing)] ligase) (HLCS, Accession NP_000402.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS.

[23814] Homeo box c9 (HOXC9, Accession NP_008828.1) is another GAM144 target gene, herein designated TARGET GENE. HOXC9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXC9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXC9 BINDING SITE, designated SEQ ID:18430, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23815] Another function of GAM144 is therefore inhibition of

Homeo box c9 (HOXC9, Accession NP_008828.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC9.

[23816] HSPC129 (Accession NP_057480.1) is another GAM144 target gene, herein designated TARGET GENE. HSPC129 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC129, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC129 BINDING SITE, designated SEQ ID:14145, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23817] Another function of GAM144 is therefore inhibition of HSPC129 (Accession NP_057480.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC129.

[23818] Insulin-like growth factor 2, antisense (IGF2AS, Accession NP_057496.1) is another GAM144 target gene, herein designated TARGET GENE. IGF2AS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by IGF2AS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF2AS BINDING SITE, designated SEQ ID:16566, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23819] Another function of GAM144 is therefore inhibition of Insulin-like growth factor 2, antisense (IGF2AS, Accession NP_057496.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2AS.

[23820] Inositol hexaphosphate kinase 2 (IHPK2, Accession NP_057375.1) is another GAM144 target gene, herein designated TARGET GENE. IHPK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IHPK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IHPK2 BINDING SITE, designated SEQ ID:9050, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23821] Another function of GAM144 is therefore inhibition of In-

ositol hexaphosphate kinase 2 (IHPK2, Accession NP_057375.1), a gene which may act as energy reserves in selected intracellular sites. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK2.

[23822] The function of IHPK2 has been established by previous studies. Inositol trisphosphate is a messenger molecule that releases calcium from intracellular stores. Homologs with multiple phosphates, including pyrophosphates, have also been identified. Inositol pyrophosphates are formed by several enzymes, including IHPK2. By database screening for homologs of rat Ihpk1 (OMIM Ref. No. 606991), Saiardi et al. (1999) obtained a cDNA encoding IHPK2, which had been called PiUS because it stimulates the uptake of inorganic phosphate but lacks transporter features. The deduced 426- amino acid protein is 98% identical to the rabbit protein and 48% identical to mouse Ihpk1. It contains a 25- residue conserved sequence also found in ITPKA (OMIM Ref. No. 147521), ITPKB (OMIM Ref. No. 147522), and 2 yeast proteins. Western blot analysis showed expression of a 49- kD protein. Northern blot analysis revealed high- level expression of a 1.9- kb transcript in mouse brain and lung, with lower levels in liver,

kidney, and testis. Using confocal microscopy, Saiardi et al. (2001) demonstrated that mouse Ihpk1 is present in both the nucleus and the cytoplasm, whereas IHPK2 is almost exclusively nuclear and IHPK3 (OMIM Ref. No. 606993) is predominantly cytoplasmic. Saiardi et al. (1999) showed that cells expressing IHPK2 displayed robust InsP6 kinase activity. They proposed that IHPK1 and IHPK2 may act as energy reserves in selected intracellular sites. Morrison et al. (2002) showed that IHPK2 expression leads to a reduction of colony- forming cells, while overexpression causes increased radiosensitivity. Exposure to beta- interferon (IFNB; 147640) or radiation induced caspase- 8 (CASP8; 601763), but only IFNB induced TRAIL (TNFSF10; 603598), and only radiation induced DR4 (TNFRSF10A; 603611). The apoptotic effects of these treatments could be blocked by a dominant- negative mutant of the TRAIL receptor DR5 (TNFRSF10B; 603612) or by BCL2 (OMIM Ref. No. 151430). Morrison et al. (2002) concluded that IHPK2 expression enhances sensitivity of some ovarian carcinomas to interferon and radiation treatment. Furthermore, they proposed that IHPK2 functions to enhance the expression of CASP8 through different extrinsic receptor- mediated pathways.

[23823]

[23824] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23825] Morrison, B. H.; Bauer, J. A.; Hu, J.; Grane, R. W.; Ozdemir, A. M.; Chawla- Sarkar, M.; Gong, B.; Almasan, A.; Kalvakolanu, D. V.; Lindner, D. J. : Inositol hexakisphos- phate kinase 2 sensitizes ovarian carcinoma cells to mul- tiple cancer therapeutics. Oncogene 21: 1882- 1889, 2002. ; and

[23826] Saiardi, A.; Erdjument- Bromage, H.; Snowman, A. M.; Tempst, P.; Snyder, S. H. : Synthesis of diphosphoinositol pentakisphosphate by a newly identified family of higher inositol polypho.

[23827] Further studies establishing the function and utilities of IHPK2 are found in John Hopkins OMIM database record ID 606992, and in cited publications listed in Table 5, which are hereby incorporated by reference.Inositol 1,4,5-trisphosphate 3-kinase b (ITPKB, Accession NP_002212.1) is another GAM144 target gene, herein designated TARGET GENE. ITPKB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITPKB, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:2633, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23828] Another function of GAM144 is therefore inhibition of Inositol 1,4,5-trisphosphate 3-kinase b (ITPKB, Accession NP_002212.1), a gene which is a type B inositol 1,4,5-triphosphate 3 kinase. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB.

[23829] The function of ITPKB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Potassium large conductance calcium-activated channel, subfamily m, beta member 4 (KCNMB4, Accession NP_055320.4) is another GAM144 target gene, herein designated TARGET GENE. KCNMB4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNMB4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNMB4 BIND-

ING SITE, designated SEQ ID:13644, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23830] Another function of GAM144 is therefore inhibition of Potassium large conductance calcium-activated channel, subfamily m, beta member 4 (KCNMB4, Accession NP_055320.4), a gene which regulates gating kinetics of slow K channels in a Ca- sensitive manner. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB4.

[23831] The function of KCNMB4 has been established by previous studies. The large conductance, calcium- activated potassium (BK) channel is a member of the Shaker- related 6-transmembrane domain potassium channel superfamily that is sensitive to voltage and calcium. BK channels are composed of a pore- forming alpha subunit (KCNMA1, or HSLO; 600150) and, in some tissues, a beta subunit. The beta- 1 subunit (KCNMB1; 603951) is expressed predominantly in smooth muscle cells, whereas the beta- 2 subunit (KCNMB2; 605214) is expressed in endocrine tissue, such as adrenal chromaffin cells. By searching EST databases, Behrens et al. (2000) and Brenner et al. (2000)

identified cDNAs encoding KCNMB4. Sequence analysis predicted that the 210- amino acid KCNMB4 protein contains 2 conserved transmembrane domains and an extracellular domain containing an N- glycosylation site and 4 cys residues; however, like KCNMB3 (OMIM Ref. No. 605222), KCNMB4 lacks the putative charybdotoxin/iberiotoxin- binding site. RNA dot blot analysis by Behrens et al. (2000) revealed high and specific expression of KCNMB4 in central nervous system tissue, with no expression in nonneuronal tissue. Northern blot analysis by Behrens et al. (2000) and Brenner et al. (2000) detected major 1.9- and minor 3.0- and 6.1- kb KCNMB4 transcripts in all brain tissues. Functional analysis of the effects of KCNMB4 on KCNMA1 showed that KCNMB4 slows activation kinetics, leads to steeper calcium sensitivity, and shifts the voltage range of BK current activation to more negative potentials than does KCNMB1. KCNMA1/KCNMB4 channels were not blocked by charybdotoxin or iberiotoxin and were activated by 17- beta-estradiol (Behrens et al., 2000). By electronic PCR, Behrens et al. (2000) mapped the KCNMB4 gene to 12q14.1- q15 [23832]

[23833] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[23834] Behrens, R.; Nolting, A.; Reimann, F.; Schwarz, M.; Waldschutz, R.; Pongs, O. : hKCNMB3 and hKCNMB4, cloning and characterization of two members of the large- conductance calcium- activated potassium channel beta subunit family. FEBS Lett. 474: 99- 106, 2000. ; and

[23835] Brenner, R.; Jegla, T. J.; Wickenden, A.; Liu, Y.; Aldrich, R. W. : Cloning and functional characterization of novel large conductance calcium- activated potassium channel beta subunits.

[23836] Further studies establishing the function and utilities of KCNMB4 are found in John Hopkins OMIM database record ID 605223, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0194 (Accession XP_038362.3) is another GAM144 target gene, herein designated TARGET GENE. KIAA0194 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0194, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0194 BINDING SITE, designated SEQ ID:12459, to the nucleotide

sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23837] Another function of GAM144 is therefore inhibition of KIAA0194 (Accession XP_038362.3) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0194.

[23838] KIAA0196 (Accession NP_055661.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA0196 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0196, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0196 BINDING SITE, designated SEQ ID:8741, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23839] Another function of GAM144 is therefore inhibition of KIAA0196 (Accession NP_055661.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0196.

[23840] KIAA0258 (Accession NP_055600.1) is another GAM144

target gene, herein designated TARGET GENE. KIAA0258 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:7237, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23841] Another function of GAM144 is therefore inhibition of KIAA0258 (Accession NP_055600.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258.

[23842] KIAA0469 (Accession NP_055666.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA0469 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:18243, to the nucleotide sequence of GAM144 RNA, herein designated

GAM RNA, also designated SEQ ID:361.

[23843] Another function of GAM144 is therefore inhibition of KIAA0469 (Accession NP_055666.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469.

[23844] KIAA0557 (Accession XP_085507.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA0557 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:15943, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23845] Another function of GAM144 is therefore inhibition of KIAA0557 (Accession XP_085507.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557.

[23846] KIAA0773 (Accession NP_055505.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA0773

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0773, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0773 BINDING SITE, designated SEQ ID:7991, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23847] Another function of GAM144 is therefore inhibition of KIAA0773 (Accession NP_055505.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0773.

[23848] KIAA0971 (Accession NP_055744.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA0971 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0971 BINDING SITE, designated SEQ ID:4116, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23849] Another function of GAM144 is therefore inhibition of KIAA0971 (Accession NP_055744.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0971.

[23850] KIAA0987 (Accession NP_036439.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA0987 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0987 BINDING SITE, designated SEQ ID:19005, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23851] Another function of GAM144 is therefore inhibition of KIAA0987 (Accession NP_036439.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0987.

[23852] KIAA1054 (Accession XP_043493.5) is another GAM144 target gene, herein designated TARGET GENE. KIAA1054 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1054, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:19444, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23853] Another function of GAM144 is therefore inhibition of KIAA1054 (Accession XP_043493.5) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054.

[23854] KIAA1210 (Accession XP_172801.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA1210 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1210, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE, designated SEQ ID:3392, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23855] Another function of GAM144 is therefore inhibition of

KIAA1210 (Accession XP_172801.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210.

[23856] KIAA1317 (Accession XP_098368.2) is another GAM144 target gene, herein designated TARGET GENE. KIAA1317 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1317, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:15868, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23857] Another function of GAM144 is therefore inhibition of KIAA1317 (Accession XP_098368.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317.

[23858] KIAA1340 (Accession XP_044836.2) is another GAM144 target gene, herein designated TARGET GENE. KIAA1340 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1340, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:10596, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23859] Another function of GAM144 is therefore inhibition of KIAA1340 (Accession XP_044836.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340.

[23860] KIAA1377 (Accession XP_040708.2) is another GAM144 target gene, herein designated TARGET GENE. KIAA1377 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1377, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1377 BINDING SITE, designated SEQ ID:2469, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23861] Another function of GAM144 is therefore inhibition of KIAA1377 (Accession XP_040708.2) . Accordingly, utilities

of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1377.

[23862] KIAA1822 (Accession XP_041566.2) is another GAM144 target gene, herein designated TARGET GENE. KIAA1822 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1822, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:4193, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23863] Another function of GAM144 is therefore inhibition of KIAA1822 (Accession XP_041566.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822.

[23864] KIAA1908 (Accession XP_055834.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA1908 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1908, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:12359, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23865] Another function of GAM144 is therefore inhibition of KIAA1908 (Accession XP_055834.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908.

[23866] KIAA1920 (Accession XP_085210.1) is another GAM144 target gene, herein designated TARGET GENE. KIAA1920 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1920 BINDING SITE, designated SEQ ID:8934, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23867] Another function of GAM144 is therefore inhibition of KIAA1920 (Accession XP_085210.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1920.

[23868] Ladinin 1 (LAD1, Accession NP_005549.2) is another GAM144 target gene, herein designated TARGET GENE. LAD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAD1 BINDING SITE, designated SEQ ID:13558, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23869] Another function of GAM144 is therefore inhibition of Ladinin 1 (LAD1, Accession NP_005549.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAD1.

[23870] Lim domain binding 2 (LDB2, Accession NP_001281.1) is another GAM144 target gene, herein designated TARGET GENE. LDB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LDB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of LDB2 BINDING SITE, designated SEQ ID:8958, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23871] Another function of GAM144 is therefore inhibition of Lim domain binding 2 (LDB2, Accession NP_001281.1), a gene which physically interacts with the LIM domains of nuclear proteins. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDB2.

[23872] The function of LDB2 has been established by previous studies. Genes encoding LIM domain- binding factors were initially isolated in a screen for proteins that physically interact with the LIM domains of nuclear proteins. These proteins are capable of binding to a variety of transcription factors and are likely to function at enhancers to bring together diverse transcription factors and form higher order activation complexes or to block formation of such complexes (Jurata and Gill, 1997). The family of genes encoding LIM domain- binding factors includes 2 members isolated from the mouse, Clim1 (Bach et al., 1997) and Clim2/Lbd1/Nli (Agulnick et al., 1996; Jurata et al., 1996; Bach et al., 1997) and their homologs cloned

from the frog, chicken, and fly. The fact that LIM domain-binding factors are likely to be involved in the coordination of the transcriptional activity of many diverse factors might implicate them in human phenotypes characterized by multiple affected sites. Semina et al. (1998) cloned the human genes CLIM1 and CLIM2 (OMIM Ref. No. 603451). They identified human sequences homologous to the mouse gene encoding Nli/Lbd1 in the EST database. Human sequences homologous to both Clim1 and Clim2 proteins were found. To obtain full- length cDNA clones for both genes, they screened a human craniofacial cDNA library with the corresponding human clones. The CLIM1 composite cDNA was found to be 2,351 bp long; the CLIM2 composite cDNA was found to be 1,953 bp long. The genes encode proteins of similar size, 373 and 375 amino acids, respectively. The proteins show a very high degree of identity with their homologs from other species as well as with each other. Using the Genebridge 4 radiation hybrid panel, Semina et al. (1998) mapped the CLIM1 and CLIM2 genes. CLIM1 was localized to 4p16- p15 and the map position was refined to 4p15 with a regional mapping panel for human chromosome 4. CLIM2 was localized to 10q24- q25; this region shares homology with

the distal region of mouse chromosome 19, where the mouse gene Lbd1 was mapped by Yamashita et al. (1998).

[23873]

[23874] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23875] Semina, E. V.; Altherr, M. R.; Murray, J. C. : Cloning and chromosomal localization of two novel human genes encoding LIM- domain binding factors CLIM1 and CLIM2/LDB1/NL1. Mammalian Genome 9: 921- 924, 1998. ; and

[23876] Yamashita, T.; Agulnick, A. D.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Westphal, H. : Genomic structure and chromosomal localization of the mouse LIM domain-binding protein 1 g.

[23877] Further studies establishing the function and utilities of LDB2 are found in John Hopkins OMIM database record ID 603450, and in cited publications listed in Table 5, which are hereby incorporated by reference.Lectin, galactoside-binding, soluble, 9 (galectin 9) (LGALS9, Accession NP_002299.1) is another GAM144 target gene, herein designated TARGET GENE. LGALS9 BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by LGALS9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGALS9 BINDING SITE, designated SEQ ID:13678, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23878] Another function of GAM144 is therefore inhibition of Lectin, galactoside-binding, soluble, 9 (galectin 9) (LGALS9, Accession NP_002299.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGALS9.

[23879] Lectin, galactoside-binding, soluble, 9 (galectin 9) (LGALS9, Accession NP_033665.1) is another GAM144 target gene, herein designated TARGET GENE. LGALS9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LGALS9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGALS9 BINDING SITE, designated SEQ ID:13678, to the nucleotide sequence of GAM144

RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23880] Another function of GAM144 is therefore inhibition of Lectin, galactoside-binding, soluble, 9 (galectin 9) (LGALS9, Accession NP_033665.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGALS9.

[23881] Leukocyte immunoglobulin-like receptor, subfamily b (with tm and itim domains), member 3 (LILRB3, Accession NP_006855.1) is another GAM144 target gene, herein designated TARGET GENE. LILRB3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LILRB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LILRB3 BINDING SITE, designated SEQ ID:19524, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23882] Another function of GAM144 is therefore inhibition of Leukocyte immunoglobulin-like receptor, subfamily b (with tm and itim domains), member 3 (LILRB3, Accession

NP_006855.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRB3.

[23883] Lectin, mannose-binding, 1 like (LMAN1L, Accession NP_078971.2) is another GAM144 target gene, herein designated TARGET GENE. LMAN1L BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LMAN1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LMAN1L BINDING SITE, designated SEQ ID:13160, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23884] Another function of GAM144 is therefore inhibition of Lectin, mannose-binding, 1 like (LMAN1L, Accession NP_078971.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMAN1L.

[23885] LOC125058 (Accession XP_008617.5) is another GAM144 target gene, herein designated TARGET GENE. LOC125058 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC125058, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC125058 BINDING SITE, designated SEQ ID:17192, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23886] Another function of GAM144 is therefore inhibition of LOC125058 (Accession XP_008617.5) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125058.

[23887] LOC126661 (Accession XP_059061.2) is another GAM144 target gene, herein designated TARGET GENE. LOC126661 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC126661, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:12608, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23888] Another function of GAM144 is therefore inhibition of LOC126661 (Accession XP_059061.2) . Accordingly, utili-

ties of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661.

[23889] LOC130672 (Accession XP_059465.1) is another GAM144 target gene, herein designated TARGET GENE. LOC130672 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130672, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130672 BINDING SITE, designated SEQ ID:18606, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23890] Another function of GAM144 is therefore inhibition of LOC130672 (Accession XP_059465.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130672.

[23891] LOC132205 (Accession XP_067736.5) is another GAM144 target gene, herein designated TARGET GENE. LOC132205 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC132205, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132205 BINDING SITE, designated SEQ ID:3634, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23892] Another function of GAM144 is therefore inhibition of LOC132205 (Accession XP_067736.5) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132205.

[23893] LOC133491 (Accession XP_059655.2) is another GAM144 target gene, herein designated TARGET GENE. LOC133491 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC133491, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133491 BINDING SITE, designated SEQ ID:19600, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23894] Another function of GAM144 is therefore inhibition of LOC133491 (Accession XP_059655.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC133491.

[23895] LOC139547 (Accession XP_066756.4) is another GAM144 target gene, herein designated TARGET GENE. LOC139547 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC139547, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC139547 BINDING SITE, designated SEQ ID:7462, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23896] Another function of GAM144 is therefore inhibition of LOC139547 (Accession XP_066756.4) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139547.

[23897] LOC143425 (Accession NP_783860.1) is another GAM144 target gene, herein designated TARGET GENE. LOC143425 BINDING SITE1 and LOC143425 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC143425, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE1 and LOC143425 BINDING SITE2, designated SEQ ID:15557 and SEQ ID:15233 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23898] Another function of GAM144 is therefore inhibition of LOC143425 (Accession NP_783860.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425.

[23899] LOC144266 (Accession XP_084795.1) is another GAM144 target gene, herein designated TARGET GENE. LOC144266 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144266 BINDING SITE, designated SEQ ID:6620, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23900] Another function of GAM144 is therefore inhibition of LOC144266 (Accession XP_084795.1) . Accordingly, utili-

ties of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144266.

[23901] LOC144742 (Accession XP_084949.1) is another GAM144 target gene, herein designated TARGET GENE. LOC144742 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144742, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144742 BINDING SITE, designated SEQ ID:3867, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23902] Another function of GAM144 is therefore inhibition of LOC144742 (Accession XP_084949.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144742.

[23903] LOC145601 (Accession XP_096816.1) is another GAM144 target gene, herein designated TARGET GENE. LOC145601 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145601, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145601 BINDING SITE, designated SEQ ID:5208, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23904] Another function of GAM144 is therefore inhibition of LOC145601 (Accession XP_096816.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145601.

[23905] LOC146177 (Accession NP_778229.1) is another GAM144 target gene, herein designated TARGET GENE. LOC146177 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146177 BINDING SITE, designated SEQ ID:8484, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23906] Another function of GAM144 is therefore inhibition of LOC146177 (Accession NP_778229.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146177.

[23907] LOC148640 (Accession XP_086257.1) is another GAM144 target gene, herein designated TARGET GENE. LOC148640 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148640, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148640 BINDING SITE, designated SEQ ID:12242, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23908] Another function of GAM144 is therefore inhibition of LOC148640 (Accession XP_086257.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148640.

[23909] LOC149018 (Accession XP_086402.1) is another GAM144 target gene, herein designated TARGET GENE. LOC149018 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149018, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC149018 BINDING SITE, designated SEQ ID:1158, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23910] Another function of GAM144 is therefore inhibition of LOC149018 (Accession XP_086402.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149018.

[23911] LOC152225 (Accession XP_098181.1) is another GAM144 target gene, herein designated TARGET GENE. LOC152225 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152225, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152225 BINDING SITE, designated SEQ ID:20184, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23912] Another function of GAM144 is therefore inhibition of LOC152225 (Accession XP_098181.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152225.

[23913] LOC153516 (Accession NP_612500.1) is another GAM144 target gene, herein designated TARGET GENE. LOC153516 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153516, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153516 BINDING SITE, designated SEQ ID:11300, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23914] Another function of GAM144 is therefore inhibition of LOC153516 (Accession NP_612500.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153516.

[23915] LOC154877 (Accession XP_098626.1) is another GAM144 target gene, herein designated TARGET GENE. LOC154877 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC154877 BINDING SITE, designated SEQ ID:771, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23916] Another function of GAM144 is therefore inhibition of LOC154877 (Accession XP_098626.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877.

[23917] LOC155032 (Accession XP_098647.1) is another GAM144 target gene, herein designated TARGET GENE. LOC155032 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC155032, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155032 BINDING SITE, designated SEQ ID:14193, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23918] Another function of GAM144 is therefore inhibition of LOC155032 (Accession XP_098647.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155032.

[23919] LOC164118 (Accession XP_089384.5) is another GAM144 target gene, herein designated TARGET GENE. LOC164118 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC164118, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC164118 BINDING SITE, designated SEQ ID:9005, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23920] Another function of GAM144 is therefore inhibition of LOC164118 (Accession XP_089384.5) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164118.

[23921] LOC169981 (Accession XP_093024.3) is another GAM144 target gene, herein designated TARGET GENE. LOC169981 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC169981, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC169981 BINDING SITE, designated SEQ ID:18817, to

the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23922] Another function of GAM144 is therefore inhibition of LOC169981 (Accession XP_093024.3) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169981.

[23923] LOC197342 (Accession XP_113869.1) is another GAM144 target gene, herein designated TARGET GENE. LOC197342 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197342, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:6172, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23924] Another function of GAM144 is therefore inhibition of LOC197342 (Accession XP_113869.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342.

[23925] LOC221749 (Accession XP_166341.3) is another GAM144

target gene, herein designated TARGET GENE. LOC221749 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221749, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221749 BINDING SITE, designated SEQ ID:3541, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23926] Another function of GAM144 is therefore inhibition of LOC221749 (Accession XP_166341.3) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221749.

[23927] LOC221938 (Accession XP_166542.2) is another GAM144 target gene, herein designated TARGET GENE. LOC221938 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221938, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221938 BINDING SITE, designated SEQ ID:5317, to the nucleotide sequence of GAM144 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:361.

[23928] Another function of GAM144 is therefore inhibition of LOC221938 (Accession XP_166542.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221938.

[23929] LOC255330 (Accession NP_777595.1) is another GAM144 target gene, herein designated TARGET GENE. LOC255330 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255330, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255330 BINDING SITE, designated SEQ ID:1604, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23930] Another function of GAM144 is therefore inhibition of LOC255330 (Accession NP_777595.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255330.

[23931] LOC255926 (Accession XP_171190.3) is another GAM144 target gene, herein designated TARGET GENE. LOC255926

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255926, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255926 BINDING SITE, designated SEQ ID:448, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23932] Another function of GAM144 is therefore inhibition of LOC255926 (Accession XP_171190.3) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255926.

[23933] LOC255975 (Accession XP_171083.2) is another GAM144 target gene, herein designated TARGET GENE. LOC255975 BINDING SITE1 and LOC255975 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC255975, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE1 and LOC255975 BINDING SITE2, designated SEQ ID:7649 and SEQ ID:10185 respectively, to the nucleotide se-

quence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23934] Another function of GAM144 is therefore inhibition of LOC255975 (Accession XP_171083.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975.

[23935] LOC255992 (Accession XP_172605.1) is another GAM144 target gene, herein designated TARGET GENE. LOC255992 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255992, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255992 BINDING SITE, designated SEQ ID:11034, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23936] Another function of GAM144 is therefore inhibition of LOC255992 (Accession XP_172605.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255992.

[23937] LOC283045 (Accession XP_210866.1) is another GAM144

target gene, herein designated TARGET GENE. LOC283045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283045 BINDING SITE, designated SEQ ID:15659, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23938] Another function of GAM144 is therefore inhibition of LOC283045 (Accession XP_210866.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283045.

[23939] LOC283048 (Accession XP_210867.1) is another GAM144 target gene, herein designated TARGET GENE. LOC283048 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283048, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283048 BINDING SITE, designated SEQ ID:3775, to the nucleotide sequence of GAM144 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:361.

[23940] Another function of GAM144 is therefore inhibition of LOC283048 (Accession XP_210867.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283048.

[23941] LOC283125 (Accession XP_210897.1) is another GAM144 target gene, herein designated TARGET GENE. LOC283125 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283125 BINDING SITE, designated SEQ ID:16750, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23942] Another function of GAM144 is therefore inhibition of LOC283125 (Accession XP_210897.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283125.

[23943] LOC283232 (Accession NP_777600.1) is another GAM144 target gene, herein designated TARGET GENE. LOC283232

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283232 BINDING SITE, designated SEQ ID:6314, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23944] Another function of GAM144 is therefore inhibition of LOC283232 (Accession NP_777600.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283232.

[23945] LOC283382 (Accession XP_211005.1) is another GAM144 target gene, herein designated TARGET GENE. LOC283382 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283382, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283382 BINDING SITE, designated SEQ ID:13039, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23946] Another function of GAM144 is therefore inhibition of LOC283382 (Accession XP_211005.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283382.

[23947] LOC283505 (Accession XP_208702.1) is another GAM144 target gene, herein designated TARGET GENE. LOC283505 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283505, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283505 BINDING SITE, designated SEQ ID:5605, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23948] Another function of GAM144 is therefore inhibition of LOC283505 (Accession XP_208702.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283505.

[23949] LOC283806 (Accession XP_208846.1) is another GAM144 target gene, herein designated TARGET GENE. LOC283806 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC283806, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283806 BINDING SITE, designated SEQ ID:707, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23950] Another function of GAM144 is therefore inhibition of LOC283806 (Accession XP_208846.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283806.

[23951] LOC284065 (Accession XP_208995.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284065 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284065, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284065 BINDING SITE, designated SEQ ID:12322, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23952] Another function of GAM144 is therefore inhibition of

LOC284065 (Accession XP_208995.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284065.

[23953] LOC284133 (Accession XP_211346.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284133 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284133 BINDING SITE, designated SEQ ID:12882, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23954] Another function of GAM144 is therefore inhibition of LOC284133 (Accession XP_211346.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284133.

[23955] LOC284175 (Accession XP_211364.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284175 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284175, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284175 BINDING SITE, designated SEQ ID:8090, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23956] Another function of GAM144 is therefore inhibition of LOC284175 (Accession XP_211364.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284175.

[23957] LOC284202 (Accession XP_208174.2) is another GAM144 target gene, herein designated TARGET GENE. LOC284202 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284202, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284202 BINDING SITE, designated SEQ ID:10595, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23958] Another function of GAM144 is therefore inhibition of LOC284202 (Accession XP_208174.2) . Accordingly, utili-

ties of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284202.

[23959] LOC284242 (Accession XP_211398.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284242 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284242, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284242 BINDING SITE, designated SEQ ID:16270, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23960] Another function of GAM144 is therefore inhibition of LOC284242 (Accession XP_211398.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284242.

[23961] LOC284265 (Accession XP_209096.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284265 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284265, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284265 BINDING SITE, designated SEQ ID:12953, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23962] Another function of GAM144 is therefore inhibition of LOC284265 (Accession XP_209096.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284265.

[23963] LOC284600 (Accession XP_211548.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284600 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284600, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284600 BINDING SITE, designated SEQ ID:7901, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23964] Another function of GAM144 is therefore inhibition of LOC284600 (Accession XP_211548.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284600.

[23965] LOC284811 (Accession XP_211643.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284811 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284811, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284811 BINDING SITE, designated SEQ ID:4644, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23966] Another function of GAM144 is therefore inhibition of LOC284811 (Accession XP_211643.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284811.

[23967] LOC284836 (Accession XP_211654.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284836 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284836, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284836 BINDING SITE, designated SEQ ID:6675, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23968] Another function of GAM144 is therefore inhibition of LOC284836 (Accession XP_211654.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284836.

[23969] LOC284952 (Accession XP_211706.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284952 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284952, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284952 BINDING SITE, designated SEQ ID:4865, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23970] Another function of GAM144 is therefore inhibition of LOC284952 (Accession XP_211706.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284952.

[23971] LOC284981 (Accession XP_211720.1) is another GAM144 target gene, herein designated TARGET GENE. LOC284981 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284981, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284981 BINDING SITE, designated SEQ ID:9447, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23972] Another function of GAM144 is therefore inhibition of LOC284981 (Accession XP_211720.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284981.

[23973] LOC285092 (Accession XP_210410.3) is another GAM144 target gene, herein designated TARGET GENE. LOC285092 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285092 BINDING SITE, designated SEQ ID:4645, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23974] Another function of GAM144 is therefore inhibition of LOC285092 (Accession XP_210410.3) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285092.

[23975] LOC285633 (Accession XP_211965.1) is another GAM144 target gene, herein designated TARGET GENE. LOC285633 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285633, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285633 BINDING SITE, designated SEQ ID:7854, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23976] Another function of GAM144 is therefore inhibition of LOC285633 (Accession XP_211965.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285633.

[23977] LOC285673 (Accession XP_209720.1) is another GAM144 target gene, herein designated TARGET GENE. LOC285673 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285673 BINDING SITE, designated SEQ ID:7761, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23978] Another function of GAM144 is therefore inhibition of LOC285673 (Accession XP_209720.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285673.

[23979] LOC285678 (Accession XP_209717.1) is another GAM144 target gene, herein designated TARGET GENE. LOC285678 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285678, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285678 BINDING SITE, designated SEQ ID:7718, to

the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23980] Another function of GAM144 is therefore inhibition of LOC285678 (Accession XP_209717.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285678.

[23981] LOC285812 (Accession XP_212055.1) is another GAM144 target gene, herein designated TARGET GENE. LOC285812 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285812 BINDING SITE, designated SEQ ID:9156, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23982] Another function of GAM144 is therefore inhibition of LOC285812 (Accession XP_212055.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285812.

[23983] LOC285853 (Accession XP_209779.1) is another GAM144

target gene, herein designated TARGET GENE. LOC285853 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285853, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285853 BINDING SITE, designated SEQ ID:14829, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23984] Another function of GAM144 is therefore inhibition of LOC285853 (Accession XP_209779.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285853.

[23985] LOC285950 (Accession XP_212089.1) is another GAM144 target gene, herein designated TARGET GENE. LOC285950 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285950, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285950 BINDING SITE, designated SEQ ID:8104, to the nucleotide sequence of GAM144 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:361.

[23986] Another function of GAM144 is therefore inhibition of LOC285950 (Accession XP_212089.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285950.

[23987] LOC286044 (Accession XP_212150.1) is another GAM144 target gene, herein designated TARGET GENE. LOC286044 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286044, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286044 BINDING SITE, designated SEQ ID:19106, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23988] Another function of GAM144 is therefore inhibition of LOC286044 (Accession XP_212150.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286044.

[23989] LOC286166 (Accession XP_209925.1) is another GAM144 target gene, herein designated TARGET GENE. LOC286166

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286166 BINDING SITE, designated SEQ ID:6568, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23990] Another function of GAM144 is therefore inhibition of LOC286166 (Accession XP_209925.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286166.

[23991] LOC286425 (Accession XP_208420.1) is another GAM144 target gene, herein designated TARGET GENE. LOC286425 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286425, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286425 BINDING SITE, designated SEQ ID:13002, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23992] Another function of GAM144 is therefore inhibition of LOC286425 (Accession XP_208420.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286425.

[23993] LOC286528 (Accession XP_210501.1) is another GAM144 target gene, herein designated TARGET GENE. LOC286528 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286528, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286528 BINDING SITE, designated SEQ ID:9313, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23994] Another function of GAM144 is therefore inhibition of LOC286528 (Accession XP_210501.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286528.

[23995] LOC338585 (Accession XP_294658.1) is another GAM144 target gene, herein designated TARGET GENE. LOC338585 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC338585, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338585 BINDING SITE, designated SEQ ID:513, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23996] Another function of GAM144 is therefore inhibition of LOC338585 (Accession XP_294658.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338585.

[23997] LOC338609 (Accession XP_294664.1) is another GAM144 target gene, herein designated TARGET GENE. LOC338609 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338609, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338609 BINDING SITE, designated SEQ ID:17348, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[23998] Another function of GAM144 is therefore inhibition of

LOC338609 (Accession XP_294664.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338609.

[23999] LOC338842 (Accession XP_294729.1) is another GAM144 target gene, herein designated TARGET GENE. LOC338842 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338842, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338842 BINDING SITE, designated SEQ ID:16575, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24000] Another function of GAM144 is therefore inhibition of LOC338842 (Accession XP_294729.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338842.

[24001] LOC339159 (Accession XP_294834.2) is another GAM144 target gene, herein designated TARGET GENE. LOC339159 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339159, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339159 BINDING SITE, designated SEQ ID:16086, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24002] Another function of GAM144 is therefore inhibition of LOC339159 (Accession XP_294834.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339159.

[24003] LOC339354 (Accession XP_290289.1) is another GAM144 target gene, herein designated TARGET GENE. LOC339354 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339354, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339354 BINDING SITE, designated SEQ ID:17438, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24004] Another function of GAM144 is therefore inhibition of LOC339354 (Accession XP_290289.1) . Accordingly, utili-

ties of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339354.

[24005] LOC339381 (Accession XP_086070.2) is another GAM144 target gene, herein designated TARGET GENE. LOC339381 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339381, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339381 BINDING SITE, designated SEQ ID:17886, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24006] Another function of GAM144 is therefore inhibition of LOC339381 (Accession XP_086070.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339381.

[24007] LOC339385 (Accession XP_290863.1) is another GAM144 target gene, herein designated TARGET GENE. LOC339385 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339385, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339385 BINDING SITE, designated SEQ ID:11261, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24008] Another function of GAM144 is therefore inhibition of LOC339385 (Accession XP_290863.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339385.

[24009] LOC339711 (Accession XP_295038.1) is another GAM144 target gene, herein designated TARGET GENE. LOC339711 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339711, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339711 BINDING SITE, designated SEQ ID:12948, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24010] Another function of GAM144 is therefore inhibition of LOC339711 (Accession XP_295038.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC339711.

[24011] LOC339717 (Accession XP_295040.1) is another GAM144 target gene, herein designated TARGET GENE. LOC339717 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339717, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339717 BINDING SITE, designated SEQ ID:18301, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24012] Another function of GAM144 is therefore inhibition of LOC339717 (Accession XP_295040.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339717.

[24013] LOC340449 (Accession XP_290424.2) is another GAM144 target gene, herein designated TARGET GENE. LOC340449 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340449, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC340449 BINDING SITE, designated SEQ ID:13612, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24014] Another function of GAM144 is therefore inhibition of LOC340449 (Accession XP_290424.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340449.

[24015] LOC340895 (Accession XP_295865.1) is another GAM144 target gene, herein designated TARGET GENE. LOC340895 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340895, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340895 BINDING SITE, designated SEQ ID:1020, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24016] Another function of GAM144 is therefore inhibition of LOC340895 (Accession XP_295865.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC340895.

[24017] LOC347546 (Accession XP_298101.2) is another GAM144 target gene, herein designated TARGET GENE. LOC347546 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347546, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347546 BINDING SITE, designated SEQ ID:1558, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24018] Another function of GAM144 is therefore inhibition of LOC347546 (Accession XP_298101.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347546.

[24019] LOC348099 (Accession XP_302654.1) is another GAM144 target gene, herein designated TARGET GENE. LOC348099 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348099, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348099 BINDING SITE, designated SEQ ID:1075, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24020] Another function of GAM144 is therefore inhibition of LOC348099 (Accession XP_302654.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348099.

[24021] LOC348144 (Accession XP_300638.1) is another GAM144 target gene, herein designated TARGET GENE. LOC348144 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348144, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348144 BINDING SITE, designated SEQ ID:9665, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24022] Another function of GAM144 is therefore inhibition of LOC348144 (Accession XP_300638.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348144.

[24023] LOC348406 (Accession XP_302746.1) is another GAM144 target gene, herein designated TARGET GENE. LOC348406 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348406, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348406 BINDING SITE, designated SEQ ID:5817, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24024] Another function of GAM144 is therefore inhibition of LOC348406 (Accession XP_302746.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348406.

[24025] LOC348461 (Accession XP_302764.1) is another GAM144 target gene, herein designated TARGET GENE. LOC348461 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348461 BINDING SITE, designated SEQ ID:4302, to

the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24026] Another function of GAM144 is therefore inhibition of LOC348461 (Accession XP_302764.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348461.

[24027] LOC348527 (Accession XP_300779.1) is another GAM144 target gene, herein designated TARGET GENE. LOC348527 BINDING SITE1 and LOC348527 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348527, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348527 BINDING SITE1 and LOC348527 BINDING SITE2, designated SEQ ID:14241 and SEQ ID:8859 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24028] Another function of GAM144 is therefore inhibition of LOC348527 (Accession XP_300779.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348527.

[24029] LOC348768 (Accession XP_302883.1) is another GAM144 target gene, herein designated TARGET GENE. LOC348768 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348768 BINDING SITE, designated SEQ ID:10838, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24030] Another function of GAM144 is therefore inhibition of LOC348768 (Accession XP_302883.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348768.

[24031] LOC348842 (Accession XP_300861.1) is another GAM144 target gene, herein designated TARGET GENE. LOC348842 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348842, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348842 BINDING SITE, designated SEQ ID:7649, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24032] Another function of GAM144 is therefore inhibition of LOC348842 (Accession XP_300861.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348842.

[24033] LOC349234 (Accession XP_300987.1) is another GAM144 target gene, herein designated TARGET GENE. LOC349234 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349234, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349234 BINDING SITE, designated SEQ ID:10784, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24034] Another function of GAM144 is therefore inhibition of LOC349234 (Accession XP_300987.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349234.

[24035] LOC349323 (Accession XP_301029.1) is another GAM144 target gene, herein designated TARGET GENE. LOC349323 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349323 BINDING SITE, designated SEQ ID:6731, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24036] Another function of GAM144 is therefore inhibition of LOC349323 (Accession XP_301029.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349323.

[24037] LOC351983 (Accession XP_305307.1) is another GAM144 target gene, herein designated TARGET GENE. LOC351983 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351983, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC351983 BINDING SITE, designated SEQ ID:9902, to

the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24038] Another function of GAM144 is therefore inhibition of LOC351983 (Accession XP_305307.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC351983.

[24039] LOC90529 (Accession NP_835223.1) is another GAM144 target gene, herein designated TARGET GENE. LOC90529 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90529 BINDING SITE, designated SEQ ID:10023, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24040] Another function of GAM144 is therefore inhibition of LOC90529 (Accession NP_835223.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90529.

[24041] LOC91661 (Accession NP_612381.1) is another GAM144

target gene, herein designated TARGET GENE. LOC91661 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91661, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:17439, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24042] Another function of GAM144 is therefore inhibition of LOC91661 (Accession NP_612381.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661.

[24043] LOC91664 (Accession XP_039908.2) is another GAM144 target gene, herein designated TARGET GENE. LOC91664 BINDING SITE1 and LOC91664 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC91664, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91664 BINDING SITE1 and LOC91664 BINDING SITE2, designated SEQ ID:16097

and SEQ ID:20155 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24044] Another function of GAM144 is therefore inhibition of LOC91664 (Accession XP_039908.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91664.

[24045] LOC93097 (Accession XP_049221.1) is another GAM144 target gene, herein designated TARGET GENE. LOC93097 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC93097, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93097 BINDING SITE, designated SEQ ID:7213, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24046] Another function of GAM144 is therefore inhibition of LOC93097 (Accession XP_049221.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93097.

[24047] LOC96597 (Accession XP_039922.1) is another GAM144 target gene, herein designated TARGET GENE. LOC96597 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC96597, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:16552, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24048] Another function of GAM144 is therefore inhibition of LOC96597 (Accession XP_039922.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597.

[24049] Lysyl oxidase-like 1 (LOXL1, Accession NP_005567.1) is another GAM144 target gene, herein designated TARGET GENE. LOXL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOXL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOXL1 BINDING SITE, designated SEQ

ID:14029, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24050] Another function of GAM144 is therefore inhibition of Lysyl oxidase-like 1 (LOXL1, Accession NP_005567.1), a gene which is Involved in collagen and elastin crosslinking. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL1.

[24051] The function of LOXL1 has been established by previous studies. Kenyon et al. (1993) isolated a novel human cDNA with a predicted protein homologous to the carboxyl end of lysyl oxidase (LOX; 153455). The homology to lysyl oxidase began exactly at the position of the exon 1/exon 2 boundary in the mouse gene. The lysyl oxidase- like gene, which appeared to be no larger than 22.1 kb, coded for a single polyadenylated RNA species of 2.48 kb By fluorescence in situ hybridization, Kenyon et al. (1993) mapped the human LOXL gene to 15q24- q25. Using interspecific backcross analysis, Wydner et al. (1997) mapped the mouse Loxl gene to chromosome 9, in a region that shows conservation of synteny with human 15q24. Goy et al. (2000) presented physical mapping data demonstrating linkage of the LOXL1 gene to the PML gene (OMIM Ref. No.

102578) on human chromosome 15q22.

[24052]

[24053] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24054] Kenyon, K.; Modi, W. S.; Contente, S.; Friedman, R. M. : A novel human cDNA with a predicted protein similar to lysyl oxidase maps to chromosome 15q24- q25. J. Biol. Chem. 268: 18435- 18437, 1993. ; and

[24055] Kim, Y.; Boyd, C. D.; Csiszar, K. : A new gene with sequence and structural similarity to the gene encoding human lysyl oxidase. J. Biol. Chem. 270: 7176- 7182, 1995.

[24056] Further studies establishing the function and utilities of LOXL1 are found in John Hopkins OMIM database record ID 153456, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mucosal vascular addressin cell adhesion molecule 1 (MADCAM1, Accession NP_570117.1) is another GAM144 target gene, herein designated TARGET GENE. MADCAM1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MADCAM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MADCAM1 BINDING SITE, designated SEQ ID:13746, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24057] Another function of GAM144 is therefore inhibition of Mucosal vascular addressin cell adhesion molecule 1 (MADCAM1, Accession NP_570117.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADCAM1.

[24058] Mucosal vascular addressin cell adhesion molecule 1 (MADCAM1, Accession NP_570116.1) is another GAM144 target gene, herein designated TARGET GENE. MADCAM1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MADCAM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MADCAM1 BINDING SITE, designated SEQ ID:13746, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24059] Another function of GAM144 is therefore inhibition of Mucosal vascular addressin cell adhesion molecule 1 (MADCAM1, Accession NP_570116.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADCAM1.

[24060] Mucosal vascular addressin cell adhesion molecule 1 (MADCAM1, Accession NP_570118.1) is another GAM144 target gene, herein designated TARGET GENE. MADCAM1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MADCAM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MADCAM1 BINDING SITE, designated SEQ ID:13746, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24061] Another function of GAM144 is therefore inhibition of Mucosal vascular addressin cell adhesion molecule 1 (MADCAM1, Accession NP_570118.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MADCAM1.

[24062] MGC10702 (Accession NP_116052.1) is another GAM144 target gene, herein designated TARGET GENE. MGC10702 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC10702, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10702 BINDING SITE, designated SEQ ID:17096, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24063] Another function of GAM144 is therefore inhibition of MGC10702 (Accession NP_116052.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10702.

[24064] MGC16638 (Accession NP_777593.1) is another GAM144 target gene, herein designated TARGET GENE. MGC16638 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC16638, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC16638 BINDING SITE, designated SEQ ID:14522, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24065] Another function of GAM144 is therefore inhibition of MGC16638 (Accession NP_777593.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16638.

[24066] MGC17791 (Accession NP_689575.1) is another GAM144 target gene, herein designated TARGET GENE. MGC17791 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC17791, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC17791 BINDING SITE, designated SEQ ID:1463, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24067] Another function of GAM144 is therefore inhibition of MGC17791 (Accession NP_689575.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17791.

[24068] MGC23270 (Accession NP_689859.1) is another GAM144 target gene, herein designated TARGET GENE. MGC23270 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC23270, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC23270 BINDING SITE, designated SEQ ID:9116, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24069] Another function of GAM144 is therefore inhibition of MGC23270 (Accession NP_689859.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23270.

[24070] MGC29761 (Accession NP_653255.1) is another GAM144 target gene, herein designated TARGET GENE. MGC29761 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC29761, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC29761 BINDING SITE, designated SEQ ID:8792, to the

nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24071] Another function of GAM144 is therefore inhibition of MGC29761 (Accession NP_653255.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29761.

[24072] MGC3169 (Accession NP_076979.1) is another GAM144 target gene, herein designated TARGET GENE. MGC3169 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3169 BINDING SITE, designated SEQ ID:19412, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24073] Another function of GAM144 is therefore inhibition of MGC3169 (Accession NP_076979.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3169.

[24074] MGC35366 (Accession NP_689648.1) is another GAM144

target gene, herein designated TARGET GENE. MGC35366 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC35366, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35366 BINDING SITE, designated SEQ ID:13055, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24075] Another function of GAM144 is therefore inhibition of MGC35366 (Accession NP_689648.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35366.

[24076] MGC4368 (Accession NP_078786.2) is another GAM144 target gene, herein designated TARGET GENE. MGC4368 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4368, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4368 BINDING SITE, designated SEQ ID:10795, to the nucleotide sequence of GAM144 RNA, herein designated

GAM RNA, also designated SEQ ID:361.

[24077] Another function of GAM144 is therefore inhibition of MGC4368 (Accession NP_078786.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4368.

[24078] MGC45380 (Accession NP_597723.1) is another GAM144 target gene, herein designated TARGET GENE. MGC45380 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC45380, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC45380 BINDING SITE, designated SEQ ID:1218, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24079] Another function of GAM144 is therefore inhibition of MGC45380 (Accession NP_597723.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC45380.

[24080] MIRAB13 (Accession NP_203744.1) is another GAM144 target gene, herein designated TARGET GENE. MIRAB13

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MIRAB13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIRAB13 BINDING SITE, designated SEQ ID:10121, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24081] Another function of GAM144 is therefore inhibition of MIRAB13 (Accession NP_203744.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIRAB13.

[24082] MIRAB13 (Accession XP_039236.6) is another GAM144 target gene, herein designated TARGET GENE. MIRAB13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MIRAB13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIRAB13 BINDING SITE, designated SEQ ID:10121, to the nucleotide sequence of GAM144

RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24083] Another function of GAM144 is therefore inhibition of MIRAB13 (Accession XP_039236.6) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIRAB13.

[24084] Makorin, ring finger protein, 1 (MKRN1, Accession NP_038474.1) is another GAM144 target gene, herein designated TARGET GENE. MKRN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MKRN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MKRN1 BINDING SITE, designated SEQ ID:5351, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24085] Another function of GAM144 is therefore inhibition of Makorin, ring finger protein, 1 (MKRN1, Accession NP_038474.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN1.

[24086] Membrane protein, palmitoylated 2 (maguk p55 subfamily

member 2) (MPP2, Accession NP_005365.2) is another GAM144 target gene, herein designated TARGET GENE. MPP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:15648, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24087] Another function of GAM144 is therefore inhibition of Membrane protein, palmitoylated 2 (maguk p55 subfamily member 2) (MPP2, Accession NP_005365.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2.

[24088] Mucin 6, gastric (MUC6, Accession XP_290540.1) is another GAM144 target gene, herein designated TARGET GENE. MUC6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MUC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of MUC6 BINDING SITE, designated SEQ ID:19534, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24089] Another function of GAM144 is therefore inhibition of Mucin 6, gastric (MUC6, Accession XP_290540.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC6.

[24090] Neuron navigator 1 (NAV1, Accession NP_065176.2) is another GAM144 target gene, herein designated TARGET GENE. NAV1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NAV1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAV1 BINDING SITE, designated SEQ ID:1396, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24091] Another function of GAM144 is therefore inhibition of Neuron navigator 1 (NAV1, Accession NP_065176.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV1.

[24092] Ndrg family member 4 (NDRG4, Accession NP_075061.1) is another GAM144 target gene, herein designated TARGET GENE. NDRG4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NDRG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE, designated SEQ ID:19945, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24093] Another function of GAM144 is therefore inhibition of Ndrg family member 4 (NDRG4, Accession NP_075061.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4.

[24094] Ndrg family member 4 (NDRG4, Accession NP_065198.1) is another GAM144 target gene, herein designated TARGET GENE. NDRG4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NDRG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of NDRG4 BINDING SITE, designated SEQ ID:19945, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24095] Another function of GAM144 is therefore inhibition of Ndrg family member 4 (NDRG4, Accession NP_065198.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4.

[24096] Sialidase 3 (membrane sialidase) (NEU3, Accession NP_006647.2) is another GAM144 target gene, herein designated TARGET GENE. NEU3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEU3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:4466, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24097] Another function of GAM144 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NP_006647.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with NEU3.

[24098] Nuclear factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NP_003195.1) is another GAM144 target gene, herein designated TARGET GENE. NFE2L1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NFE2L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFE2L1 BINDING SITE, designated SEQ ID:1538, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24099] Another function of GAM144 is therefore inhibition of Nuclear factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NP_003195.1), a gene which may regulate expression of ferritin genes. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2L1.

[24100] The function of NFE2L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM90.1.Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) is another GAM144 target gene,

herein designated TARGET GENE. NIPSNAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NIPSNAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NIPSNAP1 BINDING SITE, designated SEQ ID:8413, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24101] Another function of GAM144 is therefore inhibition of Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIPSNAP1.

[24102] Nuclear receptor subfamily 2, group e, member 3 (NR2E3, Accession NP_057430.1) is another GAM144 target gene, herein designated TARGET GENE. NR2E3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NR2E3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR2E3 BINDING SITE, designated SEQ ID:3895, to the nu-

cleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24103] Another function of GAM144 is therefore inhibition of Nuclear receptor subfamily 2, group e, member 3 (NR2E3, Accession NP_057430.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2E3.

[24104] Neurotensin receptor 1 (high affinity) (NTSR1, Accession NP_002522.1) is another GAM144 target gene, herein designated TARGET GENE. NTSR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NTSR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:19566, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24105] Another function of GAM144 is therefore inhibition of Neurotensin receptor 1 (high affinity) (NTSR1, Accession NP_002522.1), a gene which is associated with g proteins that activate a phosphatidylinositol- calcium second messenger system. Accordingly, utilities of GAM144 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1.

[24106] The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM133.1.Nudix (nucleoside diphosphate linked moiety x)-type motif 11 (NUDT11, Accession NP_060629.1) is another GAM144 target gene, herein designated TARGET GENE. NUDT11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUDT11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:3712, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24107] Another function of GAM144 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety x)-type motif 11 (NUDT11, Accession NP_060629.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11.

[24108] Olfactory receptor, family 2, subfamily h, member 1

(OR2H1, Accession NP_112145.1) is another GAM144 target gene, herein designated TARGET GENE. OR2H1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by OR2H1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OR2H1 BINDING SITE, designated SEQ ID:7630, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24109] Another function of GAM144 is therefore inhibition of Olfactory receptor, family 2, subfamily h, member 1 (OR2H1, Accession NP_112145.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR2H1.

[24110] Oxytocin receptor (OXTR, Accession NP_000907.1) is another GAM144 target gene, herein designated TARGET GENE. OXTR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by OXTR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OXTR BINDING SITE, designated SEQ ID:15896,

to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24111] Another function of GAM144 is therefore inhibition of Oxytocin receptor (OXTR, Accession NP_000907.1), a gene which induces inward ion currents. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXTR.

[24112] The function of OXTR has been established by previous studies. Just before the onset of labor, uterine muscle becomes exceedingly sensitive to oxytocin, for which it is a primary target tissue, because of a dramatic increase in the number of oxytocin receptors. Kimura et al. (1992) reported the structure and expression of the human oxytocin receptor cDNA isolated by expression cloning. The encoded receptor was a 388- amino acid polypeptide with 7 transmembrane domains typical of G protein- coupled receptors. The oxytocin receptor, expressed in Xenopus oocytes, specifically responded to oxytocin and induced an inward membrane current. Messenger RNAs for the receptor were of 2 sizes, 3.6 kb in breast and 4.4 kb in ovary, endometrium, and myometrium. The mRNA level in myometrium was very high at term. Yang et al. (2002) found that mutation of lysine- 270 (K270) in wildtype OTR

completely abolished the ability of the receptor to stimulate phosphatidylinositide turnover, with only a small reduction in ligand affinity. These data demonstrated that OTR K270 is critically important in the stimulation by OTR of phosphatidylinositide turnover. Mutation of K270 also adversely affected the ability of OTR to stimulate ERK1/2 (601795, 176948) phosphorylation. Therefore, this residue plays an important role in the specificity of OTR/G- alpha- q (OMIM Ref. No. 600998)/PLC (see OMIM Ref. No. 602142) coupling.

[24113]

[24114] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24115] Kimura, T.; Tanizawa, O.; Mori, K.; Brownstein, M. J.; Okayama, H. : Structure and expression of a human oxytocin receptor. Nature 356: 526- 529, 1992. ; and

[24116] Yang, M.; Wang, W.; Zhong, M.; Philippi, A.; Lichtarge, O.; Sanborn, B. M. : Lysine 270 in the third intracellular domain of the oxytocin receptor is an important determinant for G- alph.

[24117] Further studies establishing the function and utilities of OXTR are found in John Hopkins OMIM database record ID

167055, and in cited publications listed in Table 5, which are hereby incorporated by reference.PACAP (Accession NP_057543.1) is another GAM144 target gene, herein designated TARGET GENE. PACAP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PACAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PACAP BINDING SITE, designated SEQ ID:6514, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24118] Another function of GAM144 is therefore inhibition of PACAP (Accession NP_057543.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACAP.

[24119] Phosphatidylcholine transfer protein (PCTP, Accession NP_067036.1) is another GAM144 target gene, herein designated TARGET GENE. PCTP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCTP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCTP BINDING SITE, designated

SEQ ID:5135, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24120] Another function of GAM144 is therefore inhibition of Phosphatidylcholine transfer protein (PCTP, Accession NP_067036.1), a gene which catalyzes the transfer of phosphatidylcholine between membranes (by similarity). Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTP.

[24121] The function of PCTP has been established by previous studies. Phosphatidylcholine (PC) transfer protein (PCTP) is a cytosolic protein first purified from bovine and rat liver that catalyzes intermembrane transfer of PC. By searching an EST database for homologs of bovine Pctp, followed by 5- prime RACE and PCR of a kidney cDNA library, Cohen et al. (1999) obtained a cDNA encoding human PCTP. The deduced 214- amino acid human protein is 76% and 80% identical to bovine and rat Pctp, respectively. Northern blot analysis revealed wide expression of an approximately 2.3- kb PCTP transcript in all tissues tested except thymus. Highest expression was detected in liver, placenta, testis, kidney, and heart, and lowest levels were found in brain and lung.

[24122] Animal model experiments lend further support to the function of PCTP. Van Helvoort et al. (1999) disrupted the Pctp gene in mice. Pctp knockout mice showed no defects in the secretion of PC into bile or lung surfactant, and the lipid content and composition of bile and surfactant was normal. The authors concluded that PCTP does not play a major role in transporting PC from the endoplasmic reticulum, where it is synthesized, to the hepatocyte canalicular membrane.

[24123] It is appreciated that the abovementioned animal model for PCTP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24124] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24125] Cohen, D. E.; Green, R. M.; Wu, M. K.; Beier, D. R. : Cloning, tissue- specific expression, gene structure and chromosomal localization of human phosphatidylcholine transfer protein. Biochim. Biophys. Acta 1447: 265- 270, 1999. ; and

[24126] van Helvoort, A.; de Brouwer, A.; Ottenhoff, R.; Brouwers, J. F. H. M.; Wijnholds, J.; Beijnen, J. H.; Rijneveld, A.; van

der Valk, M. A.; Majoor, D.; Voorhout, W.; Wirtz, K. W. A.; El.

[24127] Further studies establishing the function and utilities of PCTP are found in John Hopkins OMIM database record ID 606055, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pdz and lim domain 2 (mystique) (PDLIM2, Accession NP_789847.1) is another GAM144 target gene, herein designated TARGET GENE. PDLIM2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PDLIM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDLIM2 BINDING SITE, designated SEQ ID:3034, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24128] Another function of GAM144 is therefore inhibition of Pdz and lim domain 2 (mystique) (PDLIM2, Accession NP_789847.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDLIM2.

[24129] PIF1 (Accession XP_290643.1) is another GAM144 target

gene, herein designated TARGET GENE. PIF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIF1 BINDING SITE, designated SEQ ID:19368, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24130] Another function of GAM144 is therefore inhibition of PIF1 (Accession XP_290643.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIF1.

[24131] Polycystic kidney disease 2-like 1 (PKD2L1, Accession NP_057196.1) is another GAM144 target gene, herein designated TARGET GENE. PKD2L1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PKD2L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKD2L1 BINDING SITE, designated SEQ ID:7698, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:361.

[24132] Another function of GAM144 is therefore inhibition of Polycystic kidney disease 2-like 1 (PKD2L1, Accession NP_057196.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2L1.

[24133] Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, ehlers-danlos syndrome type vi) (PLOD, Accession NP_000293.1) is another GAM144 target gene, herein designated TARGET GENE. PLOD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLOD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLOD BINDING SITE, designated SEQ ID:2035, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24134] Another function of GAM144 is therefore inhibition of Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, ehlers-danlos syndrome type vi) (PLOD, Accession NP_000293.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with PLOD.

[24135] Polymerase (dna directed), eta (POLH, Accession NP_006493.1) is another GAM144 target gene, herein designated TARGET GENE. POLH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POLH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLH BINDING SITE, designated SEQ ID:6619, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24136] Another function of GAM144 is therefore inhibition of Polymerase (dna directed), eta (POLH, Accession NP_006493.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLH.

[24137] POMT2 (Accession NP_037514.1) is another GAM144 target gene, herein designated TARGET GENE. POMT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POMT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POMT2

BINDING SITE, designated SEQ ID:15796, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24138] Another function of GAM144 is therefore inhibition of POMT2 (Accession NP_037514.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT2.

[24139] Pou domain, class 2, associating factor 1 (POU2AF1, Accession NP_006226.1) is another GAM144 target gene, herein designated TARGET GENE. POU2AF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by POU2AF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:892, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24140] Another function of GAM144 is therefore inhibition of Pou domain, class 2, associating factor 1 (POU2AF1, Accession NP_006226.1), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2 and therefore may be associated with A form of b- cell

leukemia. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of A form of b- cell leukemia, and of other diseases and clinical conditions associated with POU2AF1.

[24141] The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Peptidylprolyl isomerase b (cyclophilin b) (PPIB, Accession NP_000933.1) is another GAM144 target gene, herein designated TARGET GENE. PPIB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPIB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPIB BINDING SITE, designated SEQ ID:8556, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24142] Another function of GAM144 is therefore inhibition of Peptidylprolyl isomerase b (cyclophilin b) (PPIB, Accession NP_000933.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIB.

[24143] Peptidylprolyl isomerase e (cyclophilin e) (PPIE, Accession NP_006103.1) is another GAM144 target gene, herein designated TARGET GENE. PPIE BINDING SITE1 and PPIE BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PPIE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPIE BINDING SITE1 and PPIE BINDING SITE2, designated SEQ ID:11142 and SEQ ID:18340 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24144] Another function of GAM144 is therefore inhibition of Peptidylprolyl isomerase e (cyclophilin e) (PPIE, Accession NP_006103.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIE.

[24145] Protein phosphatase 1, regulatory (inhibitor) subunit 16b (PPP1R16B, Accession NP_056383.1) is another GAM144 target gene, herein designated TARGET GENE. PPP1R16B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:14705, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24146] Another function of GAM144 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 16b (PPP1R16B, Accession NP_056383.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B.

[24147] Protein phosphatase 1, regulatory (inhibitor) subunit 3c (PPP1R3C, Accession NP_005389.1) is another GAM144 target gene, herein designated TARGET GENE. PPP1R3C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R3C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R3C BINDING SITE, designated SEQ ID:19147, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24148] Another function of GAM144 is therefore inhibition of

Protein phosphatase 1, regulatory (inhibitor) subunit 3c (PPP1R3C, Accession NP_005389.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3C.

[24149] Rab11-FIP3 (Accession NP_055515.1) is another GAM144 target gene, herein designated TARGET GENE. Rab11-FIP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by Rab11-FIP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Rab11-FIP3 BINDING SITE, designated SEQ ID:14310, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24150] Another function of GAM144 is therefore inhibition of Rab11-FIP3 (Accession NP_055515.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP3.

[24151] Retinoic acid induced 17 (RAI17, Accession NP_065071.1) is another GAM144 target gene, herein designated TARGET GENE. RAI17 BINDING SITE is a target binding site

found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAI17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:513, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24152] Another function of GAM144 is therefore inhibition of Retinoic acid induced 17 (RAI17, Accession NP_065071.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17.

[24153] Ras guanyl releasing protein 4 (RASGRP4, Accession NP_443181.2) is another GAM144 target gene, herein designated TARGET GENE. RASGRP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASGRP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:10432, to the nucleotide sequence of GAM144 RNA, herein designated

GAM RNA, also designated SEQ ID:361.

[24154] Another function of GAM144 is therefore inhibition of Ras guanyl releasing protein 4 (RASGRP4, Accession NP_443181.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4.

[24155] Recq protein-like 5 (RECQL5, Accession NP_004250.1) is another GAM144 target gene, herein designated TARGET GENE. RECQL5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RECQL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RECQL5 BINDING SITE, designated SEQ ID:15459, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24156] Another function of GAM144 is therefore inhibition of Recq protein-like 5 (RECQL5, Accession NP_004250.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5.

[24157] Regulator of g-protein signalling 6 (RGS6, Accession

NP_004287.3) is another GAM144 target gene, herein designated TARGET GENE. RGS6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGS6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGS6 BINDING SITE, designated SEQ ID:5092, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24158] Another function of GAM144 is therefore inhibition of Regulator of g-protein signalling 6 (RGS6, Accession NP_004287.3) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS6.

[24159] RNF144 (Accession NP_055561.1) is another GAM144 target gene, herein designated TARGET GENE. RNF144 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF144, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF144 BINDING SITE, designated SEQ ID:7933, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA,

also designated SEQ ID:361.

[24160] Another function of GAM144 is therefore inhibition of RNF144 (Accession NP_055561.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF144.

[24161] Rar-related orphan receptor b (RORB, Accession NP_008845.2) is another GAM144 target gene, herein designated TARGET GENE. RORB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RORB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RORB BINDING SITE, designated SEQ ID:8536, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24162] Another function of GAM144 is therefore inhibition of Rar-related orphan receptor b (RORB, Accession NP_008845.2), a gene which is an orphan nuclear receptor. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORB.

[24163] The function of RORB has been established by previous

studies. ROR- beta is a transcription factor and belongs to the nuclear receptor family (Carlberg et al., 1994). Members of this superfamily share a common modular structure composed of a transactivation domain, a DNA- binding domain, and a ligand- binding domain (Evans, 1988). Typically, their transcriptional transactivation function is regulated by small lipophilic molecules, such as steroid hormones, vitamin D, retinoic acids, and thyroid hormone. These molecules are synthesized in the organism and pass readily through the plasma membrane to reach the corresponding receptors inside the cell. In addition to the classic hormone receptors, a growing number of nuclear receptors for which no ligands are known have been identified by homology cloning. These nuclear receptors are referred to as 'orphan' nuclear receptors. ROR- beta is such an orphan nuclear receptor, forming a subfamily with the closely related nuclear receptors ROR- alpha (RORA; 600825) and ROR- gamma (RORC; 602943

[24164] Animal model experiments lend further support to the function of RORB. ROR- beta is expressed in areas of the central nervous system that are involved in the processing of sensory information, including spinal cord, thalamus, and sensory cerebellar cortices. Additionally, ROR- beta

localizes to the 3 principal anatomic components of the mammalian timing system: the suprachiasmatic nuclei, the retina, and the pineal gland. Andre et al. (1998) showed that RORB mRNA levels oscillate in retina and pineal gland with a circadian rhythm that persists in constant darkness. They generated RORB- deficient mice by gene targeting in embryonic stem cells and analyzed their phenotypic behavior. Rorb - /- mice display a duck- like gait, transient male incapability to reproduce sexually, and a severely disorganized retina that suffers from postnatal degeneration. Consequently, adult Rorb - /- mice are blind, yet their circadian activity rhythm is still entrained by light- dark cycles. Under conditions of constant darkness, Rorb - /- mice display an extended period of free- running rhythmicity. The overall behavioral phenotype of Rorb - /- mice, together with the chromosomal localization of the gene on mouse chromosome 4, suggested a close relationship to the spontaneous mouse mutation 'vacillans' described by Sirlin (1956) and now thought to be extinct

[24165] It is appreciated that the abovementioned animal model for RORB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[24166] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24167] Evans, R. M. : The steroid and thyroid hormone receptor superfamily. Science 240: 889- 895, 1988. ; and

[24169] Further studies establishing the function and utilities of RORB are found in John Hopkins OMIM database record ID 601972, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ribosomal protein s15 (RPS15, Accession NP_001009.1) is another GAM144 target gene, herein designated TARGET GENE. RPS15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPS15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPS15 BINDING SITE, designated SEQ ID:18606, to the nucleotide sequence of GAM144 RNA, herein designated

GAM RNA, also designated SEQ ID:361.

[24170] Another function of GAM144 is therefore inhibition of Ribosomal protein s15 (RPS15, Accession NP_001009.1), a gene which is a component of the small 40S ribosomal subunit. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS15.

[24171] The function of RPS15 has been established by previous studies. The gene called Rig (rat insulinoma gene) was first isolated from a cDNA library of rat insulinomas. Its cognate gene has been found to be activated in various human tumors such as insulinomas, esophageal cancers, and colon cancers. Inoue et al. (1987) isolated a human insulinoma cDNA encoding the human homolog of Rig. Structural analysis indicated that the predicted 145-amino acid RIG protein may be a DNA- binding protein. Shiga et al. (1990) isolated the genomic sequence of human RIG from a genomic DNA library constructed from a human esophageal carcinoma and determined its complete nucleotide sequence. The gene is composed of about 3,000 nucleotides and divided into 4 exons separated by 3 introns. The transcription initiation site was located - 46 bp upstream from the first ATG codon. Because

of CpG islands in the 5- prime region and regions with a high GC content and because of the wide expression of RIG in tissues and cells, Shiga et al. (1990) suggested that RIG may belong to the class of 'housekeeping' genes, whose products are necessary for the growth of all cell types. The human genome contains at least 6 copies of RIG pseudogenes, 4 of which have the characteristics of processed pseudogenes. Kitagawa et al. (1991) demonstrated the normal function of Rig. They showed that the immunoreactivity to a monoclonal antibody against the deduced Rig protein and the translation product of Rig mRNA comigrated with ribosomal protein S15. The amino acid sequence of ribosomal protein S15 purified from rat liver coincided with that deduced from the nucleotide sequence of Rig mRNA, but there were indications that the initiator methionine was removed and the succeeding alanyl residue was monoacetylated. The authors concluded that the product of the Rig gene is ribosomal protein S15. By somatic cell hybrid and radiation hybrid mapping analyses, Kenmochi et al. (1998) mapped the human RPS15 gene to 19p.

[24172]

[24173] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[24174] Kitagawa, M.; Takasawa, S.; Kikuchi, N.; Itoh, T.; Teraoka, H.; Yamamoto, H.; Okamoto, H. : Rig encodes ribosomal protein S15: the primary structure of mammalian ribosomal protein S15. FEBS Lett. 283: 210- 214, 1991. ; and

[24175] Kenmochi, N.; Kawaguchi, T.; Rozen, S.; Davis, E.; Goodman, N.; Hudson, T. J.; Tanaka, T.; Page, D. C. : A map of 75 human ribosomal protein genes. Genome Res. 8: 509-523, 1998.

[24176] Further studies establishing the function and utilities of RPS15 are found in John Hopkins OMIM database record ID 180535, and in cited publications listed in Table 5, which are hereby incorporated by reference.SCAM-1 (Accession NP_005766.2) is another GAM144 target gene, herein designated TARGET GENE. SCAM-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCAM-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCAM-1 BINDING SITE, designated SEQ ID:8414, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA,

also designated SEQ ID:361.

[24177] Another function of GAM144 is therefore inhibition of SCAM-1 (Accession NP_005766.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAM-1.

[24178] Stearoyl-coa desaturase (delta-9-desaturase) (SCD, Accession NP_005054.2) is another GAM144 target gene, herein designated TARGET GENE. SCD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:10595, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24179] Another function of GAM144 is therefore inhibition of Stearoyl-coa desaturase (delta-9-desaturase) (SCD, Accession NP_005054.2), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD.

[24180] The function of SCD has been established by previous studies. Stearoyl- CoA desaturase (SCD; EC 1.14.99.5) is an iron- containing enzyme that catalyzes a rate- limiting step in the synthesis of unsaturated fatty acids. The principal product of SCD is oleic acid, which is formed by desaturation of stearic acid. The ratio of stearic acid to oleic acid has been implicated in the regulation of cell growth and differentiation through effects on cell- membrane fluidity and signal transduction (Zhang et al. (1999)). Thiede et al. (1986) isolated cDNAs encoding rat SCD. By RT- PCR of adipose tissue RNA with primers based on the sequence of rat SCD, Li et al. (1994) isolated a partial human SCD cDNA. Using RNase protection assays, the authors found that human SCD was expressed at higher levels in colon and esophageal carcinomas than in the counterpart normal tissues.

[24181] Animal model experiments lend further support to the function of SCD. SCD is a central lipogenic enzyme catalyzing the synthesis of monounsaturated fatty acids, mainly oleate (C18:1) and palmitoleate (C16:1), which are components of membrane phospholipids, triglycerides, wax esters, and cholesterol esters. Several SCD isoforms (SCD1, - 2, and - 3) exist in the mouse. Ntambi et al.

(2002) showed that mice with a targeted disruption of the SCD1 isoform had reduced body adiposity, increased insulin (OMIM Ref. No. 176730) sensitivity, and resistance to diet- induced weight gain. The protection from obesity involved increased energy expenditure and increased oxygen consumption. Compared with wildtype mice, the SCD1- /- mice had increased levels of plasma ketone bodies but reduced levels of plasma insulin and leptin. In these homozygous null mice, the expression of several genes of lipid oxidation was upregulated, whereas lipid synthesis genes were downregulated. These observations suggested that a consequence of SCD1 deficiency is an activation of lipid oxidation in addition to reduced triglyceride synthesis and storage.

[24182] It is appreciated that the abovementioned animal model for SCD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24183] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24184] Ntambi, J. M.; Miyazaki, M.; Stoehr, J. P.; Lan, H.; Kendziorski, C. M.; Yandell, B. S.; Song, Y.; Cohen, P.;

[24186] Further studies establishing the function and utilities of SCD are found in John Hopkins OMIM database record ID 604031, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sialic acid binding ig-like lectin 10 (SIGLEC10, Accession NP_149121.2) is another GAM144 target gene, herein designated TARGET GENE. SIGLEC10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIGLEC10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIGLEC10 BINDING SITE, designated SEQ ID:17706, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24187] Another function of GAM144 is therefore inhibition of

Sialic acid binding ig-like lectin 10 (SIGLEC10, Accession NP_149121.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC10.

[24188] SIT (Accession NP_055265.1) is another GAM144 target gene, herein designated TARGET GENE. SIT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIT BINDING SITE, designated SEQ ID:3507, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24189] Another function of GAM144 is therefore inhibition of SIT (Accession NP_055265.1), a gene which recruits tyrosine phosphatase SHP2 to the cell membrane. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIT.

[24190] The function of SIT has been established by previous studies. By tryptic peptide sequence analysis of a 30/40-kD disulfide- linked homodimeric glycoprotein that had

been copurified with TRIM, followed by searching an EST database, Marie- Cardine et al. (1999) identified a cDNA encoding a deduced 196- amino acid protein that they designated SIT. Sequence analysis predicted that SIT has a putative 22- amino acid hydrophobic leader peptide, an 18- amino acid extracellular domain containing a potential N- glycosylation site and a cys residue that may be involved in an interchain disulfide bond, a 20- amino acid transmembrane domain, and a 136- amino acid intracellular portion containing several potential phosphorylation sites. SIT also contains 6 tyrosine residues, 5 of which may be involved in Src (OMIM Ref. No. 190090) homology- 2 (SH2) domain- mediated protein- protein interactions after phosphorylation. The cytoplasmic portion of SIT possesses a potential immunoreceptor tyrosine-based inhibitory motif, or ITIM, suggesting the potential for interactions with SHP1 (PTPN6; 176883) or SHP2 (PTPN11; 176876). Western blot analysis demonstrated that SIT is expressed as an approximately 40- kD protein that is reduced to approximately 20 kD by endoglycosidase treatment. Northern blot analysis detected strong expression of an approximately 1.6- kb SIT transcript in thymus, with lower expression detected in spleen and

lymph nodes. Weak expression was detected in peripheral blood leukocytes, bone marrow, and T cell lines, but no expression was detected in monocytic cell lines. Immunofluorescence microscopy and immunoprecipitation analysis localized overexpressed SIT in cell membranes. Western blot analysis showed that SIT is a substrate for the Src protein kinases FYN (OMIM Ref. No. 137025) and LCK (OMIM Ref. No. 153390), as well as for ZAP70 (OMIM Ref. No. 176947). Overexpressed SIT was shown to act as a negative regulator for transcriptional activity of the nuclear factor of activated T cells (NFAT; OMIM Ref. No. 600489) via a mechanism upstream of phospholipase C (see OMIM Ref. No. PLCG1; 172420), and SIT recruits SHP2 but not SHP1 to the cell membrane via the ITIM. Hubener et al. (2001) determined that the SIT gene contains 5 exons and spans 1.8 kb of genomic DNA. The SIT promoter demonstrated strong transcriptional activity and potential binding sites for both ubiquitous and lymphoid- specific transcription factors

[24191]

[24192] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24193] Hubener, C.; Mincheva, A.; Lichter, P.; Schraven, B.; Bruyns, E. : Complete sequence, genomic organization, and chromosomal localization of the human gene encoding the SHP2- interacting transmembrane adaptor protein (SIT). Immunogenetics 53: 337- 341, 2001. ; and

[24195] Further studies establishing the function and utilities of SIT are found in John Hopkins OMIM database record ID 604964, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 12 (potassium/chloride transporters), member 7 (SLC12A7, Accession NP_006589.1) is another GAM144 target gene, herein designated TARGET GENE. SLC12A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC12A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:8621, to the nucleotide sequence of GAM144 RNA, herein designated

GAM RNA, also designated SEQ ID:361.

[24196] Another function of GAM144 is therefore inhibition of Solute carrier family 12 (potassium/chloride transporters), member 7 (SLC12A7, Accession NP_006589.1), a gene which is a potassium/chloride- cotransporter. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7.

[24197] The function of SLC12A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM105.1.Solute carrier family 26 (sulfate transporter), member 2 (SLC26A2, Accession NP_000103.1) is another GAM144 target gene, herein designated TARGET GENE. SLC26A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC26A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC26A2 BINDING SITE, designated SEQ ID:5087, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24198] Another function of GAM144 is therefore inhibition of So-

lute carrier family 26 (sulfate transporter), member 2 (SLC26A2, Accession NP_000103.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A2.

[24199] Solute carrier family 2 (facilitated glucose transporter), member 6 (SLC2A6, Accession NP_060055.1) is another GAM144 target gene, herein designated TARGET GENE. SLC2A6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A6 BINDING SITE, designated SEQ ID:8775, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24200] Another function of GAM144 is therefore inhibition of Solute carrier family 2 (facilitated glucose transporter), member 6 (SLC2A6, Accession NP_060055.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A6.

[24201] Solute carrier family 4, sodium bicarbonate transporter-

like, member 11 (SLC4A11, Accession NP_114423.1) is another GAM144 target gene, herein designated TARGET GENE. SLC4A11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC4A11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC4A11 BINDING SITE, designated SEQ ID:6573, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24202] Another function of GAM144 is therefore inhibition of Solute carrier family 4, sodium bicarbonate transporter-like, member 11 (SLC4A11, Accession NP_114423.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A11.

[24203] Solute carrier family 7 (cationic amino acid transporter, y+ system), member 5 (SLC7A5, Accession NP_003477.3) is another GAM144 target gene, herein designated TARGET GENE. SLC7A5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC7A5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC7A5 BINDING SITE, designated SEQ ID:17430, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24204] Another function of GAM144 is therefore inhibition of Solute carrier family 7 (cationic amino acid transporter, y+ system), member 5 (SLC7A5, Accession NP_003477.3), a gene which mediates transport of large and small neutral amino acids. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A5.

[24205] The function of SLC7A5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM98.1.SMP3 (Accession NP_079439.2) is another GAM144 target gene, herein designated TARGET GENE. SMP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMP3 BINDING SITE, designated SEQ ID:7660, to the nu-

cleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24206] Another function of GAM144 is therefore inhibition of SMP3 (Accession NP_079439.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMP3.

[24207] Smt3 suppressor of mif two 3 homolog 1 (yeast) (SMT3H1, Accession NP_008867.1) is another GAM144 target gene, herein designated TARGET GENE. SMT3H1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMT3H1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMT3H1 BINDING SITE, designated SEQ ID:11346, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24208] Another function of GAM144 is therefore inhibition of Smt3 suppressor of mif two 3 homolog 1 (yeast) (SMT3H1, Accession NP_008867.1), a gene which is involved in the function and/or structure of the eukaryotic kinetochore. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with SMT3H1.

[24209] The function of SMT3H1 has been established by previous studies. TEXT Lapenta et al. (1997) used cDNA selection to isolate coding sequences from cosmids mapping to the gene- rich telomeric region of human chromosome 21q. A cDNA, which the authors termed SMT3A, was isolated and mapped between the loci PFKL and D21S171 on 21q22.3, about 2.2 Mb proximal to the telomere. The predicted protein of 103 amino acids was found to be a homolog of the S. cerevisiae SMT3 protein, whose gene was previously isolated as a suppressor of mutations in the MIF2 gene (Meluh and Koshland, 1995). The yeast MIF2 gene encodes an essential centromeric protein and shows homology to mammalian CENPC (see OMIM Ref. No. 117141), an integral component of active kinetochores (Meluh and Koshland, 1995). The proposed role of yeast SMT3 as a centromeric protein and the strong evolutionary conservation of the human SMT3A gene suggested to Lapenta et al. (1997) that the encoded protein is involved in the function and/or structure of the eukaryotic kinetochore. SMT3A is also highly homologous to ubiquitin (OMIM Ref. No. 191320). Lapenta et al. (1997) identified 2 additional human SMT3- like sequences, named SMT3B (OMIM Ref.

No. 603042) and SMT3C (OMIM Ref. No. 601912), as expressed sequence tags; SMT3A shares 87% amino acid identity with SMT3B and 47% identity with SMT3C.

[24210]

[24211] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24212] Lapenta, V.; Chiurazzi, P.; van der Spek, P.; Pizzuti, A.; Hanaoka, F.; Brahe, C. : SMT3A, a human homologue of the S. cerevisiae SMT3 gene, maps to chromosome 21qter and defines a novel gene family. Genomics 40: 362- 366, 1997. ; and

[24213] Meluh, P. B.; Koshland, D. : Suppressors of MIF2, a putative centromere protein gene in Saccharomyces cerevisiae. (Abstract) Molec. Biol. Cell 6 (supp.): 360a only, 1995.

[24214] Further studies establishing the function and utilities of SMT3H1 are found in John Hopkins OMIM database record ID 602231, and in cited publications listed in Table 5, which are hereby incorporated by reference.Serum response factor (c-fos serum response element-binding transcription factor) (SRF, Accession NP_003122.1) is another GAM144 target gene, herein designated TARGET GENE. SRF BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by SRF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:7478, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24215] Another function of GAM144 is therefore inhibition of Serum response factor (c-fos serum response element-binding transcription factor) (SRF, Accession NP_003122.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF.

[24216] Synaptotagmin iii (SYT3, Accession NP_115674.1) is another GAM144 target gene, herein designated TARGET GENE. SYT3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SYT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYT3 BINDING SITE, designated SEQ ID:20170, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24217] Another function of GAM144 is therefore inhibition of Synaptotagmin iii (SYT3, Accession NP_115674.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT3.

[24218] Transcription factor 2, hepatic; lf-b3; variant hepatic nuclear factor (TCF2, Accession NP_006472.1) is another GAM144 target gene, herein designated TARGET GENE. TCF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TCF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE, designated SEQ ID:15301, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24219] Another function of GAM144 is therefore inhibition of Transcription factor 2, hepatic; lf-b3; variant hepatic nuclear factor (TCF2, Accession NP_006472.1), a gene which probably binds to the inverted palindrome 5'- gttaatnattaac- 3'. and therefore is associated with Maturity- onset diabetes of the young type 5 (mody5), familial hypoplastic

glomerulocystic kidney disease (gckd). Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Maturity- onset diabetes of the young type 5 (mody5), familial hypoplastic glomerulocystic kidney disease (gckd), and of other diseases and clinical conditions associated with TCF2.

[24220] The function of TCF2 has been established by previous studies. Abbott et al. (1990) isolated and partially sequenced a human clone corresponding to the gene for liver- specific transcription factor LFB3. Furthermore, they designed oligonucleotide primers for TCF2 (also called HNF1B) and used them to amplify specifically the human gene in human/rodent somatic cell hybrids by the polymerase chain reaction. They showed that TCF2 maps to 17q between the centromere and the breakpoint of acute promyelocytic leukemia, i.e., proximal to 17q22. Hepatocyte nuclear factor- 1 (HNF1A, or TCF1; 142410) is a homeodomain- containing transcriptional activator required for the liver- specific expression of a variety of genes. Bach et al. (1991) isolated a cDNA clone from a human liver library encoding a protein, designated HNF1B, that is highly homologous to HNF1A (also called TCF1) in 3 regions, including the homeo domain and the dimeriza-

tion domain. They showed that this protein can heterodimerize with human HNF1A in vitro. Sequence comparison with a rat variant HNF1A identified the cDNA as the human homolog. HNF1B is a nuclear protein recognizing the same binding site as HNF1A. By Northern blot analysis, Bach et al. (1991) showed that the HNF1B transcripts are present in differentiated human HepG2 hepatoma cells as well as in rat liver and that this transcript level is 10- to 20- fold lower than that of HNF1A. They assigned the HNF1B gene to human chromosome 17 and mouse chromosome 11. The HNF1A gene maps to human chromosome 12 and mouse chromosome 5.

[24221]

[24222] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24223] Abbott, C.; Piaggio, G.; Ammendola, R.; Solomon, E.; Povey, S.; Gounari, F.; De Simone, V.; Cortese, R. : Mapping of the gene TCF2 for the transcription factor LFB3 to human chromosome 17 by polymerase chain reaction. Genomics 8: 165- 167, 1990. ; and

[24224] Bach, I.; Mattei, M.- G.; Cereghini, S.; Yaniv, M. : Two members of an HNF1 homeoprotein family are expressed

in human liver. Nucleic Acids Res. 19: 3553- 3559, 1991.

[24225] Further studies establishing the function and utilities of TCF2 are found in John Hopkins OMIM database record ID 189907, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-cell leukemia/ lymphoma 6 (TCL6, Accession NP_065575.1) is another GAM144 target gene, herein designated TARGET GENE. TCL6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE, designated SEQ ID:13217, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24226] Another function of GAM144 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession NP_065575.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[24227] T-cell leukemia/lymphoma 6 (TCL6, Accession NP_055233.1) is another GAM144 target gene, herein

designated TARGET GENE. TCL6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE, designated SEQ ID:13217, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24228] Another function of GAM144 is therefore inhibition of T-cell leukemia/lymphoma 6 (TCL6, Accession NP_055233.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6.

[24229] Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NP_068581.1) is another GAM144 target gene, herein designated TARGET GENE. TGIF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGIF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:15336, to the nucleotide sequence of

GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24230] Another function of GAM144 is therefore inhibition of Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NP_068581.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2.

[24231] Tigger transposable element derived 6 (TIGD6, Accession NP_112215.1) is another GAM144 target gene, herein designated TARGET GENE. TIGD6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIGD6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIGD6 BINDING SITE, designated SEQ ID:7598, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24232] Another function of GAM144 is therefore inhibition of Tigger transposable element derived 6 (TIGD6, Accession NP_112215.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIGD6.

[24233] Triple homeobox 1 (TIX1, Accession NP_055850.1) is an-

other GAM144 target gene, herein designated TARGET GENE. TIX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:720, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24234] Another function of GAM144 is therefore inhibition of Triple homeobox 1 (TIX1, Accession NP_055850.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIX1.

[24235] Transmembrane 4 superfamily member 6 (TM4SF6, Accession NP_003261.1) is another GAM144 target gene, herein designated TARGET GENE. TM4SF6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TM4SF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TM4SF6 BINDING SITE, designated SEQ ID:6282, to the nucleotide sequence

of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24236] Another function of GAM144 is therefore inhibition of Transmembrane 4 superfamily member 6 (TM4SF6, Accession NP_003261.1), a gene which plays a role in the regulation of cell development, activation, growth and motility. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF6.

[24237] The function of TM4SF6 has been established by previous studies. Members of the transmembrane 4 (or tetraspanin) superfamily (TM4SF) contain 4 hydrophobic, presumably membrane- spanning sequences and a major presumed extracellular loop between the third and fourth hydrophobic domains. Several TM4SF proteins have been shown to stimulate or modulate cell growth, and some may associate with integrin and control cell adhesion and movement. Maeda et al. (1998) isolated a human glioma cDNA that has sequence similarity to the TM4SF member TM4SF2 (OMIM Ref. No. 300096). By screening a human fetal lung cDNA library with a probe corresponding to the combined sequences of this cDNA and of an overlapping EST, they isolated cDNAs with an open reading frame en-

coding a deduced 245- amino acid protein termed TM4SF6. The TM4SF6 protein contains 4 putative transmembrane domains, several short cysteine motifs characteristic of TM4SF proteins, and a potential N- glycosylation site. The TM4SF6 and TM4SF2 proteins are 58% homologous. TM4SF6 was expressed as 1.9- and 1.3- kb transcripts in all human tissues examined.

[24238]

[24239] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24240] Maeda, K.; Matsuhashi, S.; Hori, K.; Xin, Z.; Mukai, T.; Tabuchi, K.; Egashira, M.; Niikawa, N. : Cloning and characterization of a novel human gene, TM4SF6, encoding a protein belonging to the transmembrane 4 superfamily, and mapped to Xq22. Genomics 52: 240- 242, 1998. ; and

[24241] Todd, S. C.; Doctor, V. S.; Levy, S. : Sequences and expression of six new members of the tetraspanin/TM4SF family. Biochim. Biophys. Acta 1399: 101- 104, 1998.

[24242] Further studies establishing the function and utilities of TM4SF6 are found in John Hopkins OMIM database record ID 300191, and in cited publications listed in Table 5,

which are hereby incorporated by reference.TRAM2 (Accession NP_036420.1) is another GAM144 target gene, herein designated TARGET GENE. TRAM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRAM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRAM2 BINDING SITE, designated SEQ ID:12299, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24243] Another function of GAM144 is therefore inhibition of TRAM2 (Accession NP_036420.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAM2.

[24244] Tripartite motif-containing 14 (TRIM14, Accession NP_150090.1) is another GAM144 target gene, herein designated TARGET GENE. TRIM14 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRIM14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

TRIM14 BINDING SITE, designated SEQ ID:3991, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24245] Another function of GAM144 is therefore inhibition of Tripartite motif-containing 14 (TRIM14, Accession NP_150090.1), a gene which is composed of 3 zinc- binding domains and is involved in development and cell growth. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14.

[24246] The function of TRIM14 has been established by previous studies. TRIM proteins are composed of 3 zinc- binding domains, a RING, a B- box type 1, and a B- box type 2, followed by a coiled- coil region. They are involved in development and cell growth. By sequencing cDNAs randomly selected from a cDNA library derived from the human immature myeloid cell line KG- 1, Nagase et al. (1995) identified a partial cDNA encoding TRIM14, which they called KIAA0129. The deduced 406- amino acid protein is 25% identical to RFP (OMIM Ref. No. 602165). Northern blot analysis revealed wide expression of KIAA0129 that was highest in liver but undetectable in skeletal muscle.

[24247]

[24248] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24249] Nagase, T.; Seki, N.; Tanaka, A.; Ishikawa, K.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. IV. The coding sequences of 40 new genes (KIAA0121- KIAA0160) deduced by analysis of cDNA clones from human cell line KG- 1. DNA Res. 2: 167- 174, 1995. ; and

[24251] Further studies establishing the function and utilities of TRIM14 are found in John Hopkins OMIM database record ID 606556, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tripartite motif-containing 14 (TRIM14, Accession NP_055603.2) is another GAM144 target gene, herein designated TARGET GENE. TRIM14 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRIM14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM14 BINDING SITE, designated SEQ ID:3991, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24252] Another function of GAM144 is therefore inhibition of Tripartite motif-containing 14 (TRIM14, Accession NP_055603.2), a gene which is composed of 3 zinc- binding domains and is involved in development and cell growth. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14.

[24253] The function of TRIM14 has been established by previous studies. TRIM proteins are composed of 3 zinc- binding domains, a RING, a B- box type 1, and a B- box type 2, followed by a coiled- coil region. They are involved in development and cell growth. By sequencing cDNAs randomly selected from a cDNA library derived from the human immature myeloid cell line KG- 1, Nagase et al. (1995) identified a partial cDNA encoding TRIM14, which they called KIAA0129. The deduced 406- amino acid protein is 25% identical to RFP (OMIM Ref. No. 602165). Northern blot analysis revealed wide expression of

KIAA0129 that was highest in liver but undetectable in skeletal muscle.

[24254]

[24255] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24256] Nagase, T.; Seki, N.; Tanaka, A.; Ishikawa, K.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. IV. The coding sequences of 40 new genes (KIAA0121- KIAA0160) deduced by analysis of cDNA clones from human cell line KG- 1. DNA Res. 2: 167- 174, 1995. ; and

[24257] Reymond, A.; Meroni, G.; Fantozzi, A.; Merla, G.; Cairo, S.; Luzi, L.; Riganelli, D.; Zanaria, E.; Messali, S.; Cainarca, S.; Guffanti, A.; Minucci, S.; Pelicci, P. G.; Ballabio, A. : T.

[24258] Further studies establishing the function and utilities of TRIM14 are found in John Hopkins OMIM database record ID 606556, and in cited publications listed in Table 5, which are hereby incorporated by reference.TSARG1 (Accession NP_620712.2) is another GAM144 target gene, herein designated TARGET GENE. TSARG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TSARG1, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TSARG1 BINDING SITE, designated SEQ ID:9635, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24259] Another function of GAM144 is therefore inhibition of TSARG1 (Accession NP_620712.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSARG1.

[24260] Uridine monophosphate kinase (UMPK, Accession NP_036606.2) is another GAM144 target gene, herein designated TARGET GENE. UMPK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by UMPK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UMPK BINDING SITE, designated SEQ ID:2776, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24261] Another function of GAM144 is therefore inhibition of Uridine monophosphate kinase (UMPK, Accession

NP_036606.2), a gene which catalyzes the phosphorylation of uridine monophosphate to uridine diphosphate. and therefore may be associated with Hemophilus influenzae type b. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Hemophilus influenzae type b, and of other diseases and clinical conditions associated with UMPK.

[24262] The function of UMPK has been established by previous studies. This enzyme (EC 2.7.4.4) catalyzes the first step in the production of the pyrimidine nucleoside triphosphates required for RNA and DNA synthesis, namely the phosphorylation of uridine monophosphate to uridine diphosphate. Giblett et al. (1974) found genetic polymorphism of UMPK by means of starch gel electrophoresis. Family studies provided evidence for 3 alleles- - UMPK1, UMPK2, and UMPK3- - at an autosomal locus. The UMPK1 allele was associated with about 3 times the catalytic activity of the UMPK2 allele, so that UMPK2 homozygotes are relatively deficient of the enzyme. Two of 3 UMPK2 homozygotes were children with prolonged respiratory infection. This suggested to Giblett et al. (1974) that the ability of immunocompetent lymphocytes to respond to appropriate stimuli is impaired in the UMPK2 homozygote

in a manner similar to the immune defect resulting from adenosine deaminase deficiency. Alaskan Eskimos have the highest known prevalence of invasive Hemophilus influenzae type B disease, primarily meningitis: in 1 to 5% of all children in the first 2 years of life. In this population a polymorphic variant of UMPK, UMPK- 3, is positively associated with invasive HIB disease (relative risk 3.3). No difference in levels of naturally acquired HIB anticapsular antibodies between persons with HIB disease and health controls was found. Thus, the UMPK- 3 allele may have a role in mediating nonhumoral immunity to HIB (Petersen et al., 1985). Giblett et al. (1975) showed that UMPK and Rh (OMIM Ref. No. 111700) are linked (lod score of 2.313 at theta 0.05 on the basis of 4 families). (Rh is located on 1p36.2- p34. Cook and Hamerton (1979) gave 1p32 as the SRO of UMPK.) Satlin et al. (1975) assigned UMPK to chromosome 1 by study of somatic cell hybrids. Using somatic cell hybrids between a mouse cell line deficient in uridine kinase and human cells (Medrano and Green, 1974), Ruddle and Creagan (1975) provisionally assigned UK to chromosome 1. The Goss- Harris method of mapping combined features of recombinational study in families and synteny tests in hybrid cells. As applied to chro-

mosome 1, the method showed that AK2 and UMPK are distal to PGM1 and that the order of the loci is PGM1: UMPK: (AK2, alpha- FUC): ENO1 (Goss and Harris, 1977). Data on gene frequencies of allelic variants were tabulated by Roychoudhury and Nei (1988).

[24263]

[24264] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24265] Giblett, E. R.; Anderson, J. E.; Chen, S.- H.; Teng, Y.- S.; Cohen, F. : Uridine monophosphate kinase: a new genetic polymorphism with possible clinical implications. Am. J. Hum. Genet. 26: 627- 635, 1974. ; and

[24266] Roychoudhury, A. K.; Nei, M. : Human Polymorphic Genes: World Distribution. New York: Oxford Univ. Press (pub.) 1988.

[24267] Further studies establishing the function and utilities of UMPK are found in John Hopkins OMIM database record ID 191710, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ubiquitin specific protease 14 (trna-guanine transglycosylase) (USP14, Accession NP_005142.1) is another GAM144 target gene, herein designated TARGET GENE. USP14 BINDING SITE is a

target binding site found in the 5` untranslated region of mRNA encoded by USP14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP14 BINDING SITE, designated SEQ ID:11260, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24268] Another function of GAM144 is therefore inhibition of Ubiquitin specific protease 14 (trna-guanine transglycosylase) (USP14, Accession NP_005142.1), a gene which is similar to ubiquitin- specific cysteine (thiol) proteases and tRNA- guanine transglycosylase. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP14.

[24269] The function of USP14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Ubiquitin specific protease 22 (USP22, Accession XP_042698.2) is another GAM144 target gene, herein designated TARGET GENE. USP22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP22, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP22 BINDING SITE, designated SEQ ID:7093, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24270] Another function of GAM144 is therefore inhibition of Ubiquitin specific protease 22 (USP22, Accession XP_042698.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP22.

[24271] Wap four-disulfide core domain 1 (WFDC1, Accession NP_067020.2) is another GAM144 target gene, herein designated TARGET GENE. WFDC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by WFDC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WFDC1 BINDING SITE, designated SEQ ID:7098, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24272] Another function of GAM144 is therefore inhibition of Wap four-disulfide core domain 1 (WFDC1, Accession NP_067020.2), a gene which is a secretory protein and

functions as a growth inhibitor. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WFDC1.

[24273] The function of WFDC1 has been established by previous studies. The rat ps20 protein was originally identified as a secreted growth inhibitor (Rowley, 1992; Rowley and Tindall, 1987) and purified to homogeneity from a fetal rat urogenital sinus mesenchymal cell line (Rowley et al., 1995). Larsen et al. (1998) cloned the rat cDNA and found that it contains a WAP- type four- disulfide core motif, indicating it may function as a protease inhibitor. By screening a human prostate cDNA library with a partial rat ps20 cDNA clone as probe, Larsen et al. (2000) cloned a full-length WFDC1 cDNA encoding a deduced 220- amino acid protein containing a WAP- type four- disulfide core motif. They also cloned the mouse homolog and found that the human WFDC1 protein shares approximately 86% and 88% identity with the rat and mouse proteins, respectively. Both the mouse and human WFDC1 genes contain 7 exons. By fluorescence in situ hybridization (FISH), Larsen et al. (2000) mapped the WFDC1 gene to chromosome 16q24, an area of frequent loss of heterozygosity (LOH) in cancers, including prostate, breast and hepatocellular

cancers and Wilms tumor. The LOH, combined with the growth inhibitory properties of the gene product (ps20), suggested that WFDC1 is a tumor suppressor gene. By co-hybridizing telomeric and WFDC1 probes in their FISH analyses, Larsen et al. (2000) found that WFDC1 is located in subband 16q24.3, less that 2 Mb from the telomere.

[24274]

[24275] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24276] Rowley, D. R.; Dang, T. D.; Larsen, M.; Gerdes, M. J.; McBride, L.; Lu, B. : Purification of a novel protein (ps20) from urogenital sinus mesenchymal cells with growth inhibitory properties in vitro. J. Biol. Chem. 270: 22058-22065, 1995. ; and

[24277] Larsen, M.; Ressler, S. J.; Gerdes, M. J.; Lu, B.; Byron, M.; Lawrence, J. B.; Rowley, D. R. : The WFDC1 gene encoding ps20 localizes to 16q24, a region of LOH in multiple cancers. Mammali.

[24278] Further studies establishing the function and utilities of WFDC1 are found in John Hopkins OMIM database record ID 605322, and in cited publications listed in Table 5, which are hereby incorporated by reference.WFDC13

(Accession NP_742002.1) is another GAM144 target gene, herein designated TARGET GENE. WFDC13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WFDC13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WFDC13 BINDING SITE, designated SEQ ID:5225, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24279] Another function of GAM144 is therefore inhibition of WFDC13 (Accession NP_742002.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WFDC13.

[24280] X-ray repair complementing defective repair in chinese hamster cells 2 (XRCC2, Accession NP_005422.1) is another GAM144 target gene, herein designated TARGET GENE. XRCC2 BINDING SITE1 and XRCC2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by XRCC2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of XRCC2 BINDING SITE1 and XRCC2 BINDING SITE2, designated SEQ ID:11760 and SEQ ID:18231 respectively, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24281] Another function of GAM144 is therefore inhibition of X-ray repair complementing defective repair in chinese hamster cells 2 (XRCC2, Accession NP_005422.1), a gene which involves in the homologous recombination repair (hrr) pathway of double- stranded dna. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC2.

[24282] The function of XRCC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.ZD52F10 (Accession NP_201574.1) is another GAM144 target gene, herein designated TARGET GENE. ZD52F10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZD52F10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of ZD52F10 BINDING SITE, designated SEQ ID:10953, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24283] Another function of GAM144 is therefore inhibition of ZD52F10 (Accession NP_201574.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZD52F10.

[24284] Zinc finger protein 64 homolog (mouse) (ZFP64, Accession NP_071371.2) is another GAM144 target gene, herein designated TARGET GENE. ZFP64 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ZFP64, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP64 BINDING SITE, designated SEQ ID:10150, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24285] Another function of GAM144 is therefore inhibition of Zinc finger protein 64 homolog (mouse) (ZFP64, Accession NP_071371.2) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ZFP64.

[24286] Zinc finger protein, multitype 2 (ZFPM2, Accession NP_036214.1) is another GAM144 target gene, herein designated TARGET GENE. ZFPM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFPM2 BINDING SITE, designated SEQ ID:10564, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24287] Another function of GAM144 is therefore inhibition of Zinc finger protein, multitype 2 (ZFPM2, Accession NP_036214.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFPM2.

[24288] Zinc finger protein 19 (kox 12) (ZNF19, Accession NP_690871.1) is another GAM144 target gene, herein designated TARGET GENE. ZNF19 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF19, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF19 BINDING SITE, designated SEQ ID:5130, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24289] Another function of GAM144 is therefore inhibition of Zinc finger protein 19 (kox 12) (ZNF19, Accession NP_690871.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF19.

[24290] Zinc finger protein 19 (kox 12) (ZNF19, Accession NP_008892.1) is another GAM144 target gene, herein designated TARGET GENE. ZNF19 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF19 BINDING SITE, designated SEQ ID:5130, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24291] Another function of GAM144 is therefore inhibition of Zinc finger protein 19 (kox 12) (ZNF19, Accession

NP_008892.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF19.

[24292] Zinc finger protein 297 (ZNF297, Accession NP_005444.3) is another GAM144 target gene, herein designated TARGET GENE. ZNF297 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF297 BINDING SITE, designated SEQ ID:408, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24293] Another function of GAM144 is therefore inhibition of Zinc finger protein 297 (ZNF297, Accession NP_005444.3) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF297.

[24294] Zinc finger protein 313 (ZNF313, Accession NP_061153.1) is another GAM144 target gene, herein designated TARGET GENE. ZNF313 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF313, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF313 BINDING SITE, designated SEQ ID:8636, to the nucleotide sequence of GAM144 RNA, herein designated GAM RNA, also designated SEQ ID:361.

[24295] Another function of GAM144 is therefore inhibition of Zinc finger protein 313 (ZNF313, Accession NP_061153.1) . Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF313.

[24296]

[24297] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 145 (GAM145), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24298] GAM145 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM145 was detected is described hereinabove with reference to Figs. 8-15.

[24299] GAM145 gene, herein designated GAM GENE, and GAM145 target gene, herein designated TARGET GENE,

are human genes contained in the human genome.

[24300] GAM145 gene encodes a GAM145 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM145 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM145 precursor RNA is designated SEQ ID:82, and is provided hereinbelow with reference to the sequence listing part.

[24301] GAM145 precursor RNA folds onto itself, forming GAM145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24302] GAM145 precursor RNA folds onto itself, forming GAM145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[24303] Nucleotide sequence of GAM145 precursor RNA, designated SEQ-ID: 82, and a schematic representation of a predicted secondary folding of GAM145 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[24304] An enzyme complex designated DICER COMPLEX, `dices` the GAM145 folded precursor RNA into GAM145 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM145 RNA is designated SEQ ID:335, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[24305] GAM145 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM145 target

RNA, herein designated GAM TARGET RNA. GAM145 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24306] GAM145 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM145 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM145 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM145 RNA may have a different number of target binding sites in untranslated regions of a GAM145 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[24307] The complementary binding of GAM145 RNA, herein designated GAM RNA, to target binding sites on GAM145 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM145 target RNA into GAM145 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24308] It is appreciated that GAM145 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM145 target genes. The mRNA of each one of this plurality of GAM145 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM145 RNA, herein designated GAM RNA, and which when bound by GAM145 RNA causes inhibition of translation of respective one or more GAM145 target proteins.

[24309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM145 gene, herein designated GAM GENE, on one or more GAM145 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes.

As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24310] It is appreciated that specific functions and accordingly utilities of GAM145 correlate with, and may be deduced from, the identity of the target genes which GAM145 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24311]

[24312]

[24313] DRIL2 (Accession NM_006465.1) is a GAM145 target gene, herein designated TARGET GENE. DRIL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DRIL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:6283, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24314] A function of GAM145 is therefore inhibition of DRIL2 (Accession NM_006465.1) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2.

[24315] FLJ10737 (Accession NM_018198.1) is another GAM145 target gene, herein designated TARGET GENE. FLJ10737 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10737 BINDING SITE, designated SEQ ID:15643, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24316] Another function of GAM145 is therefore inhibition of FLJ10737 (Accession NM_018198.1) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10737.

[24317] FLJ14129 (Accession NM_030895.1) is another GAM145 target gene, herein designated TARGET GENE. FLJ14129 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14129, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14129 BINDING SITE, designated SEQ ID:9578, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24318] Another function of GAM145 is therefore inhibition of FLJ14129 (Accession NM_030895.1) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14129.

[24319] G protein-coupled receptor kinase 7 (GPRK7, Accession NM_139209.1) is another GAM145 target gene, herein designated TARGET GENE. GPRK7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPRK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of GPRK7 BINDING SITE, designated SEQ ID:19163, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24320] Another function of GAM145 is therefore inhibition of G protein-coupled receptor kinase 7 (GPRK7, Accession NM_139209.1), a gene which regulates the G protein-coupled receptors. Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7.

[24321] The function of GPRK7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.KIAA1266 (Accession) is another GAM145 target gene, herein designated TARGET GENE. KIAA1266 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1266 BINDING SITE, designated SEQ ID:4524, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24322] Another function of GAM145 is therefore inhibition of KIAA1266 (Accession) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1266.

[24323] KIAA1715 (Accession XM_042834.2) is another GAM145 target gene, herein designated TARGET GENE. KIAA1715 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:11841, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24324] Another function of GAM145 is therefore inhibition of KIAA1715 (Accession XM_042834.2) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715.

[24325] LOC122726 (Accession) is another GAM145 target gene, herein designated TARGET GENE. LOC122726 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC122726, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC122726 BINDING SITE, designated SEQ ID:1477, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24326] Another function of GAM145 is therefore inhibition of LOC122726 (Accession) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122726.

[24327] LOC129303 (Accession) is another GAM145 target gene, herein designated TARGET GENE. LOC129303 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC129303, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC129303 BINDING SITE, designated SEQ ID:10922, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24328] Another function of GAM145 is therefore inhibition of LOC129303 (Accession) . Accordingly, utilities of

GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129303.

[24329] LOC132617 (Accession) is another GAM145 target gene, herein designated TARGET GENE. LOC132617 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC132617, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132617 BINDING SITE, designated SEQ ID:847, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24330] Another function of GAM145 is therefore inhibition of LOC132617 (Accession) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132617.

[24331] LOC146332 (Accession) is another GAM145 target gene, herein designated TARGET GENE. LOC146332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146332, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146332 BINDING SITE, designated SEQ ID:14632, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24332] Another function of GAM145 is therefore inhibition of LOC146332 (Accession) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146332.

[24333] LOC149501 (Accession XM_059930.8) is another GAM145 target gene, herein designated TARGET GENE. LOC149501 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149501, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149501 BINDING SITE, designated SEQ ID:20044, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24334] Another function of GAM145 is therefore inhibition of LOC149501 (Accession XM_059930.8) . Accordingly, utilities of GAM145 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149501.

[24335] LOC150397 (Accession XM_086907.1) is another GAM145 target gene, herein designated TARGET GENE. LOC150397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:5916, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24336] Another function of GAM145 is therefore inhibition of LOC150397 (Accession XM_086907.1) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397.

[24337] LOC219654 (Accession) is another GAM145 target gene, herein designated TARGET GENE. LOC219654 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219654, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:17991, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24338] Another function of GAM145 is therefore inhibition of LOC219654 (Accession) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654.

[24339] LOC255042 (Accession) is another GAM145 target gene, herein designated TARGET GENE. LOC255042 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255042 BINDING SITE, designated SEQ ID:13776, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24340] Another function of GAM145 is therefore inhibition of LOC255042 (Accession) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255042.

[24341] Mitochondrial ribosomal protein s24 (MRPS24, Accession NM_032014.1) is another GAM145 target gene, herein designated TARGET GENE. MRPS24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPS24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS24 BINDING SITE, designated SEQ ID:17157, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24342] Another function of GAM145 is therefore inhibition of Mitochondrial ribosomal protein s24 (MRPS24, Accession NM_032014.1) . Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS24.

[24343] Rab31, member ras oncogene family (RAB31, Accession NM_006868.1) is another GAM145 target gene, herein designated TARGET GENE. RAB31 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB31 BINDING SITE, designated SEQ ID:3423, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24344] Another function of GAM145 is therefore inhibition of Rab31, member ras oncogene family (RAB31, Accession NM_006868.1), a gene which is an GTP- binding protein of the RAB family. Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB31.

[24345] The function of RAB31 has been established by previous studies. Chen et al. (1996) isolated a cDNA encoding RAB31, a small GTP- binding protein of the RAB family, from a human melanocyte cDNA library and from melanoma cells. The deduced 194- amino acid RAB31 protein, which the authors referred to as RAB22B, appeared to be an isoform of the human homolog of canine Rab22. Northern blot analysis detected a major transcript of 4.0 kb in all tissues tested and a minor transcript of 1.0 kb in tissues with relatively high expression, such as testis, ovary, lung, and leukocytes. By somatic cell hybrid analysis, Chen et al. (1996) mapped the RAB31 gene to chromosomes 18. Scott (2001) localized the RAB31 gene

to 18p11.3 based on sequence similarity between the RAB31 sequence (GenBank U57091) and a chromosome 18 clone (GenBank AP000876).

[24346]

[24347] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24348] Chen, D.; Guo, J.; Miki, T.; Tachibana, M.; Gahl, W. A. : Molecular cloning of two novel rab genes from human melanocytes. Gene 174: 129- 134, 1996. ; and

[24349] Scott, A. F. : Personal Communication. Baltimore, Md., 2/26/2001.

[24350] Further studies establishing the function and utilities of RAB31 are found in John Hopkins OMIM database record ID 605694, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Wolf-hirschhorn syndrome candidate 1 (WHSC1, Ac-cession NM_133332.1) is another GAM145 target gene, herein designated TARGET GENE. WHSC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WHSC1, corre-sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:6879, to the nucleotide sequence of GAM145 RNA, herein designated GAM RNA, also designated SEQ ID:335.

[24351] Another function of GAM145 is therefore inhibition of Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1), a gene which binds covalently to and repairs g/t mismatches. and therefore may be associated with Wolf- hirschhorn syndrome. Accordingly, utilities of GAM145 include diagnosis, prevention and treatment of Wolf- hirschhorn syndrome, and of other diseases and clinical conditions associated with WHSC1.

[24352] The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.

[24353] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 146 (GAM146), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24354] GAM146 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM146 was detected is described hereinabove with reference to Figs. 8-15.

[24355] GAM146 gene, herein designated GAM GENE, and GAM146 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[24356] GAM146 gene encodes a GAM146 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM146 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM146 precursor RNA is designated SEQ ID:20, and is provided hereinbelow with reference to the sequence listing part.

[24357] GAM146 precursor RNA folds onto itself, forming GAM146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24358] GAM146 precursor RNA folds onto itself, forming GAM146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[24359] Nucleotide sequence of GAM146 precursor RNA, designated SEQ-ID: 20, and a schematic representation of a predicted secondary folding of GAM146 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[24360] An enzyme complex designated DICER COMPLEX, `dices` the GAM146 folded precursor RNA into GAM146 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM146 RNA is desig-

nated SEQ ID:370, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[24361] GAM146 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM146 target RNA, herein designated GAM TARGET RNA. GAM146 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24362] GAM146 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM146 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM146 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM146 RNA may have a different number of target

binding sites in untranslated regions of a GAM146 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24363] The complementary binding of GAM146 RNA, herein designated GAM RNA, to target binding sites on GAM146 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM146 target RNA into GAM146 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24364] It is appreciated that GAM146 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM146 target genes. The mRNA of each one of this plurality of GAM146 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM146 RNA, herein designated GAM RNA, and which when bound by GAM146 RNA causes inhibition of translation of respective one or more GAM146 target proteins.

[24365] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM146 gene, herein designated GAM GENE, on one or more GAM146 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24366] It is appreciated that specific functions and accordingly utilities of GAM146 correlate with, and may be deduced from, the identity of the target genes which GAM146 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24367]

[24368]

[24369] ASIC4 (Accession NM_018674.2) is a GAM146 target gene, herein designated TARGET GENE. ASIC4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ASIC4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASIC4 BINDING SITE, designated SEQ ID:15460, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24370] A function of GAM146 is therefore inhibition of ASIC4 (Accession NM_018674.2), a gene which is a proton-gated, amiloride- sensitive sodium channel. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASIC4.

[24371] The function of ASIC4 has been established by previous studies. Grunder et al. (2000) isolated a cDNA corresponding to the human ASIC4 gene from a pituitary gland- specific cDNA library. Human ASIC4 protein shares 97% identity with its rat homolog. Dot- blot analysis and abundance of ASIC4 cDNAs in the pituitary cDNA library indicated strong expression in pituitary gland. By RT-

PCR, Grunder et al. (2000) demonstrated expression in vestibular system and very faint expression in organ of Corti. ASIC4 could not be activated by a drop in extracellular pH in Xenopus oocytes, suggesting association with other subunits or activation by a ligand other than protons As the ASIC4 gene mapped in close proximity to the locus for paroxysmal dystonic choreoathetosis (PDC; 118800) on chromosome 2q, Grunder et al. (2001) sequenced the entire coding region and adjacent intronic sequences in an affected member of a large PDC family in which the disorder had been shown to be linked to the PDC locus on chromosome 2. Although 3 amino acid substitution polymorphisms were identified, none was disease- specific.

[24372]

[24373] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24374] Grunder, S.; Geisler, H.- S.; Rainer, S.; Fink, J. K. : Acid-sensing ion channel (ASIC) 4 gene: physical mapping, genomic organisation, and evaluation as a candidate for paroxysmal dystonia. Europ. J. Hum. Genet. 9: 672- 676, 2001. ; and

[24375] Grunder, S.; Geissler, H.- S.; Bassler, E.- L.; Ruppersberg,

J. P. : A new member of acid- sensing ion channels from pituitary gland. Neuroreport 11: 1607- 1611, 2000.

[24376] Further studies establishing the function and utilities of ASIC4 are found in John Hopkins OMIM database record ID 606715, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atpase, class v, type 10d (ATP10D, Accession NM_020453.2) is another GAM146 target gene, herein designated TARGET GENE. ATP10D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP10D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP10D BINDING SITE, designated SEQ ID:19772, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24377] Another function of GAM146 is therefore inhibition of Atpase, class v, type 10d (ATP10D, Accession NM_020453.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10D.

[24378] Beta-site app-cleaving enzyme (BACE, Accession NM_138973.1) is another GAM146 target gene, herein

designated TARGET GENE. BACE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE, designated SEQ ID:4746, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24379] Another function of GAM146 is therefore inhibition of Beta-site app-cleaving enzyme (BACE, Accession NM_138973.1), a gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with BACE.

[24380] The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Bcl2-like 1 (BCL2L1, Accession NM_001191.2) is another GAM146 target gene, herein designated TARGET GENE. BCL2L1 BINDING SITE is a target binding site

found in the 3` untranslated region of multiple transcripts of mRNA encoded by BCL2L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL2L1 BINDING SITE, designated SEQ ID:4366, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24381] Another function of GAM146 is therefore inhibition of Bcl2-like 1 (BCL2L1, Accession NM_001191.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L1.

[24382] B double prime 1, subunit of rna polymerase iii transcription initiation factor iiib (BDP1, Accession NM_018429.1) is another GAM146 target gene, herein designated TARGET GENE. BDP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BDP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BDP1 BINDING SITE, designated SEQ ID:15772, to the nucleotide sequence of GAM146 RNA,

herein designated GAM RNA, also designated SEQ ID:370.

[24383] Another function of GAM146 is therefore inhibition of B double prime 1, subunit of rna polymerase iii transcription initiation factor iiib (BDP1, Accession NM_018429.1), a gene which activates RNA polymerase III transcription. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDP1.

[24384] The function of BDP1 has been established by previous studies. Using a cDNA walking strategy, Kelter et al. (2000) cloned overlapping partial sequences of TFNR from fetal brain and spinal cord libraries. The deduced 2,254-amino acid protein has a calculated molecular mass of 250 kD. All cDNAs isolated from one fetal brain cDNA library lacked exon 15 resulting in a truncated protein of 796 amino acids. The TFNR protein is highly hydrophilic. It contains a 55- amino acid motif that is repeated as 6 highly conserved and 3 less well- conserved copies encoded by exon 17. It also contains a bipartite nuclear localization signal, a DNA- ligase A1 ATP- dependent (OMIM Ref. No. 126391) binding site, and a second bipartite nuclear localization signal in the C terminus. Sequence comparison with the first 11 exons of mouse Tfnr, encod-

ing 545 amino acids, indicated 77% identity to the human TFNR protein. A stretch of over 300 amino acids of human TFNR showed 29% identity with the yeast TFC5 protein, a component of the TFIIIB transcription initiation complex. Northern blot analysis detected weak expression of 9.5-, 3.1-, and 1.6- kb transcripts in all tissues examined, and a 1.9- kb transcript expressed only in brain. Analysis of mRNAs from several brain areas showed a strong signal at 9.5 and 1.9 kb in cerebellum, and a weak signal in all other brain areas. Western blot analysis of fetal and adult human tissues showed 5 bands ranging from 55 to 250 kD. Immunofluorescent localization of TFNR in HeLa cells revealed a punctate nuclear staining pattern. With use of anti- BDP1 antibodies in in vitro transcription reactions, Schramm et al. (2000) determined that BPD1 is required for transcription from the Ad2 VAI and human U6 RNA polymerase III promoters. By chromatin immunoprecipitation assays, they also found that BDP1 binds the U6 promoter region in vivo, further suggesting that BDP1 is part of the U6 initiation complex

[24385]

[24386] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[24387] Kelter, A.- R.; Herchenbach, J.; Wirth, B. : The transcription factor- like nuclear regulator (TFNR) contains a novel 55- amino- acid motif repeated nine times and maps closely to SMN1. Genomics 70: 315- 326, 2000. ; and

[24388] Schramm, L.; Pendergrast, P. S.; Sun, Y.; Hernandez, N. : Different human TFIIB activities direct RNA polymerase III transcription from TATA- containing and TATA- less promoters. Genes De.

[24389] Further studies establishing the function and utilities of BDP1 are found in John Hopkins OMIM database record ID 607012, and in cited publications listed in Table 5, which are hereby incorporated by reference.Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458.1) is another GAM146 target gene, herein designated TARGET GENE. BSN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BSN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:7928, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24390] Another function of GAM146 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458.1), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release and therefore may be associated with Multiple system atrophy (msa). Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of Multiple system atrophy (msa), and of other diseases and clinical conditions associated with BSN.

[24391] The function of BSN has been established by previous studies. Both the presynaptic terminal and the postsynaptic compartment of neuronal synapses comprise a highly specialized cytoskeleton underlying the synaptic membranes. The presynaptic nerve terminal is the principal site of regulated neurotransmitter release. The active zone is the region of the presynaptic plasmalemma over which synaptic vesicles dock, fuse, and release neurotransmitter. Piccolo (PCLO; 604918), a 420- kD protein, is 1 component of the presynaptic cytomatrix. Tom Dieck et al. (1998) isolated a large (greater than 400 kD) protein in mouse that is also found in the presynaptic compartments of rat brain synapses. They designated the protein Bassoon because it, along with Piccolo, is part of the ensem-

ble of presynaptic proteins that are involved in orchestrating events at the nerve terminal. Bassoon is found in axon terminals of hippocampal neurons where it is highly concentrated in the vicinity of the active zone. Piccolo has a similar distribution and colocalizes with Bassoon in cultured hippocampal cells. Tom Dieck et al. (1998) suggested that Bassoon may be involved in cytomatrix organization at the site of neurotransmitter release Multiple system atrophy (MSA) is a sporadic progressive neurodegenerative disease. By differential hybridization to high-density cDNA filters, Hashida et al. (1998) identified human frontal lobe cDNAs with altered expression patterns in MSA patients. One partial cDNA whose expression was elevated 2- fold in MSA cerebella encoded a protein that the authors designated ZNF231 (zinc finger protein- 231). By screening additional libraries with the partial cDNA, they assembled a full- length ZNF231 cDNA. The predicted 3,926- amino acid protein contains 2 glycine- proline dipeptide repeats, a pair of homologous C8 double zinc finger motifs, a leucine zipper motif, an SH3 domain-binding motif, 2 nuclear targeting sequences, 2 glutamine- rich domains, and a histidine- rich domain. Northern blot analysis of rat tissues indicated that the

ZNF231 gene was expressed as a 16- kb mRNA specifically in brain. By RT- PCR of human brain cell lines and tissue, Hashida et al. (1998) determined that ZNF231 was expressed in the cerebellum and in a neuroblastoma cell line, but not in the white matter. Ishikawa et al. (1997) recovered a ZNF231 cDNA, designated KIAA0434, as 1 of 78 brain cDNAs that may encode large proteins. Gundelfinger (1999) stated that ZNF231 is the human homolog of Bassoon

[24392]

[24395] Hashida, H.; Goto, J.; Zhao, N.; Takahashi, N.; Hirai, M.; Kanazawa, I.; Sakaki, Y. : Cloning and mapping of ZNF231, a novel brain- specific gene encoding neuronal double

zinc finger prot.

[24396] Further studies establishing the function and utilities of BSN are found in John Hopkins OMIM database record ID 604020, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome 17 open reading frame 31 (C17orf31, Accession NM_017575.2) is another GAM146 target gene, herein designated TARGET GENE. C17orf31 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C17orf31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:17622, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24397] Another function of GAM146 is therefore inhibition of Chromosome 17 open reading frame 31 (C17orf31, Accession NM_017575.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31.

[24398] Chromosome 20 open reading frame 150 (C20orf150, Accession XM_037265.3) is another GAM146 target gene,

herein designated TARGET GENE. C20orf150 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf150, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf150 BINDING SITE, designated SEQ ID:13347, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24399] Another function of GAM146 is therefore inhibition of Chromosome 20 open reading frame 150 (C20orf150, Accession XM_037265.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf150.

[24400] C20orf180 (Accession) is another GAM146 target gene, herein designated TARGET GENE. C20orf180 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf180, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf180 BINDING SITE, designated SEQ ID:3334, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA,

also designated SEQ ID:370.

[24401] Another function of GAM146 is therefore inhibition of C20orf180 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf180.

[24402] Chromosome 20 open reading frame 188 (C20orf188, Accession NM_015638.1) is another GAM146 target gene, herein designated TARGET GENE. C20orf188 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf188, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf188 BINDING SITE, designated SEQ ID:5330, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24403] Another function of GAM146 is therefore inhibition of Chromosome 20 open reading frame 188 (C20orf188, Accession NM_015638.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf188.

[24404] Chromosome 6 open reading frame 31 (C6orf31, Accession NM_030651.2) is another GAM146 target gene,

herein designated TARGET GENE. C6orf31 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C6orf31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf31 BINDING SITE, designated SEQ ID:9476, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24405] Another function of GAM146 is therefore inhibition of Chromosome 6 open reading frame 31 (C6orf31, Accession NM_030651.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf31.

[24406] CG012 (Accession XM_096710.2) is another GAM146 target gene, herein designated TARGET GENE. CG012 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CG012, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:19685, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA,

also designated SEQ ID:370.

[24407] Another function of GAM146 is therefore inhibition of CG012 (Accession XM_096710.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012.

[24408] Chromatin accessibility complex 1 (CHRAC1, Accession NM_017444.3) is another GAM146 target gene, herein designated TARGET GENE. CHRAC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHRAC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:19743, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24409] Another function of GAM146 is therefore inhibition of Chromatin accessibility complex 1 (CHRAC1, Accession NM_017444.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1.

[24410] CLIPR-59 (Accession NM_015526.1) is another GAM146 target gene, herein designated TARGET GENE. CLIPR-59

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLIPR-59, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLIPR-59 BINDING SITE, designated SEQ ID:1749, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24411] Another function of GAM146 is therefore inhibition of CLIPR-59 (Accession NM_015526.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR-59.

[24412] Colony stimulating factor 1 receptor, formerly mcdonough feline sarcoma viral (v-fms) oncogene homolog (CSF1R, Accession NM_005211.2) is another GAM146 target gene, herein designated TARGET GENE. CSF1R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CSF1R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSF1R BINDING SITE, designated SEQ ID:8995, to the nucleotide sequence of

GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24413] Another function of GAM146 is therefore inhibition of Colony stimulating factor 1 receptor, formerly mcdonough feline sarcoma viral (v-fms) oncogene homolog (CSF1R, Accession NM_005211.2), a gene which is involved in regulation of growth and differentiation of myeloid cells and therefore may be associated with Myeloid malignancy, predisposition to. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of Myeloid malignancy, predisposition to, and of other diseases and clinical conditions associated with CSF1R.

[24414] The function of CSF1R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Deiodinase, iodothyronine, type ii (DIO2, Accession NM_000793.2) is another GAM146 target gene, herein designated TARGET GENE. DIO2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DIO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

DIO2 BINDING SITE, designated SEQ ID:18574, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24415] Another function of GAM146 is therefore inhibition of Deiodinase, iodothyronine, type ii (DIO2, Accession NM_000793.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2.

[24416] DKFZP564C1940 (Accession) is another GAM146 target gene, herein designated TARGET GENE. DKFZP564C1940 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP564C1940, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564C1940 BINDING SITE, designated SEQ ID:7189, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24417] Another function of GAM146 is therefore inhibition of DKFZP564C1940 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C1940.

[24418] DKFZP586P0123 (Accession XM_170681.3) is another GAM146 target gene, herein designated TARGET GENE. DKFZP586P0123 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP586P0123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586P0123 BINDING SITE, designated SEQ ID:18201, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24419] Another function of GAM146 is therefore inhibition of DKFZP586P0123 (Accession XM_170681.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586P0123.

[24420] Eukaryotic translation initiation factor 1a, y chromosome (EIF1AY, Accession NM_004681.1) is another GAM146 target gene, herein designated TARGET GENE. EIF1AY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF1AY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of EIF1AY BINDING SITE, designated SEQ ID:741, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24421] Another function of GAM146 is therefore inhibition of Eukaryotic translation initiation factor 1a, y chromosome (EIF1AY, Accession NM_004681.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1AY.

[24422] Erythrocyte membrane protein band 4.1-like 1 (EPB41L1, Accession NM_012156.1) is another GAM146 target gene, herein designated TARGET GENE. EPB41L1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EPB41L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:7094, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24423] Another function of GAM146 is therefore inhibition of Erythrocyte membrane protein band 4.1-like 1 (EPB41L1, Accession NM_012156.1) . Accordingly, utilities of GAM146

include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1.

[24424] F-box and wd-40 domain protein 1b (FBXW1B, Accession NM_033644.1) is another GAM146 target gene, herein designated TARGET GENE. FBXW1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE, designated SEQ ID:13218, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24425] Another function of GAM146 is therefore inhibition of F-box and wd-40 domain protein 1b (FBXW1B, Accession NM_033644.1), a gene which somehow is involved in the process of neuronal cell differentiation or brain development. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B.

[24426] The function of FBXW1B has been established by previous studies. Using a yeast 2- hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al.

(1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F- box proteins, respectively. These contained C termini with leucine- rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). By searching an EST database for homologs of BTRCP, followed by RT- PCR on gastric cancer cell lines and screening fetal brain and fetal lung cDNA libraries, Koike et al. (2000) obtained cDNAs encoding 3 isoforms of FBXW1B, which they termed BTRCP2A, BTRCP2B, and BTRCP2C. Sequence analysis predicted that the 3 isoforms share the same N- terminal 15 amino acids, F box, and 7 C- terminal WD repeats. The 525- amino acid BTRCP2B protein has a 21- amino acid insert after met15 of the 508- amino acid BTRCP2A protein, and BTRCP2C has a 34- amino acid insert after met15 of BTRCP2A. BTRCP2A is 86% identical to BTRCP. BTRCP2C is nearly identical to the KIAA0696 protein identified by Ishikawa et al. (1998). By genomic sequence analysis, Koike et al. (2000) determined that the FBXW1B gene contains at least 14 exons, with BTRCP2A lacking exons 2 and 3, BTRCP2B lacking exon 2, and BTRCP2C lacking exon 3. Northern blot analysis revealed near ubiquitous expres-

sion of a 4.5- kb transcript. By RT- PCR analysis, Ishikawa et al. (1998) detected expression in all tissues tested except spleen.

[24427]

[24428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24429] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 5: 169- 176, 1998. ; and

[24430] Koike, J.; Sagara, N.; Kirikoshi, H.; Takagi, A.; Miwa, T.; Hirai, M.; Katoh, M. : Molecular cloning and genomic structure of the beta- TRCP2 gene on chromosome 5q35.1. Biochem. Biophys.

[24431] Further studies establishing the function and utilities of FBXW1B are found in John Hopkins OMIM database record ID 605651, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ00026 (Accession XM_036307.7) is another GAM146 target gene, herein designated TARGET GENE. FLJ00026 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ00026, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00026 BINDING SITE, designated SEQ ID:8652, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24432] Another function of GAM146 is therefore inhibition of FLJ00026 (Accession XM_036307.7) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00026.

[24433] FLJ10057 (Accession NM_017984.2) is another GAM146 target gene, herein designated TARGET GENE. FLJ10057 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10057 BINDING SITE, designated SEQ ID:3965, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24434] Another function of GAM146 is therefore inhibition of FLJ10057 (Accession NM_017984.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10057.

[24435] FLJ12221 (Accession XM_031342.1) is another GAM146 target gene, herein designated TARGET GENE. FLJ12221 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12221, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12221 BINDING SITE, designated SEQ ID:5264, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24436] Another function of GAM146 is therefore inhibition of FLJ12221 (Accession XM_031342.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12221.

[24437] FLJ14346 (Accession NM_025029.1) is another GAM146 target gene, herein designated TARGET GENE. FLJ14346 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ14346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14346 BINDING SITE, designated SEQ ID:9772, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24438] Another function of GAM146 is therefore inhibition of FLJ14346 (Accession NM_025029.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14346.

[24439] FLJ20489 (Accession NM_017842.1) is another GAM146 target gene, herein designated TARGET GENE. FLJ20489 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20489, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20489 BINDING SITE, designated SEQ ID:579, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24440] Another function of GAM146 is therefore inhibition of

FLJ20489 (Accession NM_017842.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20489.

[24441] FLJ20509 (Accession NM_017851.1) is another GAM146 target gene, herein designated TARGET GENE. FLJ20509 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20509, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20509 BINDING SITE, designated SEQ ID:14324, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24442] Another function of GAM146 is therefore inhibition of FLJ20509 (Accession NM_017851.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20509.

[24443] FLJ20546 (Accession NM_017872.2) is another GAM146 target gene, herein designated TARGET GENE. FLJ20546 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20546, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20546 BINDING SITE, designated SEQ ID:502, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24444] Another function of GAM146 is therefore inhibition of FLJ20546 (Accession NM_017872.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20546.

[24445] FLJ21791 (Accession) is another GAM146 target gene, herein designated TARGET GENE. FLJ21791 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21791, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21791 BINDING SITE, designated SEQ ID:5000, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24446] Another function of GAM146 is therefore inhibition of FLJ21791 (Accession) . Accordingly, utilities of GAM146

include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21791.

[24447] FLJ22865 (Accession NM_025109.2) is another GAM146 target gene, herein designated TARGET GENE. FLJ22865 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22865 BINDING SITE, designated SEQ ID:18657, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24448] Another function of GAM146 is therefore inhibition of FLJ22865 (Accession NM_025109.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22865.

[24449] Flavin containing monooxygenase 2 (FMO2, Accession NM_001460.1) is another GAM146 target gene, herein designated TARGET GENE. FMO2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FMO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FMO2 BINDING SITE, designated SEQ ID:2634, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24450] Another function of GAM146 is therefore inhibition of Flavin containing monooxygenase 2 (FMO2, Accession NM_001460.1), a gene which catalyzes the n- oxidation of primary alkylamines to their oximes via an n- hydroxy-lamine intermediate. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMO2.

[24451] The function of FMO2 has been established by previous studies. The flavin- containing monooxygenases (FMOs; EC 1.14.13.8) are NADPH- dependent flavoenzymes that catalyze the oxidation of heteroatom centers in numerous drugs and xenobiotics. See FMO1 (OMIM Ref. No. 136130). FMO2, or pulmonary FMO, is 1 of 5 forms of the enzyme identified in mammals. It is expressed predominantly in lung and differs from other FMOs in that it can catalyze the N- oxidation of certain primary alkylamines. By screening a human lung library with a rabbit FMO2 cDNA, Dolphin et al. (1998) isolated human FMO2 cDNAs. The human FMO2 transcript contains a premature stop

codon and thus encodes a predicted 471- amino acid protein that is 64 residues shorter than the FMO2 proteins of other mammals such as rabbit, guinea pig, and macaque monkey. The nonsense mutation that leads to production of the truncated human protein is not present in the FMO2 gene of closely related primates, and must therefore have arisen in the human lineage after the divergence of humans from their closest relative, the chimpanzee. RNase protection assays indicated that the human FMO2 gene was expressed predominantly in lung. However, Dolphin et al. (1998) noted that a previous study had shown that FMO2 protein was undetectable in all but 1 of 29 human lung samples (Williams et al., 1990). They suggested that the truncated human FMO2 protein is unable to fold correctly and is rapidly degraded. Heterologous expression studies demonstrated that human FMO2 is catalytically inactive. Thus, this situation is similar to those of the urate oxidase (UOX; 191540), gulonolactone oxidase (GULOP; 240400), and cytidine monophospho- n-acetylneuraminic acid hydroxylase (CMAH; 603209) gene products, which are active in most mammals but are nonfunctional in the human. By PCR analysis of somatic cell hybrids, McCombie et al. (1996) mapped the FMO2 gene

to 1q, a region containing the FMO1, FMO3 (OMIM Ref. No. 136132), and FMO4 (OMIM Ref. No. 136131) genes.

[24452]

[24453] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24454] Dolphin, C. T.; Beckett, D. J.; Janmohamed, A.; Cullingford, T. E.; Smith, R. L.; Shephard, E. A.; Phillips, I. R. : The flavin- containing monooxygenase 2 gene (FMO2) of humans, but not of other primates, encodes a truncated, nonfunctional protein. J. Biol. Chem. 273: 30599- 30607, 1998. ; and

[24455] McCombie, R. R.; Dolphin, C. T.; Povey, S.; Phillips, I. R.; Shephard, E. A. : Localization of human flavin- containing monooxygenase genes FMO2 and FMO5 to chromosome 1q. Genomics 34: 4.

[24456] Further studies establishing the function and utilities of FMO2 are found in John Hopkins OMIM database record ID 603955, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gonadotropin-releasing hormone 1 (leutinizing-releasing hormone) (GNRH1, Accession NM_000825.2) is another GAM146 target gene, herein

designated TARGET GENE. GNRH1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GNRH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNRH1 BINDING SITE, designated SEQ ID:2156, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24457] Another function of GAM146 is therefore inhibition of Gonadotropin-releasing hormone 1 (leutinizing-releasing hormone) (GNRH1, Accession NM_000825.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNRH1.

[24458] Histone deacetylase 6 (HDAC6, Accession NM_006044.2) is another GAM146 target gene, herein designated TARGET GENE. HDAC6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HDAC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HDAC6 BINDING SITE, designated SEQ ID:7208, to the nucleotide sequence of GAM146 RNA,

herein designated GAM RNA, also designated SEQ ID:370.

[24459] Another function of GAM146 is therefore inhibition of Histone deacetylase 6 (HDAC6, Accession NM_006044.2), a gene which plays an important role in transcriptional regulation, cell cycle progression and developmental events (by similarity). Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC6.

[24460] The function of HDAC6 has been established by previous studies. By searching an EST database for sequences similar to yeast Hda1, followed by screening a cDNA library and PCR, Grozinger et al. (1999) identified cDNAs encoding the class II HDACs HDAC4, HDAC5 (OMIM Ref. No. 605315), and HDAC6. Sequence analysis predicted that the 1,216- amino acid HDAC6 protein consists of an apparent internal dimer containing 2 highly homologous catalytic domains, the first beginning at residue 215 and the second at residue 610. Northern blot analysis detected expression of a 5.0- kb HDAC6 transcript that was highest in heart, liver, kidney, and pancreas. Functional analysis confirmed that HDAC6 possesses deacetylation activity against all 4 core histones and that the 2 catalytic domains function independently. Western blot analysis

showed that HDAC6 is expressed as a 131- kD protein that does not coimmunoprecipitate with other HDACs or transcription factors. Grozinger et al. (1999) speculated that HDAC6 may not interact with histones in vivo but may deacetylate other substrates. Hubbert et al. (2002) demonstrated that HDAC6 functions as a tubulin deacetylase. HDAC6 is localized exclusively in the cytoplasm, where it associates with microtubules and localizes with the microtubule motor complex (see OMIM Ref. No. 601143). In vivo the overexpression of HDAC6 led to a global deacetylation of alpha- tubulin, whereas a decrease in HDAC6 increased alpha- tubulin acetylation. In vitro, purified HDAC6 potently deacetylated alpha- tubulin in assembled microtubules. Furthermore, overexpression of HDAC6 promoted chemotactic cell movement, supporting the idea that HDAC6- mediated deacetylation regulates microtubule- dependent cell motility. Hubbert et al. (2002) concluded that HDAC6 is the tubulin deacetylase, and provided evidence that reversible acetylation regulates important biologic processes beyond histone metabolism and gene transcription.

[24461]

[24462] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[24463] Grozinger, C. M.; Hassig, C. A.; Schreiber, S. L. : Three proteins define a class of human histone deacetylases related to yeast Hda1p. Proc. Nat. Acad. Sci. 96: 4868-4873, 1999. ; and

[24464] Hubbert, C.; Guardiola, A.; Shao, R.; Kawaguchi, Y.; Ito, A.; Nixon, A.; Yoshida, M.; Wang, X.- F.; Yao, T.- P. : HDAC6 is a microtubule- associated deacetylase. Nature 417: 455- 458, 2002.

[24465] Further studies establishing the function and utilities of HDAC6 are found in John Hopkins OMIM database record ID 300272, and in cited publications listed in Table 5, which are hereby incorporated by reference.HIP-55 (Accession NM_014063.3) is another GAM146 target gene, herein designated TARGET GENE. HIP-55 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIP-55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIP-55 BINDING SITE, designated SEQ ID:8753, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:370.

[24466] Another function of GAM146 is therefore inhibition of HIP-55 (Accession NM_014063.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP-55.

[24467] Insulin-like growth factor binding protein 1 (IGFBP1, Accession NM_000596.1) is another GAM146 target gene, herein designated TARGET GENE. IGFBP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IGFBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGFBP1 BINDING SITE, designated SEQ ID:11301, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24468] Another function of GAM146 is therefore inhibition of Insulin-like growth factor binding protein 1 (IGFBP1, Accession NM_000596.1), a gene which prolongs the half- life of the igfs and inhibit or stimulate their growth promoting effects on cell culture. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP1.

[24469] The function of IGFBP1 has been established by previous studies. Unlike insulin, both IGF- I (OMIM Ref. No. 147440) and IGF- II (OMIM Ref. No. 147470) circulate in plasma tightly bound to specific binding proteins. Two major forms of IGF- binding proteins have been identified in human plasma, a low molecular weight form and a high molecular weight form. The low molecular weight IGF- binding protein is also known as IGF- BP25 and is synthesized in liver, secretory endometrium and decidua. It binds both IGF- I and IGF- II with high affinity. It may act as a paracrine regulator of cell growth. Brinkman et al. (1988) cloned and sequenced a cDNA encoding a low molecular weight IGF- binding protein from a human placenta cDNA library. Expression of the cDNA encoding what they termed 'IBP- 1' in monkey COS cells resulted in the synthesis of a 30- kD protein that binds IGF- I and is immunologically indistinguishable from the IGF- binding protein isolated from amniotic fluid or human serum. Northern blotting analysis demonstrated that expression of the IBP1 gene is limited to placental membranes and fetal liver. The gene was assigned to chromosome 7 by Southern analysis of genomic DNA isolated from human-rodent somatic cell hybrids. Brewer et al. (1988) purified

an insulin- like growth factor binding protein from human amniotic fluid and showed that it potentiates the effects of IGF- I in vitro. They used a polyclonal antibody to this protein to isolate a cDNA clone from a human decidua library. They found that the clone encodes a polypeptide of 28,832 daltons that includes sequences of 9 tryptic peptides that had been prepared from the purified protein. The protein has 15 cysteines clustered at the amino and carboxy ends of the molecule. Near its C- terminus the protein has an RGD sequence (arginine- glycine- aspartic acid) which may account for its ability to attach to cells and to potentiate the biologic actions of IGF- I. Brinkman et al. (1988) found that the IBP1 gene has 4 exons and spans 5.9 kb. Alitalo et al. (1989) localized the IBP1 gene to 7p13- p12 by in situ hybridization. Alitalo et al. (1989) described a 2- allele RFLP with allele frequencies that made it useful as a genetic marker for the proximal short arm of chromosome 7. Ekstrand et al. (1990) confirmed this assignment by Southern analysis of somatic hybrid cell DNA and by in situ hybridization. According to Ballard et al. (1990), IGFBP1 is also known as amniotic fluid binding protein (AFBP), placental protein 12, alpha- pregnancy- associated endometrial globulin, growth hormone

independent binding protein, binding protein 28, binding protein 26, and binding protein 25. IGFBP1 is elevated in the fetal circulation of human and animal pregnancies complicated by intrauterine growth retardation (IUGR) caused by placental insufficiency and in utero hypoxia and is believed to restrict fetal growth by sequestering IGFs. Popovici et al. (2001) established highly pure primary cultures of human fetal hepatocytes in vitro and investigated the expression of IGFBP1 and the effects of hypoxia on expression of IGFBP1 mRNA and protein. Hepatocytes were cultured in defined medium, and Northern blot analysis revealed expression of a 1.5- kb IGFBP1 mRNA transcript in hepatocytes cultured under normoxic conditions for 24 hours that did not increase in steady- state levels after 48 hours in culture. Under hypoxic conditions, IGFBP1 mRNA expression increased 3- to 4- fold compared with normoxic controls. Western blot analysis of conditioned medium revealed the presence of IGFBP1, IGFBP2 (OMIM Ref. No. 146731), IGFBP3 (OMIM Ref. No. 146732), and IGFBP4 (OMIM Ref. No. 146733). IGFBP1 was the most abundant IGFBP in conditioned medium, and densitometric analysis revealed a 2.5- fold increase in IGFBP1 under hypoxic, compared with normoxic, condi-

tions, supporting the immunoradiometric assay results. A 3- fold increase in IGFBP3 mRNA, but not other IGFBPs, was noted under hypoxic, compared with normoxic, conditions. The authors concluded that hypoxia upregulates fetal hepatocyte IGFBP1 mRNA steady- state levels and protein, with this being the major IGFBP derived from the fetal hepatocyte. These data also supported a role for the fetal liver as a source of elevated circulating levels of IGFBP1 in fetuses with in utero hypoxia and IUGR.

[24474] Further studies establishing the function and utilities of IGFBP1 are found in John Hopkins OMIM database record ID 146730, and in cited publications listed in Table 5, which are hereby incorporated by reference.IL-17RC (Accession NM_153461.1) is another GAM146 target gene, herein designated TARGET GENE. IL-17RC BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IL-17RC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL-17RC BINDING SITE, designated SEQ ID:14135, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24475] Another function of GAM146 is therefore inhibition of IL-17RC (Accession NM_153461.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL-17RC.

[24476] Potassium channel, subfamily k, member 10 (KCNK10, Accession NM_021161.3) is another GAM146 target gene, herein designated TARGET GENE. KCNK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KCNK10, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK10 BINDING SITE, designated SEQ ID:4467, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24477] Another function of GAM146 is therefore inhibition of Potassium channel, subfamily k, member 10 (KCNK10, Accession NM_021161.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK10.

[24478] KIAA0125 (Accession NM_014792.2) is another GAM146 target gene, herein designated TARGET GENE. KIAA0125 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE, designated SEQ ID:19077, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24479] Another function of GAM146 is therefore inhibition of KIAA0125 (Accession NM_014792.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125.

[24480] KIAA0232 (Accession XM_291106.1) is another GAM146 target gene, herein designated TARGET GENE. KIAA0232 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA0232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:12123, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24481] Another function of GAM146 is therefore inhibition of KIAA0232 (Accession XM_291106.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232.

[24482] KIAA0310 (Accession XM_088459.6) is another GAM146 target gene, herein designated TARGET GENE. KIAA0310 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0310 BINDING SITE, designated SEQ ID:9879, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24483] Another function of GAM146 is therefore inhibition of

KIAA0310 (Accession XM_088459.6) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0310.

[24484] KIAA0514 (Accession NM_014696.1) is another GAM146 target gene, herein designated TARGET GENE. KIAA0514 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:8846, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24485] Another function of GAM146 is therefore inhibition of KIAA0514 (Accession NM_014696.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514.

[24486] KIAA0561 (Accession XM_038150.2) is another GAM146 target gene, herein designated TARGET GENE. KIAA0561 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0561, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:17026, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24487] Another function of GAM146 is therefore inhibition of KIAA0561 (Accession XM_038150.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561.

[24488] KIAA0633 (Accession) is another GAM146 target gene, herein designated TARGET GENE. KIAA0633 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0633, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0633 BINDING SITE, designated SEQ ID:12019, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24489] Another function of GAM146 is therefore inhibition of KIAA0633 (Accession) . Accordingly, utilities of GAM146

include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0633.

[24490] KIAA0800 (Accession NM_014703.1) is another GAM146 target gene, herein designated TARGET GENE. KIAA0800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0800 BINDING SITE, designated SEQ ID:6315, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24491] Another function of GAM146 is therefore inhibition of KIAA0800 (Accession NM_014703.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0800.

[24492] KIAA1164 (Accession XM_045358.2) is another GAM146 target gene, herein designated TARGET GENE. KIAA1164 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:11204, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24493] Another function of GAM146 is therefore inhibition of KIAA1164 (Accession XM_045358.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164.

[24494] KIAA1200 (Accession XM_031054.5) is another GAM146 target gene, herein designated TARGET GENE. KIAA1200 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1200, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1200 BINDING SITE, designated SEQ ID:5977, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24495] Another function of GAM146 is therefore inhibition of KIAA1200 (Accession XM_031054.5) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1200.

[24496] KIAA1530 (Accession XM_042661.5) is another GAM146 target gene, herein designated TARGET GENE. KIAA1530 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1530, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:5181, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24497] Another function of GAM146 is therefore inhibition of KIAA1530 (Accession XM_042661.5) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530.

[24498] Legumain (LGMN, Accession NM_005606.3) is another GAM146 target gene, herein designated TARGET GENE. LGMN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LGMN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LGMN BINDING SITE, designated SEQ ID:12719, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24499] Another function of GAM146 is therefore inhibition of Legumain (LGMN, Accession NM_005606.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGMN.

[24500] LGP1 (Accession NM_032484.2) is another GAM146 target gene, herein designated TARGET GENE. LGP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LGP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGP1 BINDING SITE, designated SEQ ID:15097, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24501] Another function of GAM146 is therefore inhibition of LGP1 (Accession NM_032484.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGP1.

[24502] LOC115265 (Accession NM_145244.1) is another GAM146

target gene, herein designated TARGET GENE. LOC115265 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115265, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115265 BINDING SITE, designated SEQ ID:18602, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24503] Another function of GAM146 is therefore inhibition of LOC115265 (Accession NM_145244.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115265.

[24504] LOC118786 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC118786 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC118786, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118786 BINDING SITE, designated SEQ ID:9073, to the nucleotide sequence of GAM146 RNA, herein designated

GAM RNA, also designated SEQ ID:370.

[24505] Another function of GAM146 is therefore inhibition of LOC118786 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118786.

[24506] LOC123792 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC123792 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC123792, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123792 BINDING SITE, designated SEQ ID:13791, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24507] Another function of GAM146 is therefore inhibition of LOC123792 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123792.

[24508] LOC126755 (Accession XM_059074.1) is another GAM146 target gene, herein designated TARGET GENE. LOC126755

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126755, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126755 BINDING SITE, designated SEQ ID:3954, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24509] Another function of GAM146 is therefore inhibition of LOC126755 (Accession XM_059074.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126755.

[24510] LOC131827 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC131827 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131827, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131827 BINDING SITE, designated SEQ ID:15001, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24511] Another function of GAM146 is therefore inhibition of LOC131827 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131827.

[24512] LOC136337 (Accession XM_072456.3) is another GAM146 target gene, herein designated TARGET GENE. LOC136337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC136337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC136337 BINDING SITE, designated SEQ ID:8085, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24513] Another function of GAM146 is therefore inhibition of LOC136337 (Accession XM_072456.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136337.

[24514] LOC145813 (Accession XM_096873.2) is another GAM146 target gene, herein designated TARGET GENE. LOC145813 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC145813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145813 BINDING SITE, designated SEQ ID:2375, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24515] Another function of GAM146 is therefore inhibition of LOC145813 (Accession XM_096873.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145813.

[24516] LOC146506 (Accession XM_085489.1) is another GAM146 target gene, herein designated TARGET GENE. LOC146506 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146506, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146506 BINDING SITE, designated SEQ ID:13559, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24517] Another function of GAM146 is therefore inhibition of

LOC146506 (Accession XM_085489.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146506.

[24518] LOC146953 (Accession XM_085659.3) is another GAM146 target gene, herein designated TARGET GENE. LOC146953 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146953, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146953 BINDING SITE, designated SEQ ID:3124, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24519] Another function of GAM146 is therefore inhibition of LOC146953 (Accession XM_085659.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146953.

[24520] LOC147990 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC147990 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147990, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147990 BINDING SITE, designated SEQ ID:12124, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24521] Another function of GAM146 is therefore inhibition of LOC147990 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147990.

[24522] LOC148870 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC148870 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148870, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148870 BINDING SITE, designated SEQ ID:10650, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24523] Another function of GAM146 is therefore inhibition of LOC148870 (Accession) . Accordingly, utilities of

GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148870.

[24524] LOC149606 (Accession XM_086600.1) is another GAM146 target gene, herein designated TARGET GENE. LOC149606 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149606, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:17892, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24525] Another function of GAM146 is therefore inhibition of LOC149606 (Accession XM_086600.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606.

[24526] LOC150279 (Accession XM_086820.2) is another GAM146 target gene, herein designated TARGET GENE. LOC150279 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150279, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150279 BINDING SITE, designated SEQ ID:1553, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24527] Another function of GAM146 is therefore inhibition of LOC150279 (Accession XM_086820.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150279.

[24528] LOC151438 (Accession XM_098060.1) is another GAM146 target gene, herein designated TARGET GENE. LOC151438 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151438, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:10705, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24529] Another function of GAM146 is therefore inhibition of LOC151438 (Accession XM_098060.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151438.

[24530] LOC151657 (Accession XM_098100.6) is another GAM146 target gene, herein designated TARGET GENE. LOC151657 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151657, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151657 BINDING SITE, designated SEQ ID:8780, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24531] Another function of GAM146 is therefore inhibition of LOC151657 (Accession XM_098100.6) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151657.

[24532] LOC152845 (Accession XM_016366.2) is another GAM146 target gene, herein designated TARGET GENE. LOC152845 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152845, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC152845 BINDING SITE, designated SEQ ID:2714, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24533] Another function of GAM146 is therefore inhibition of LOC152845 (Accession XM_016366.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152845.

[24534] LOC157507 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC157507 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:17300, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24535] Another function of GAM146 is therefore inhibition of LOC157507 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157507.

[24536] LOC158056 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC158056 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:10700, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24537] Another function of GAM146 is therefore inhibition of LOC158056 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056.

[24538] LOC158295 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC158295 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158295, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC158295 BINDING SITE, designated SEQ ID:5627, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24539] Another function of GAM146 is therefore inhibition of LOC158295 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158295.

[24540] LOC166206 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC166206 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC166206, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC166206 BINDING SITE, designated SEQ ID:4968, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24541] Another function of GAM146 is therefore inhibition of LOC166206 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166206.

[24542] LOC196047 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC196047 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196047 BINDING SITE, designated SEQ ID:10514, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24543] Another function of GAM146 is therefore inhibition of LOC196047 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196047.

[24544] LOC204084 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC204084 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC204084, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC204084 BINDING SITE, designated SEQ ID:15967, to

the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24545] Another function of GAM146 is therefore inhibition of LOC204084 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204084.

[24546] LOC204275 (Accession XM_115290.3) is another GAM146 target gene, herein designated TARGET GENE. LOC204275 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC204275, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC204275 BINDING SITE, designated SEQ ID:2816, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24547] Another function of GAM146 is therefore inhibition of LOC204275 (Accession XM_115290.3) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204275.

[24548] LOC221486 (Accession) is another GAM146 target gene,

herein designated TARGET GENE. LOC221486 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:10719, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24549] Another function of GAM146 is therefore inhibition of LOC221486 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221486.

[24550] LOC254808 (Accession XM_173100.1) is another GAM146 target gene, herein designated TARGET GENE. LOC254808 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254808, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254808 BINDING SITE, designated SEQ ID:19184, to the nucleotide sequence of GAM146 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:370.

[24551] Another function of GAM146 is therefore inhibition of LOC254808 (Accession XM_173100.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254808.

[24552] LOC257109 (Accession) is another GAM146 target gene, herein designated TARGET GENE. LOC257109 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257109, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257109 BINDING SITE, designated SEQ ID:7095, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24553] Another function of GAM146 is therefore inhibition of LOC257109 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257109.

[24554] LOC257235 (Accession XM_173124.1) is another GAM146 target gene, herein designated TARGET GENE. LOC257235

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257235 BINDING SITE, designated SEQ ID:1513, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24555] Another function of GAM146 is therefore inhibition of LOC257235 (Accession XM_173124.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257235.

[24556] LOC90701 (Accession NM_033280.1) is another GAM146 target gene, herein designated TARGET GENE. LOC90701 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90701, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90701 BINDING SITE, designated SEQ ID:17610, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24557] Another function of GAM146 is therefore inhibition of LOC90701 (Accession NM_033280.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90701.

[24558] LOC92249 (Accession XM_043814.2) is another GAM146 target gene, herein designated TARGET GENE. LOC92249 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92249, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:19858, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24559] Another function of GAM146 is therefore inhibition of LOC92249 (Accession XM_043814.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249.

[24560] MGC10500 (Accession NM_031477.2) is another GAM146 target gene, herein designated TARGET GENE. MGC10500 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC10500, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10500 BINDING SITE, designated SEQ ID:17215, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24561] Another function of GAM146 is therefore inhibition of MGC10500 (Accession NM_031477.2) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10500.

[24562] moblak (Accession NM_130807.1) is another GAM146 target gene, herein designated TARGET GENE. moblak BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:11256, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24563] Another function of GAM146 is therefore inhibition of

moblak (Accession NM_130807.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak.

[24564] Npc1 (niemann-pick disease, type c1, gene)-like 1 (NPC1L1, Accession NM_013389.1) is another GAM146 target gene, herein designated TARGET GENE. NPC1L1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPC1L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPC1L1 BINDING SITE, designated SEQ ID:13102, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24565] Another function of GAM146 is therefore inhibition of Npc1 (niemann-pick disease, type c1, gene)-like 1 (NPC1L1, Accession NM_013389.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPC1L1.

[24566] Protein disulfide isomerase, pancreatic (PDIP, Accession NM_006849.1) is another GAM146 target gene, herein

designated TARGET GENE. PDIP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDIP BINDING SITE, designated SEQ ID:13937, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24567] Another function of GAM146 is therefore inhibition of Protein disulfide isomerase, pancreatic (PDIP, Accession NM_006849.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDIP.

[24568] Pdz domain containing 2 (PDZD2, Accession) is another GAM146 target gene, herein designated TARGET GENE. PDZD2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PDZD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:18141, to the nucleotide sequence of GAM146 RNA, herein designated

GAM RNA, also designated SEQ ID:370.

[24569] Another function of GAM146 is therefore inhibition of Pdz domain containing 2 (PDZD2, Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2.

[24570] Pleiomorphic adenoma gene 1 (PLAG1, Accession NM_002655.1) is another GAM146 target gene, herein designated TARGET GENE. PLAG1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PLAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:18558, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24571] Another function of GAM146 is therefore inhibition of Pleiomorphic adenoma gene 1 (PLAG1, Accession NM_002655.1), a gene which contains a zinc finger domain. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1.

[24572] The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Protein phosphatase 1, regulatory (inhibitor) subunit 13b (PPP1R13B, Accession NM_015316.1) is another GAM146 target gene, herein designated TARGET GENE. PPP1R13B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R13B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R13B BINDING SITE, designated SEQ ID:4491, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24573] Another function of GAM146 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 13b (PPP1R13B, Accession NM_015316.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R13B.

[24574] Regulator of g-protein signalling 3 (RGS3, Accession NM_144488.1) is another GAM146 target gene, herein designated TARGET GENE. RGS3 BINDING SITE is a target

binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RGS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGS3 BINDING SITE, designated SEQ ID:18411, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24575] Another function of GAM146 is therefore inhibition of Regulator of g-protein signalling 3 (RGS3, Accession NM_144488.1), a gene which negatively regulates G protein- coupled receptor signalling. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS3.

[24576] The function of RGS3 has been established by previous studies. Chatterjee et al. (1997) stated that 17 mammalian RGS members had been identified by cloning or by comparison to expressed sequence tags (ESTs). They studied RGS3, the largest member of the RGS family to date. They found that the coding region of the human RGS3 gene spans 14.7 kb and contains 6 exons; the 5- prime untranslated region spans 3.2 kb and contains 2 exons. The RGS domain, conserved among all RGS proteins, is en-

coded by 3 exons, while the unique N- terminal domain of RGS3 is encoded by a single exon. Comparison of the locations of the intron- exon boundaries of the human RGS3 gene to those of the human RGS2 gene revealed a remarkable similarity. Using 5- prime- RACE analysis, they mapped the transcription start site 517 bp upstream of the translation start site. Many potential regulatory elements were identified in the 5- prime flanking region. By screening a mouse embryonic cDNA library using the yeast 2- hybrid system with the cytoplasmic domain of ephrin- B2 (EFNB2; 600527) as bait, Lu et al. (2001) isolated cDNAs encoding a cytoplasmic protein they designated Pdz- Rgs3. Pdz- Rgs3 binds ephrin- B2 through a PDZ domain, and it has an RGS domain. The human homolog of Pdz- Rgs3, RGS3, had been described as a shorter sequence (Druey et al., 1996). Pdz- Rgs3 can mediate signaling from the ephrin- B cytoplasmic tail. The authors showed that SDF1 (OMIM Ref. No. 600835), a chemokine with a G protein- coupled receptor, and BDNF (OMIM Ref. No. 113505) are chemoattractants for cerebellar granule cells, and that SDF1 chemoattraction is selectively inhibited by soluble ephrin- B receptor (see OMIM Ref. No. 602757). This inhibition could be blocked by a

truncated Pdz- Rgs3 protein lacking the RGS domain.

[24577]

[24578] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24579] Druey, K. M.; Blumer, K. J.; Kang, V. H.; Kehrl, J. H. : Inhibition of G- protein- mediated MAP kinase activation by a new mammalian gene family. Nature 379: 742- 746, 1996. ; and

[24580] Chatterjee, T. K.; Eapen, A.; Kanis, A. B.; Fisher, R. A. : Genomic organization, 5- prime- flanking region, and chromosomal localization of the human RGS3 gene. Genomics 45: 429- 433, 1997.

[24581] Further studies establishing the function and utilities of RGS3 are found in John Hopkins OMIM database record ID 602189, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ring finger protein 2 (RNF2, Accession NM_007212.1) is another GAM146 target gene, herein designated TARGET GENE. RNF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of RNF2 BINDING SITE, designated SEQ ID:16379, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24582] Another function of GAM146 is therefore inhibition of Ring finger protein 2 (RNF2, Accession NM_007212.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF2.

[24583] Retinoid x receptor, alpha (RXRA, Accession NM_002957.3) is another GAM146 target gene, herein designated TARGET GENE. RXRA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RXRA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:11770, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24584] Another function of GAM146 is therefore inhibition of Retinoid x receptor, alpha (RXRA, Accession NM_002957.3), a gene which activates genes required for

vitamin A metabolism, binds 9- cis retinoic acid. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRA.

[24585] The function of RXRA has been established by previous studies. Retinoic acid has been implicated in many aspects of vertebrate development and homeostasis. Its effects are mediated by specific nuclear receptor proteins that are members of the steroid and thyroid hormone receptor superfamily of transcriptional regulators. In addition to the high affinity retinoic acid receptors termed alpha (RARA; 180240), beta (RARB; 180220), and gamma (RARG; 180190), Mangelsdorf et al. (1990, 1991) identified a distinct nuclear receptor referred to as retinoid X receptor alpha. This receptor differs from the other 3 RARs within the ligand- binding domain and is incapable of high affinity binding of retinoic acid itself. The retinoic acid, thyroid hormone, and vitamin D receptors, as well as the retinoid X receptor, activate transcription from response elements containing 2 or more degenerate copies of the consensus motif AGGTCA. Heyman et al. (1992) presented evidence that 9- cis retinoic acid is a high affinity ligand for RXRA. McNamara et al. (2001) reported a hormone- dependent

interaction of the nuclear receptors RARA and RXRA with CLOCK (OMIM Ref. No. 601851) and MOP4 (OMIM Ref. No. 603347). They found that these interactions negatively regulate CLOCK- BMAL1 (OMIM Ref. No. 602550) and MOP4- BMAL1 heterodimer- mediated transcriptional activation of clock gene expression in vascular cells. MOP4 exhibited a robust rhythm in the vasculature, and retinoic acid could phase shift PER2 (OMIM Ref. No. 603426) mRNA rhythmicity in vivo and in serum- induced smooth muscle cells in vitro, providing a molecular mechanism for hormonal control of clock gene expression. McNamara et al. (2001) proposed that circadian or periodic availability of nuclear hormones may play a critical role in resetting a peripheral vascular clock. Using RFLVs in interspecific backcross mice, Hoopes et al. (1992) mapped mouse genomic loci Rxra, Rxrb, and Rxrg to chromosome 2 near the centromere, to the H- 2 region of chromosome 17, and to distal chromosome 1 in tight linkage with the Pbx (OMIM Ref. No. 176310) gene, respectively. Jones et al. (1993) mapped the RXRA gene to chromosome 9 by using PCR on a panel of somatic cell hybrids. A cosmid clone was isolated using the RXRA PCR product, and this was used to localize the gene further by fluorescence in situ

hybridization to 9q34, distal to the dopamine beta- hydroxylase gene (DBH; 223360). The mapping position was confirmed by PCR on a panel of translocation hybrids. By pairwise hybridization of an RXRA cosmid and reference markers in fluorescence in situ hybridization, Almasan et al. (1994) refined the localization to 9q34.3. Fusion of PML (OMIM Ref. No. 102578) and TIF1A (OMIM Ref. No. 603406) to RARA and BRAF (OMIM Ref. No. 164757), respectively, results in the production of PML- RAR- alpha and TIF1- alpha- B- RAF (T18) oncoproteins. Zhong et al. (1999) showed that PML, TIF1- alpha, and RXR- alpha/RAR- alpha function together in a retinoic acid- dependent transcription complex. Zhong et al. (1999) found that PML acts as a ligand- dependent coactivator of RXR- alpha/RARA- alpha. T18, similar to PML- RAR- alpha, disrupts the retinoic acid- dependent activity of this complex in a dominant- negative manner, resulting in a growth advantage. PML- RAR- alpha was the first example of an oncoprotein generated by the fusion of 2 molecules participating in the same pathway, specifically the fusion of a transcription factor to one of its own cofactors. Since the PML and RAR- alpha pathways converge at the transcriptional level, there is no need for a double- dominant-

negative product to explain the pathogenesis of acute promyelocytic leukemia, or APL. Germain et al. (2002) showed that RXR can bind ligand and recruit coactivators as a heterodimer with apo- retinoic acid receptor (apo-RAR). However, in the usual cellular environment core-pressors do not dissociate and they prohibit coactivator access because coregulator binding is mutually exclusive

[24586] Animal model experiments lend further support to the function of RXRA. Li et al. (2000) developed an efficient technique to create spatiotemporally controlled somatic mutations of the Rxr- alpha gene in the mouse. Li et al. (2000) used tamoxifen- inducible Cre- ER(T) recombinases to ablate RXR- alpha selectively in adult mouse keratinocytes. In 6 to 7 weeks after the first tamoxifen treatment, alopecia developed in the ventral region of pro-mutant mice. At 12 to 16 weeks after treatment, large regions of ventral skin and smaller regions of dorsal skin were hairless. Cysts became visible under the skin surface and these enlarged and spread all over the body with time. At 16 weeks after treatment, hairless regions showed hair follicle degeneration, resulting in utriculi and dermal cysts. Keratin 6 (OMIM Ref. No. 148041), which is usually expressed only in hair follicle outer root sheath,

was also expressed in hyperproliferative interfollicular epidermis, indicating abnormal keratinocyte terminal differentiation. All abnormalities were less severe, and/or appeared later, in males than in females. Li et al. (2000) found that RXR- beta (OMIM Ref. No. 180246) expression in adult skin is several- fold higher in males than in females. Study of tamoxifen- treated RXR- alpha/RXR- beta compound mutants demonstrated that RXR- beta can partially compensate for a loss of RXR- alpha function. Also, in accordance with a larger amount of RXR- beta in adult male skin, the functional redundancy was more pronounced in males than in females, as RXR- alpha/beta double mutant males and females were similarly affected, unlike the single mutants. De Urquiza et al. (2000) identified docosahexaenoic acid (DHA), a long- chain polyunsaturated fatty acid that is highly enriched in the adult mammalian brain, as the natural ligand for the retinoic X receptor in mouse brain. Claudel et al. (2001) analyzed the effects of activation of RXR and some of its heterodimers in apolipoprotein E - /- mice, a well- established animal model of atherosclerosis. An RXR agonist drastically reduced the development of atherosclerosis. In addition, a ligand for the peroxisome proliferator- acti-

vated receptor PPAR- gamma and a dual agonist of both PPAR- alpha and PPAR- gamma had moderate inhibitory effects. Both RXR and LXR agonists induced ATP- binding cassette protein- 1 (ABC1) expression and stimulated ABC1- mediated cholesterol efflux from macrophages from wildtype, but not from LXRA or LXRB (OMIM Ref. No. 600380), double - /- mice. Hence, activation of ABC1-mediated cholesterol efflux by the RXR/LXR heterodimer may contribute to the beneficial effects of rexinoids on atherosclerosis and warrant further evaluation of RXR/LXR agonists in prevention and treatment of atherosclerosis.

[24587] It is appreciated that the abovementioned animal model for RXRA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24588] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24589] Claudel, T.; Leibowitz, M. D.; Fievet, C.; Tailleux, A.; Wagner, B.; Repa, J. J.; Torpier, G.; Lobaccaro, J.- M.; Paterniti, J. R.; Mangelsdorf, D. J.; Heyman, R. A.; Auwerx, J. : Reduction of atherosclerosis in apolipoprotein E knockout mice by activation of the retinoid X receptor. Proc. Nat.

Acad. Sci. 98: 2610- 2615, 2001. ; and

[24590] Germain, P.; Iyer, J.; Zechel, C.; Gronemeyer, H. : Co- regulator recruitment and the mechanism of retinoic acid receptor synergy. Nature 415: 187- 192, 2002.

[24591] Further studies establishing the function and utilities of RXRA are found in John Hopkins OMIM database record ID 180245, and in cited publications listed in Table 5, which are hereby incorporated by reference.SCYA28 (Accession) is another GAM146 target gene, herein designated TARGET GENE. SCYA28 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCYA28, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCYA28 BINDING SITE, designated SEQ ID:3241, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24592] Another function of GAM146 is therefore inhibition of SCYA28 (Accession) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA28.

[24593] Solute carrier family 39 (zinc transporter), member 4 (SLC39A4, Accession NM_130849.1) is another GAM146

target gene, herein designated TARGET GENE. SLC39A4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SLC39A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC39A4 BINDING SITE, designated SEQ ID:13352, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24594] Another function of GAM146 is therefore inhibition of Solute carrier family 39 (zinc transporter), member 4 (SLC39A4, Accession NM_130849.1), a gene which is a zinc transporter and therefore may be associated with Acrodermatitis enteropathica. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of Acrodermatitis enteropathica, and of other diseases and clinical conditions associated with SLC39A4.

[24595] The function of SLC39A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Smcx homolog, x chromosome (mouse) (SMCX, Accession NM_004187.1) is another GAM146 tar-

get gene, herein designated TARGET GENE. SMCX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMCX BINDING SITE, designated SEQ ID:17633, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24596] Another function of GAM146 is therefore inhibition of Smcx homolog, x chromosome (mouse) (SMCX, Accession NM_004187.1), a gene which escapes X inactivation. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCX.

[24597] The function of SMCX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Spermidine synthase (SRM, Accession NM_003132.1) is another GAM146 target gene, herein designated TARGET GENE. SRM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRM, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRM BINDING SITE, designated SEQ ID:14242, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24598] Another function of GAM146 is therefore inhibition of Spermidine synthase (SRM, Accession NM_003132.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRM.

[24599] TCF-3 (Accession) is another GAM146 target gene, herein designated TARGET GENE. TCF-3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCF-3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCF-3 BINDING SITE, designated SEQ ID:16528, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24600] Another function of GAM146 is therefore inhibition of TCF-3 (Accession) . Accordingly, utilities of GAM146 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF-3.

[24601] Transmembrane protease, serine 3 (TMPRSS3, Accession NM_024022.1) is another GAM146 target gene, herein designated TARGET GENE. TMPRSS3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TMPRSS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMPRSS3 BINDING SITE, designated SEQ ID:11876, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24602] Another function of GAM146 is therefore inhibition of Transmembrane protease, serine 3 (TMPRSS3, Accession NM_024022.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMPRSS3.

[24603] Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1) is another GAM146 target gene, herein designated TARGET GENE. WHSC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WHSC1, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:12138, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24604] Another function of GAM146 is therefore inhibition of Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1), a gene which binds covalently to and repairs g/t mismatches. and therefore may be associated with Wolf- hirschhorn syndrome. Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of Wolf- hirschhorn syndrome, and of other diseases and clinical conditions associated with WHSC1.

[24605] The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Z39IG (Accession NM_007268.1) is another GAM146 target gene, herein designated TARGET GENE. Z39IG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Z39IG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of Z39IG BINDING SITE, designated SEQ ID:10116, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24606] Another function of GAM146 is therefore inhibition of Z39IG (Accession NM_007268.1) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Z39IG.

[24607] Zinc finger protein 17 (hpf3, kox 10) (ZNF17, Accession XM_091895.5) is another GAM146 target gene, herein designated TARGET GENE. ZNF17 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF17 BINDING SITE, designated SEQ ID:12073, to the nucleotide sequence of GAM146 RNA, herein designated GAM RNA, also designated SEQ ID:370.

[24608] Another function of GAM146 is therefore inhibition of Zinc finger protein 17 (hpf3, kox 10) (ZNF17, Accession XM_091895.5) . Accordingly, utilities of GAM146 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ZNF17.

[24609]

[24610] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 147 (GAM147), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24611] GAM147 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM147 was detected is described hereinabove with reference to Figs. 8-15.

[24612] GAM147 gene, herein designated GAM GENE, and GAM147 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[24613] GAM147 gene encodes a GAM147 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM147 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM147 precursor RNA is designated SEQ ID:196, and is provided hereinbelow with reference to the sequence listing part.

[24614] GAM147 precursor RNA folds onto itself, forming GAM147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24615] GAM147 precursor RNA folds onto itself, forming GAM147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[24616] Nucleotide sequence of GAM147 precursor RNA, designated SEQ-ID: 196, and a schematic representation of a predicted secondary folding of GAM147 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[24617] An enzyme complex designated DICER COMPLEX, `dices` the GAM147 folded precursor RNA into GAM147 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM147 RNA is designated SEQ ID:298, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[24618] GAM147 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM147 target RNA, herein designated GAM TARGET RNA. GAM147 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24619] GAM147 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM147 target RNA, herein designated GAM TARGET RNA. This complementary binding is

due to the fact that the nucleotide sequence of GAM147 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM147 RNA may have a different number of target binding sites in untranslated regions of a GAM147 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24620] The complementary binding of GAM147 RNA, herein designated GAM RNA, to target binding sites on GAM147 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM147 target RNA into GAM147 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24621] It is appreciated that GAM147 target gene, herein desig-

nated TARGET GENE, in fact represents a plurality of GAM147 target genes. The mRNA of each one of this plurality of GAM147 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM147 RNA, herein designated GAM RNA, and which when bound by GAM147 RNA causes inhibition of translation of respective one or more GAM147 target proteins.

[24622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM147 gene, herein designated GAM GENE, on one or more GAM147 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a

tiny RNA world, Science 294,779 (2001)).

[24623] It is appreciated that specific functions and accordingly utilities of GAM147 correlate with, and may be deduced from, the identity of the target genes which GAM147 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24624]

[24625]

[24626] FLJ21276 (Accession) is a GAM147 target gene, herein designated TARGET GENE. FLJ21276 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:532, to the nucleotide sequence of GAM147 RNA, herein designated GAM RNA, also designated SEQ ID:298.

[24627] A function of GAM147 is therefore inhibition of FLJ21276 (Accession) . Accordingly, utilities of GAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276.

[24628] Forkhead box e1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473.3) is another GAM147 target gene, herein designated TARGET GENE. FOXE1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOXE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXE1 BINDING SITE, designated SEQ ID:9989, to the nucleotide sequence of GAM147 RNA, herein designated GAM RNA, also designated SEQ ID:298.

[24629] Another function of GAM147 is therefore inhibition of Forkhead box e1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473.3) . Accordingly, utilities of GAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE1.

[24630] Protein kinase (camp-dependent, catalytic) inhibitor gamma (PKIG, Accession NM_007066.2) is another GAM147 target gene, herein designated TARGET GENE. PKIG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKIG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of PKIG BINDING SITE, designated SEQ ID:15790, to the nucleotide sequence of GAM147 RNA, herein designated GAM RNA, also designated SEQ ID:298.

[24631] Another function of GAM147 is therefore inhibition of Protein kinase (camp-dependent, catalytic) inhibitor gamma (PKIG, Accession NM_007066.2) . Accordingly, utilities of GAM147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIG.

[24632]

[24633] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 148 (GAM148), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24634] GAM148 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM148 was detected is described hereinabove with reference to Figs. 8-15.

[24635] GAM148 gene, herein designated GAM GENE, and GAM148 target gene, herein designated TARGET GENE,

are human genes contained in the human genome.

[24636] GAM148 gene encodes a GAM148 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM148 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM148 precursor RNA is designated SEQ ID:65, and is provided hereinbelow with reference to the sequence listing part.

[24637] GAM148 precursor RNA folds onto itself, forming GAM148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24638] GAM148 precursor RNA folds onto itself, forming GAM148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[24639] Nucleotide sequence of GAM148 precursor RNA, designated SEQ-ID: 65, and a schematic representation of a predicted secondary folding of GAM148 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[24640] An enzyme complex designated DICER COMPLEX, `dices` the GAM148 folded precursor RNA into GAM148 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM148 RNA is designated SEQ ID:280, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[24641] GAM148 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM148 target

RNA, herein designated GAM TARGET RNA. GAM148 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24642] GAM148 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM148 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM148 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM148 RNA may have a different number of target binding sites in untranslated regions of a GAM148 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[24643] The complementary binding of GAM148 RNA, herein designated GAM RNA, to target binding sites on GAM148 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM148 target RNA into GAM148 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24644] It is appreciated that GAM148 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM148 target genes. The mRNA of each one of this plurality of GAM148 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM148 RNA, herein designated GAM RNA, and which when bound by GAM148 RNA causes inhibition of translation of respective one or more GAM148 target proteins.

[24645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM148 gene, herein designated GAM GENE, on one or more GAM148 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes.

As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24646] It is appreciated that specific functions and accordingly utilities of GAM148 correlate with, and may be deduced from, the identity of the target genes which GAM148 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24647]

[24648]

[24649] Adenosine a1 receptor (ADORA1, Accession NP_000665.1) is a GAM148 target gene, herein designated TARGET GENE. ADORA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADORA1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADORA1 BINDING SITE, designated SEQ ID:3384, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24650] A function of GAM148 is therefore inhibition of Adenosine a1 receptor (ADORA1, Accession NP_000665.1), a gene which the activity of this receptor is mediated by g proteins which inhibit adenylyl cyclase. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADORA1.

[24651] The function of ADORA1 has been established by previous studies. Diverse physiologic effects of adenosine were recognized as early as the 1920s (Drury and Szent- Gyorgyi, 1929; Berne, 1963). Once released, adenosine activates adenosine receptors, which in turn regulate a diverse set of physiologic functions including cardiac rate and contractility, smooth muscle tone, sedation, release of neurotransmitters, platelet function, lipolysis, renal function, and white blood cell function. Stiles (1992) reviewed the structure and function of adenosine receptors important in the mediation of these multiple effects. Also see

adenosine A2 receptor (ADORA2A; 102776). Libert et al. (1991) obtained cDNA clones for 4 receptors of the G protein- coupled receptor family by selective amplification of cloning from thyroid cDNA and termed them RDC1 (VIPR1; 192321), RDC4 (HTR1D; 182133), RDC7, and RDC8 (ADORA2A). RDC7 and RDC8 were identified as A1 and A2 adenosine receptors, respectively. By in situ hybridization, Libert et al. (1991) assigned the RDC7 gene to 22q11.2-q13.1. However, using fluorescence in situ hybridization, Townsend- Nicholson et al. (1995) demonstrated that the ADORA1 gene is located on 1q32.1.

[24652] Animal model experiments lend further support to the function of ADORA1. Sun et al. (2001) used homologous recombination to generate viable mice without gross behavioral or anatomic defects that were deficient in the 2-exon A1ar gene, which encodes a protein 87% identical to the human protein.

[24653] It is appreciated that the abovementioned animal model for ADORA1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24654] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[24655] Stiles, G. L. : Adenosine receptors. J. Biol. Chem. 267: 6451- 6454, 1992. ; and

[24656] Sun, D.; Samuelson, L. C.; Yang, T.; Huang, Y.; Paliege, A.; Saunders, T.; Briggs, J.; Schnermann, J. : Mediation of tubuloglomerular feedback by adenosine: evidence from mice lacking ad.

[24657] Further studies establishing the function and utilities of ADORA1 are found in John Hopkins OMIM database record ID 102775, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adrenergic, alpha-1a-, receptor (ADRA1A, Accession NP_000671.1) is another GAM148 target gene, herein designated TARGET GENE. ADRA1A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADRA1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADRA1A BINDING SITE, designated SEQ ID:1241, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24658] Another function of GAM148 is therefore inhibition of

Adrenergic, alpha-1a-, receptor (ADRA1A, Accession NP_000671.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRA1A.

[24659] Aldehyde dehydrogenase 9 family, member a1 (ALDH9A1, Accession NP_000687.2) is another GAM148 target gene, herein designated TARGET GENE. ALDH9A1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ALDH9A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALDH9A1 BINDING SITE, designated SEQ ID:5663, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24660] Another function of GAM148 is therefore inhibition of Aldehyde dehydrogenase 9 family, member a1 (ALDH9A1, Accession NP_000687.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH9A1.

[24661] Amine oxidase, copper containing 3 (vascular adhesion protein 1) (AOC3, Accession NP_003725.1) is another GAM148 target gene, herein designated TARGET GENE.

AOC3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AOC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AOC3 BINDING SITE, designated SEQ ID:10641, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24662] Another function of GAM148 is therefore inhibition of Amine oxidase, copper containing 3 (vascular adhesion protein 1) (AOC3, Accession NP_003725.1), a gene which catalyze the oxidative conversion of amines to aldehydes in the presence of copper and quinone cofactor. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOC3.

[24663] The function of AOC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Amyloid beta (a4) precursor protein-binding, family a, member 1 (x11) (APBA1, Accession NP_001154.2) is another GAM148 target gene, herein designated TARGET GENE. APBA1 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by APBA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APBA1 BINDING SITE, designated SEQ ID:6310, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24664] Another function of GAM148 is therefore inhibition of Amyloid beta (a4) precursor protein-binding, family a, member 1 (x11) (APBA1, Accession NP_001154.2), a gene which stabilises APP and inhibits production of proteolytic APP fragments. and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with APBA1.

[24665] The function of APBA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.2.Arylsulfatase a (ARSA, Accession NP_000478.2) is another GAM148 target gene, herein designated TARGET GENE. ARSA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA

encoded by ARSA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARSA BINDING SITE, designated SEQ ID:10346, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24666] Another function of GAM148 is therefore inhibition of Arylsulfatase a (ARSA, Accession NP_000478.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARSA.

[24667] Chromosome 10 open reading frame 3 (C10orf3, Accession NP_060601.2) is another GAM148 target gene, herein designated TARGET GENE. C10orf3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C10orf3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C10orf3 BINDING SITE, designated SEQ ID:10591, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24668] Another function of GAM148 is therefore inhibition of Chromosome 10 open reading frame 3 (C10orf3, Accession NP_060601.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C10orf3.

[24669] Chromosome 11 open reading frame 21 (C11orf21, Accession NP_054863.1) is another GAM148 target gene, herein designated TARGET GENE. C11orf21 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C11orf21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C11orf21 BINDING SITE, designated SEQ ID:13424, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24670] Another function of GAM148 is therefore inhibition of Chromosome 11 open reading frame 21 (C11orf21, Accession NP_054863.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf21.

[24671] Chromosome 20 open reading frame 54 (C20orf54, Accession NP_212134.1) is another GAM148 target gene,

herein designated TARGET GENE. C20orf54 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf54, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf54 BINDING SITE, designated SEQ ID:12151, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24672] Another function of GAM148 is therefore inhibition of Chromosome 20 open reading frame 54 (C20orf54, Accession NP_212134.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf54.

[24673] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_057432.1) is another GAM148 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C5orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:19712, to the

nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24674] Another function of GAM148 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_057432.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[24675] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) is another GAM148 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C5orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:19712, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24676] Another function of GAM148 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[24677] Cadherin 16, ksp-cadherin (CDH16, Accession NP_004053.1) is another GAM148 target gene, herein designated TARGET GENE. CDH16 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CDH16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH16 BINDING SITE, designated SEQ ID:10351, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24678] Another function of GAM148 is therefore inhibition of Cadherin 16, ksp-cadherin (CDH16, Accession NP_004053.1), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH16.

[24679] The function of CDH16 has been established by previous studies. Cadherins are calcium- dependent, membrane-associated glycoproteins. Members of this group are the principal mediators of homotypic cellular recognition and play a role in the morphogenic direction of tissue development. Thomson et al. (1995) identified rabbit Ksp- cad-

herin, a novel kidney- specific member of the cadherin family. Sequence analysis demonstrated that Ksp- cadherin, like LI- cadherin (CDH17; 603017), lacks the prosequence and tripeptide HAV adhesion recognition sequence typical of most classical cadherins, and possesses a truncated cytoplasmic domain. Northern blot analysis and immunolocalization studies in rabbit indicate that Ksp- cadherin expression is kidney- specific and limited to the basolateral membranes of renal tubular epithelial cells. By screening kidney libraries with rabbit Ksp- cadherin cDNAs, Thomson et al. (1998) isolated cDNAs encoding mouse and human Ksp- cadherin. The predicted 829- amino acid human protein shares 77% and 79% sequence identity with those of mouse and rabbit, respectively. Northern blot analysis revealed that Ksp- cadherin is expressed exclusively in kidney as a 3- kb mRNA in both human and mouse. By fluorescence in situ hybridization, Thomson et al. (1998) mapped the Ksp- cadherin gene to human chromosome 16q21- q22. By analysis of an interspecific backcross, they mapped the mouse homolog to a region of mouse chromosome 8 showing homology of synteny to 16q21- proximal 16q22. In both human and mouse, the Ksp- cadherin gene is located within a cluster

of several other cadherin genes, including CDH1 (OMIM Ref. No. 192090), CDH3 (OMIM Ref. No. 114021), CDH5 (OMIM Ref. No. 601120), and CDH15 (OMIM Ref. No. 114019).

[24680]

[24681] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24682] Thomson, R. B.; Igarashi, P.; Biemesderfer, D.; Kim, R.; Abu- Alfa, A.; Soleimani, M.; Aronson, P. S. : Isolation and cDNA cloning of Ksp- cadherin, a novel kidney- specific member of the cadherin multigene family. J. Biol. Chem. 270: 17594- 17601, 1995. ; and

[24683] Thomson, R. B.; Ward, D. C.; Quaggin, S. E.; Igarashi, P.; Muckler, Z. E.; Aronson, P. S. : cDNA cloning and chromo- somal localization of the human and mouse isoforms of Ksp- cadherin. Ge.

[24684] Further studies establishing the function and utilities of CDH16 are found in John Hopkins OMIM database record ID 603118, and in cited publications listed in Table 5, which are hereby incorporated by reference.Choline ki- nase-like (CHKL, Accession NP_689466.1) is another GAM148 target gene, herein designated TARGET GENE.

CHKL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CHKL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHKL BINDING SITE, designated SEQ ID:18892, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24685] Another function of GAM148 is therefore inhibition of Choline kinase-like (CHKL, Accession NP_689466.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHKL.

[24686] Carbohydrate (chondroitin) synthase 1 (CHSY1, Accession NP_055733.2) is another GAM148 target gene, herein designated TARGET GENE. CHSY1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHSY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHSY1 BINDING SITE, designated SEQ ID:9095, to the nucleotide sequence of GAM148 RNA,

herein designated GAM RNA, also designated SEQ ID:280.

[24687] Another function of GAM148 is therefore inhibition of Carbohydrate (chondroitin) synthase 1 (CHSY1, Accession NP_055733.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHSY1.

[24688] Ciliary neurotrophic factor (CNTF, Accession NP_000605.1) is another GAM148 target gene, herein designated TARGET GENE. CNTF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNTF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNTF BINDING SITE, designated SEQ ID:15418, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24689] Another function of GAM148 is therefore inhibition of Ciliary neurotrophic factor (CNTF, Accession NP_000605.1), a gene which is a survival factor for various neuronal cell types. and therefore may be associated with Ciliary neurotrophic factor polymorphism. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of

Ciliary neurotrophic factor polymorphism, and of other diseases and clinical conditions associated with CNTF.

[24690] The function of CNTF has been established by previous studies. Takahashi et al. (1994) identified an apparent polymorphism of the CNTF gene. An acceptor splice site mutation caused aberrant mRNA splicing and abolished expression of CNTF protein. The specific change was a G-to- A transition at position - 6 of the acceptor splice site leading to insertion of 4 additional ribonucleotides at the beginning of the next exon. This caused a frameshift from amino acid 39, resulting in a stop codon 24 amino acids downstream. (The normal open reading frame codes for 200 amino acids.) The aberrant mRNA was predicted to code for a truncated protein of 62 amino acids. Analysis of tissue samples and transfection of CNTF minigenes into cultured cells demonstrated to Takahashi et al. (1994) that the mutated allele expressed only the mutated mRNA species. Studies with an antiserum that recognized both the normal and mutated CNTF showed complete lack of CNTF immunoreactivity in peripheral nerve tissue from a homozygous mutant subject. In 391 Japanese people tested, 61.9% were normal homozygotes, 39.8% heterozygotes, and 2.3% mutant homozygotes. The distribution of

the 3 genotypes were similar in healthy and neurologic disease subjects, indicating that human CNTF deficiency is not causally related to neurologic diseases In 7 of 288 patients with multiple sclerosis (OMIM Ref. No. 126200), Giess et al. (2002) identified homozygosity for the CNTF null mutation. The 7 patients demonstrated a significantly earlier age of onset of disease (17 years) compared to patients carrying at least 1 functional CNTF allele (27 years). Six of the 7 patients with the null allele (85%) had marked motor or brainstem symptoms and incomplete remission, which was detected in only 21% of the other patients with MS. Giess et al. (2002) noted that the null allele is very rare, and that the frequency of the homozygous null allele in this group is the same as in control groups, thus indicating that the genotype itself is not a risk factor for development of MS. However, they suggested that trophic support of neurons and oligodendrocytes by CNTF may be critical to reduce early damage caused by inflammatory mediators, and that lack of functional CNTF may lead to earlier onset of clinical symptoms in MS

[24691]

[24692] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[24693] Barbin, G.; Manthorpe, M.; Varon, S. : Purification of the chick eye ciliary neuronotrophic factor. J. Neurochem. 43: 1468- 1478, 1984. ; and

[24694] Takahashi, R.; Yokoji, H.; Misawa, H.; Hayashi, M.; Hu, J.; Deguchi, T. : A null mutation in the human CNTF gene is not causally related to neurological diseases. Nature Genet. 7: 79- 84.

[24695] Further studies establishing the function and utilities of CNTF are found in John Hopkins OMIM database record ID 118945, and in cited publications listed in Table 5, which are hereby incorporated by reference.Contactin 3 (plasmacytoma associated) (CNTN3, Accession XP_039627.7) is another GAM148 target gene, herein designated TARGET GENE. CNTN3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNTN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNTN3 BINDING SITE, designated SEQ ID:13470, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24696] Another function of GAM148 is therefore inhibition of Contactin 3 (plasmacytoma associated) (CNTN3, Accession XP_039627.7), a gene which may play a role in the initial growth and guidance of axons. and therefore may be associated with Plasmacytomas. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of Plasmacytomas, and of other diseases and clinical conditions associated with CNTN3.

[24697] The function of CNTN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.2.Carboxypeptidase a4 (CPA4, Accession NP_057436.1) is another GAM148 target gene, herein designated TARGET GENE. CPA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPA4 BINDING SITE, designated SEQ ID:869, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24698] Another function of GAM148 is therefore inhibition of Carboxypeptidase a4 (CPA4, Accession NP_057436.1) .

Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPA4.

[24699] Carboxypeptidase a6 (CPA6, Accession NP_065094.2) is another GAM148 target gene, herein designated TARGET GENE. CPA6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CPA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPA6 BINDING SITE, designated SEQ ID:5035, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24700] Another function of GAM148 is therefore inhibition of Carboxypeptidase a6 (CPA6, Accession NP_065094.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPA6.

[24701] Deoxycytidine kinase (DCK, Accession NP_000779.1) is another GAM148 target gene, herein designated TARGET GENE. DCK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DCK, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCK BINDING SITE, designated SEQ ID:18281, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24702] Another function of GAM148 is therefore inhibition of Deoxycytidine kinase (DCK, Accession NP_000779.1), a gene which mediates the phosphorylation of several deoxyribonucleosides and their analogs. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCK.

[24703] The function of DCK has been established by previous studies. Deoxycytidine kinase (EC 2.7.1.74) is responsible for the phosphorylation of several deoxyribonucleosides and their analogs. Deficiency of this enzyme activity is associated with resistance to antiviral and anticancer chemotherapeutic agents, whereas increased enzyme activity is associated with increased activation of these compounds to cytotoxic nucleoside triphosphate derivatives. It is clinically important because of its relationship to drug resistance and sensitivity. It is the rate limiting enzyme in the activation of many important anticancer and retroviral drugs and its activity is often decreased in cells that are

resistant to cytosine arabinoside. Huang et al. (1989) cloned the DCK gene. Similarities to previously studied proteins such as the beta subunit of prolyl- 4- hydroxylase (OMIM Ref. No. 176790) were revealed. Chottiner et al. (1991) also cloned human deoxycytidine kinase from a T- lymphoblast DNA library. The cDNA sequence encoded a 30.5- kD protein corresponding to the subunit molecular mass of the purified protein. The authors of Huang et al. (1989) subsequently discovered that the sequence they had thought to represent DCK is in fact the human homolog of ERp72, the function of which is not yet known, and published a correction; the gene studied by Chottiner et al. (1991) is the true deoxycytidine kinase. Human deoxyribonucleoside kinases are required for the pharmacologic activity of several clinically important anticancer and antiviral nucleoside analogs. Human deoxycytidine kinase and thymidine kinase 1 (OMIM Ref. No. 188300) had been described as cytosolic enzymes, whereas human deoxyguanosine kinase (OMIM Ref. No. 601465) and thymidine kinase 2 (OMIM Ref. No. 188250) were believed to be located in the mitochondria. Johansson et al. (1997) expressed 4 human deoxyribonucleoside kinases as fusion proteins with the green fluorescent protein to study their

intracellular locations in vivo. They found that the human deoxycytidine kinase is located in the cell nucleus, and the human deoxyguanosine kinase in mitochondria. The fusion proteins between green fluorescent protein and thymidine kinases 1 and 2 were both predominantly located in the cytosol. Site- directed mutagenesis of a putative nuclear targeting signal, identified in the primary structure of deoxycytidine kinase, completely abolished nuclear import of the protein. Reconstitution of a deoxycytidine kinase- deficient cell line with the wildtype nuclear or the mutant cytosolic enzymes restored sensitivity toward anticancer nucleoside analogs.

[24704]

[24705] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24706] Chottiner, E. G.; Shewach, D. S.; Datta, N. S.; Ashcraft, E.; Gribbin, D.; Ginsburg, D.; Fox, I. H.; Mitchell, B. S. : Cloning and expression of human deoxycytidine kinase cDNA. Proc. Nat. Acad. Sci. 88: 1531- 1535, 1991. ; and

[24707] Johansson, M.; Brismar, S.; Karlsson, A. : Human deoxycytidine kinase is located in the cell nucleus. Proc. Nat. Acad. Sci. 94: 11941- 11945, 1997.

[24708] Further studies establishing the function and utilities of DCK are found in John Hopkins OMIM database record ID 125450, and in cited publications listed in Table 5, which are hereby incorporated by reference.DKFZp434E2321 (Accession XP_038298.1) is another GAM148 target gene, herein designated TARGET GENE. DKFZp434E2321 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434E2321, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434E2321 BINDING SITE, designated SEQ ID:15968, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24709] Another function of GAM148 is therefore inhibition of DKFZp434E2321 (Accession XP_038298.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2321.

[24710] DKFZp434H247 (Accession XP_290829.1) is another GAM148 target gene, herein designated TARGET GENE. DKFZp434H247 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

DKFZp434H247, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434H247 BINDING SITE, designated SEQ ID:13849, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24711] Another function of GAM148 is therefore inhibition of DKFZp434H247 (Accession XP_290829.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434H247.

[24712] DKFZP434P0111 (Accession XP_041116.1) is another GAM148 target gene, herein designated TARGET GENE. DKFZP434P0111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:7184, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24713] Another function of GAM148 is therefore inhibition of DKFZP434P0111 (Accession XP_041116.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111.

[24714] DKFZP434P0316 (Accession NP_115510.1) is another GAM148 target gene, herein designated TARGET GENE. DKFZP434P0316 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P0316 BINDING SITE, designated SEQ ID:5600, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24715] Another function of GAM148 is therefore inhibition of DKFZP434P0316 (Accession NP_115510.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0316.

[24716] DKFZP586M1523 (Accession NP_056291.1) is another GAM148 target gene, herein designated TARGET GENE.

DKFZP586M1523 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586M1523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586M1523 BINDING SITE, designated SEQ ID:7790, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24717] Another function of GAM148 is therefore inhibition of DKFZP586M1523 (Accession NP_056291.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1523.

[24718] Dopamine receptor d1 (DRD1, Accession NP_000785.1) is another GAM148 target gene, herein designated TARGET GENE. DRD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DRD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRD1 BINDING SITE, designated SEQ ID:2684, to the nucleotide sequence of GAM148 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:280.

[24719] Another function of GAM148 is therefore inhibition of Dopamine receptor d1 (DRD1, Accession NP_000785.1), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRD1.

[24720] The function of DRD1 has been established by previous studies. The diverse physiologic actions of dopamine are mediated by its interaction with 2 types of G protein-coupled receptor, D1 and D2 (OMIM Ref. No. 126450), which stimulate and inhibit, respectively, the enzyme adenylyl cyclase. Three groups reported the cloning of the D1 dopamine receptor gene (Dearry et al., 1990; Zhou et al., 1990; Sunahara et al., 1990). The gene encodes a protein of 446 amino acids having a predicted relative molecular mass of 49,300 and a transmembrane topology similar to that of other G protein- coupled receptors. Northern blot analysis and in situ hybridization showed that the mRNA for this receptor is most abundant in caudate, nucleus accumbens, and olfactory tubercle, with little or no mRNA detectable in substantia nigra, liver, kidney, or heart (Dearry et al., 1990).

[24721] Animal model experiments lend further support to the function of DRD1. The brain dopaminergic system is a critical modulator of basal ganglion function and plasticity. To investigate the contribution of the dopamine D1 receptor to this modulation, Xu et al. (1994) used gene targeting technology to generate D1 receptor mutant mice. Although histologic analyses suggested no major changes in the anatomy of mutant mouse brains, the expression of dynorphin (OMIM Ref. No. 131340) was greatly reduced in the striatum and related regions of the basal ganglia. The mutant mice did not respond to the stimulant and suppressive effects of D1 receptor agonists and antagonists, respectively, and they exhibited locomotor hyperactivity.

[24722] It is appreciated that the abovementioned animal model for DRD1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24723] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24724] Dearry, A.; Gingrich, J. A.; Falardeau, P.; Fremeau, R. T., Jr.; Bates, M. D.; Caron, M. G. : Molecular cloning and ex-

pression of the gene for a human D(1) dopamine receptor. Nature 347: 72- 76, 1990. ; and

[24725] Xu, M.; Moratalla, R.; Gold, L. H.; Hiroi, N.; Koob, G. F.; Graybiel, A. M.; Tonegawa, S. : Dopamine D1 receptor mutant mice are deficient in striatal expression of dynorphin and in do.

[24726] Further studies establishing the function and utilities of DRD1 are found in John Hopkins OMIM database record ID 126449, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dopamine receptor d2 (DRD2, Accession NP_000786.1) is another GAM148 target gene, herein designated TARGET GENE. DRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRD2 BINDING SITE, designated SEQ ID:2357, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24727] Another function of GAM148 is therefore inhibition of Dopamine receptor d2 (DRD2, Accession NP_000786.1), a gene which has a key role in the control of movement. and

therefore may be associated with Hereditary autosomal dominant myoclonus dystonia. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of Hereditary autosomal dominant myoclonus dystonia, and of other diseases and clinical conditions associated with DRD2.

[24728] The function of DRD2 has been established by previous studies. Bunzow et al. (1988) cloned the rat gene for D2 dopamine receptor. Grandy et al. (1989) cloned the human gene from a pituitary cDNA library. The deduced protein sequence is 96% identical to that of the rat receptor with 1 major difference: the human receptor contains an additional 29 amino acids in its putative third cytoplasmic loop. Southern blot analysis demonstrated the presence of only 1 human DRD2 gene. The coding sequence is interrupted by 6 introns. The additional amino acids present in the human pituitary receptor are encoded by a single exon of 87 basepairs. Eubanks et al. (1992) found that the DRD2 gene extends over 270 kb and includes an intron of approximately 250 kb separating the putative first exon from the exons encoding the receptor protein. They prepared a physical map spanning more than 1.5 Mb of chromosome 11q23, which demonstrated that the neural cell

adhesion molecule gene (NCAM; 116930) is located 150 kb 3- prime of the DRD2 gene and is transcribed from the same DNA strand. High resolution fluorescence in situ suppression hybridization using cosmid and YAC clones localized these genes between the APOA1 and STMY genes at the interface of 11q22.3 and 11q23.1. In situ hybridization studies showed, furthermore, that the DRD2/NCAM complex resides telomeric to the STMY1 gene and centromeric of the APOA1 gene.

[24729] Animal model experiments lend further support to the function of DRD2. Balk et al. (1995) used homologous recombination to generate D2- receptor- deficient mice. Absence of D2 receptors led to animals that were akinetic and bradykinetic in behavioral tests and showed significantly reduced spontaneous movements. The phenotype resembled Parkinson disease. Maldonado et al. (1997) studied the behavior of DRD2 knockout mice and showed that there was a total suppression of rewarding behavior with morphine. In contrast, these animals showed normal responses when food was used as a reward.

[24730] It is appreciated that the abovementioned animal model for DRD2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[24731] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24732] Eubanks, J. H.; Djabali, M.; Selleri, L.; Grandy, D. K.; Civelli, O.; McElligott, D. L.; Evans, G. A. : Structure and linkage of the D2 dopamine receptor and neural cell adhesion molecule genes on human chromosome 11q23. Genomics 14: 1010- 1018, 1992. ; and

[24734] Further studies establishing the function and utilities of DRD2 are found in John Hopkins OMIM database record ID 126450, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dopamine receptor d2 (DRD2, Accession NP_057658.2) is another GAM148 target gene, herein designated TARGET GENE. DRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRD2 BINDING SITE, designated SEQ ID:2357, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24735] Another function of GAM148 is therefore inhibition of Dopamine receptor d2 (DRD2, Accession NP_057658.2), a gene which has a key role in the control of movement. and therefore may be associated with Hereditary autosomal dominant myoclonus dystonia. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of Hereditary autosomal dominant myoclonus dystonia, and of other diseases and clinical conditions associated with DRD2.

[24736] The function of DRD2 has been established by previous studies. Bunzow et al. (1988) cloned the rat gene for D2 dopamine receptor. Grandy et al. (1989) cloned the human gene from a pituitary cDNA library. The deduced protein sequence is 96% identical to that of the rat receptor with 1 major difference: the human receptor contains an additional 29 amino acids in its putative third cytoplasmic loop. Southern blot analysis demonstrated the presence of only 1 human DRD2 gene. The coding sequence is interrupted by 6 introns. The additional amino acids present in

the human pituitary receptor are encoded by a single exon of 87 basepairs. Eubanks et al. (1992) found that the DRD2 gene extends over 270 kb and includes an intron of approximately 250 kb separating the putative first exon from the exons encoding the receptor protein. They prepared a physical map spanning more than 1.5 Mb of chromosome 11q23, which demonstrated that the neural cell adhesion molecule gene (NCAM; 116930) is located 150 kb 3- prime of the DRD2 gene and is transcribed from the same DNA strand. High resolution fluorescence in situ suppression hybridization using cosmid and YAC clones localized these genes between the APOA1 and STMY genes at the interface of 11q22.3 and 11q23.1. In situ hybridization studies showed, furthermore, that the DRD2/NCAM complex resides telomeric to the STMY1 gene and centromeric of the APOA1 gene.

[24737] Animal model experiments lend further support to the function of DRD2. Balk et al. (1995) used homologous recombination to generate D2- receptor- deficient mice. Absence of D2 receptors led to animals that were akinetic and bradykinetic in behavioral tests and showed significantly reduced spontaneous movements. The phenotype resembled Parkinson disease. Maldonado et al. (1997)

studied the behavior of DRD2 knockout mice and showed that there was a total suppression of rewarding behavior with morphine. In contrast, these animals showed normal responses when food was used as a reward.

[24738] It is appreciated that the abovementioned animal model for DRD2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24739] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24740] Eubanks, J. H.; Djabali, M.; Selleri, L.; Grandy, D. K.; Civelli, O.; McElligott, D. L.; Evans, G. A. : Structure and linkage of the D2 dopamine receptor and neural cell adhesion molecule genes on human chromosome 11q23. Genomics 14: 1010- 1018, 1992. ; and

[24741] Maldonado, R.; Salardi, A.; Valverde, O.; Samad, T. A.; Roques, B. P.; Borrelli, E. : Absence of opiate rewarding effects in mice lacking dopamine D2 receptors. Nature 388: 586- 589, 19.

[24742] Further studies establishing the function and utilities of DRD2 are found in John Hopkins OMIM database record ID 126450, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Egf-like-domain, multiple 4 (EGFL4, Accession XP_290821.1) is another GAM148 target gene, herein designated TARGET GENE. EGFL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EGFL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:14622, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24743] Another function of GAM148 is therefore inhibition of Egf-like-domain, multiple 4 (EGFL4, Accession XP_290821.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4.

[24744] Egl nine homolog 2 (c. elegans) (EGLN2, Accession NP_060025.1) is another GAM148 target gene, herein designated TARGET GENE. EGLN2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EGLN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:15451, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24745] Another function of GAM148 is therefore inhibition of Egl nine homolog 2 (c. elegans) (EGLN2, Accession NP_060025.1), a gene which is an essential component of the pathway. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN2.

[24746] The function of EGLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Early growth response 2 (krox-20 homolog, drosophila) (EGR2, Accession NP_000390.2) is another GAM148 target gene, herein designated TARGET GENE. EGR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EGR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGR2 BINDING SITE, designated SEQ ID:791, to the nucleotide sequence of GAM148 RNA, herein designated

GAM RNA, also designated SEQ ID:280.

[24747] Another function of GAM148 is therefore inhibition of Early growth response 2 (krox-20 homolog, drosophila) (EGR2, Accession NP_000390.2), a gene which binds to two specific dna sites located in the promoter region of hox- 1.4. and therefore is associated with Congenital hypomyelination, charcot- marie- tooth desease type 1, dejerine- sottas syndrome. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of Congenital hypomyelination, charcot- marie- tooth desease type 1, dejerine- sottas syndrome, and of other diseases and clinical conditions associated with EGR2.

[24748] The function of EGR2 has been established by previous studies. Timmerman et al. (1999) screened 170 unrelated neuropathy patients and identified 2 with Dejerine- Sottas neuropathy (DSN; 145900) who had a heterozygous R359W mutation (129010.0004) in the alpha- helix domain of the first zinc finger of EGR2. Boerkoel et al. (2001) reported 2 additional DSN patients with the R359W mutation and suggested that it is the most common neuropathy- associated EGR2 mutation and consistently causes DSN. The expressivity ranged from that typical for DSN to a more rapidly progressive neuropathy that can cause

death by age 6 years. Furthermore, in contrast to patients with typical DSN, patients with the EGR2 R359W mutation had more respiratory compromise and cranial nerve involvement.

[24749] Animal model experiments lend further support to the function of EGR2. Congenital hypomyelinating neuropathy (CHN; 605253) is characterized clinically by early onset of hypotonia, areflexia, distal muscle weakness, and very slow nerve conduction velocities. Warner et al. (1997, 1998) noted that pathologic findings on sural nerve biopsies show hypomyelination of most or all fibers. Based on these findings, CHN is considered to be a result of congenital impairment in myelin formation. The disorder is inherited as an autosomal recessive. The EGR2 gene attracted the attention of Warner et al. (1997, 1998) as a potential candidate for CHN because of the expression and knockout phenotype of its mouse homolog, Krox20. Krox20, a member of a multigene family of zinc finger proteins, is thought to function as an immediate early protein with basal expression in selected neuronal populations of the central and peripheral nervous systems. Krox20 knockout mice showed disrupted hindbrain segmentation and development and a block of Schwann cells

at an early stage of differentiation as evidenced by the fact that the expression of early myelin genes, such as myelin- associated glycoprotein (OMIM Ref. No. 159460), are barely affected while the expression of the late myelin genes, myelin basic protein (OMIM Ref. No. 159430) and myelin protein zero (MPZ; 159440), are decreased or absent.

[24750] It is appreciated that the abovementioned animal model for EGR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24751] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24752] Timmerman, V.; De Jonghe, P.; Ceuterick, C.; De Vriendt, E.; Lofgren, A.; Nelis, E.; Warner, L. E.; Lupski, J. R.; Martin, J.- J.; Van Broeckhoven, C. : Novel missense mutation in the early growth response 2 gene associated with Dejerine- Sottas syndrome phenotype. Neurology 52: 1827-1832, 1999. ; and

[24753] Warner, L. E.; Mancias, P.; Butler, I. J.; McDonald, C. M.; Keppen, L.; Koob, K. G.; Lupski, J. R. : Mutations in the early growth response 2 (EGR2) gene are associated with

hereditary.

[24754] Further studies establishing the function and utilities of EGR2 are found in John Hopkins OMIM database record ID 129010, and in cited publications listed in Table 5, which are hereby incorporated by reference.Elongation of very long chain fatty acids (fen1/elo2, sur4/elo3, yeast)-like 3 (ELOVL3, Accession NP_689523.1) is another GAM148 target gene, herein designated TARGET GENE. ELOVL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ELOVL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELOVL3 BINDING SITE, designated SEQ ID:14478, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24755] Another function of GAM148 is therefore inhibition of Elongation of very long chain fatty acids (fen1/elo2, sur4/elo3, yeast)-like 3 (ELOVL3, Accession NP_689523.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL3.

[24756] Eyes absent homolog 2 (drosophila) (EYA2, Accession

NP_742109.1) is another GAM148 target gene, herein designated TARGET GENE. EYA2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EYA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EYA2 BINDING SITE, designated SEQ ID:15962, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24757] Another function of GAM148 is therefore inhibition of Eyes absent homolog 2 (drosophila) (EYA2, Accession NP_742109.1), a gene which may be involved in development of the eye. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA2.

[24758] The function of EYA2 has been established by previous studies. Abdelhak et al. (1997) identified, by positional cloning, a gene at 8q13.3, which contains mutations in patients with branchiootorenal dysplasia (BOR; 113650). The gene is a human homolog of the Drosophila 'eyes absent' (eya), and was therefore called EYA1 (OMIM Ref. No. 601653). A highly conserved 271- amino acid C- terminal

region was also found in the products of 2 other human genes that were subsequently called EYA2 and EYA3 (OMIM Ref. No. 601655), demonstrating the existence of a novel gene family. Some of these other members of the EYA gene family may underlie developmental defects because Abdelhak et al. (1997) demonstrated that all 3 of these genes are expressed in the ninth week of human development. Gene identification strategies that rely on cross- species comparison are based on the observation that functionally significant regions of the genome are highly conserved during evolution. Banfi et al. (1996) applied the power of Drosophila genetics to the vast resource of human cDNAs represented in the expressed sequence tag (EST) database to identify novel human genes of biologic interest. One human cDNA (GenBank H07988) showing significant homology to the gene causing the Drosophila mutant phenotype 'clift' ('eyes absent') was reported by Abdelhak et al. (1997) to be the EYA2 gene. Banfi et al. (1996) mapped the human gene to 20q13.1 using both fluorescence in situ hybridization and radiation hybrid mapping. Zimmerman et al. (1997) mapped the mouse Eya2 gene to chromosome 2 in a region syntenic with human 20q13. Duncan et al. (1997) likewise mapped

EYA2 to human 20q13.1 and Eya2 to mouse chromosome 2. Duncan et al. (1997) found that Eya2 shows a dynamic pattern of expression during mouse development. Its expression was first detected in 8.5- day embryos in the region of head ectoderm fated to become the forebrain. At later stages of development, Eya2 was expressed in the olfactory placode and in a variety of neural crest derivatives. In the eye, expression of Eya2 was first detected after formation of the lens vesicle. At day 17.5, the highest level of Eya2 mRNA was observed in primary lens fibers. Low levels of Eya2 expression were detected in retina, sclera, and cornea. Duncan et al. (1997) stated that, although Eya2 is expressed relatively late in eye development, it belongs to a growing list of factors that may be essential for eye development among metazoan phyla. Like members of the PAX6 gene family (see OMIM Ref. No. 607108), 'eyes absent' gene family members were probably first involved in functions not related to vision, with recruitment for visual system formation and function occurring later. Xu et al. (1997) showed that in the limbs of 10.5- day mouse embryos, Eya1 expression was largely restricted to the flexor tendons, whereas Eya2 was expressed in the extensor tendons and probably also in the

ligaments of the phalanges. They demonstrated that the proline/serine/threonine- rich N- terminal regions of the protein products of the Eya1, Eya2, and Eya3 genes have transcriptional activator activity. These results supported a role for the Eya genes in connective tissue patterning in the limbs.

[24759]

[24760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24761] Abdelhak, S.; Kalatzis, V.; Heilig, R.; Compain, S.; Samson, D.; Vincent, C.; Weil, D.; Cruaud, C.; Sahly, I.; Leibovici, M.; Bitner- Glindzicz, M.; Francis, M.; Lacombe, D.; Vigneron, J.; Charachon, R.; Boven, K.; Bedbeder, P.; Van Rege- morter, N.; Weissenbach, J.; Petit, C. : A human homo- logue of the Drosophila eyes absent gene underlies bran- chio- oto- renal (BOR) syndrome and identifies a novel gene family. Nature Genet. 15: 157- 164, 1997. ; and

[24762] Xu, P.- X.; Cheng, J.; Epstein, J. A.; Maas, R. L. : Mouse Eya genes are expressed during limb tendon development and encode a transcriptional activation function. Proc. Nat. Acad. Sci. 9.

[24763] Further studies establishing the function and utilities of

EYA2 are found in John Hopkins OMIM database record ID 601654, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ00024 (Accession NP_203745.1) is another GAM148 target gene, herein designated TARGET GENE. FLJ00024 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:5939, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24764] Another function of GAM148 is therefore inhibition of FLJ00024 (Accession NP_203745.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[24765] FLJ00024 (Accession XP_033361.2) is another GAM148 target gene, herein designated TARGET GENE. FLJ00024 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:5939, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24766] Another function of GAM148 is therefore inhibition of FLJ00024 (Accession XP_033361.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[24767] FLJ10035 (Accession NP_110430.4) is another GAM148 target gene, herein designated TARGET GENE. FLJ10035 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ10035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10035 BINDING SITE, designated SEQ ID:7021, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24768] Another function of GAM148 is therefore inhibition of FLJ10035 (Accession NP_110430.4) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10035.

[24769] FLJ10496 (Accession NP_060584.2) is another GAM148 target gene, herein designated TARGET GENE. FLJ10496 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10496, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10496 BINDING SITE, designated SEQ ID:11635, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24770] Another function of GAM148 is therefore inhibition of FLJ10496 (Accession NP_060584.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10496.

[24771] FLJ14451 (Accession NP_116175.1) is another GAM148 target gene, herein designated TARGET GENE. FLJ14451 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14451, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ14451 BINDING SITE, designated SEQ ID:19096, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24772] Another function of GAM148 is therefore inhibition of FLJ14451 (Accession NP_116175.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14451.

[24773] FLJ14775 (Accession NP_116226.1) is another GAM148 target gene, herein designated TARGET GENE. FLJ14775 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ14775, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14775 BINDING SITE, designated SEQ ID:18575, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24774] Another function of GAM148 is therefore inhibition of FLJ14775 (Accession NP_116226.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14775.

[24775] FLJ20273 (Accession NP_061900.1) is another GAM148 target gene, herein designated TARGET GENE. FLJ20273 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20273, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20273 BINDING SITE, designated SEQ ID:9599, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24776] Another function of GAM148 is therefore inhibition of FLJ20273 (Accession NP_061900.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20273.

[24777] FLJ21919 (Accession NP_075391.2) is another GAM148 target gene, herein designated TARGET GENE. FLJ21919 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21919, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ21919 BINDING SITE, designated SEQ ID:19653, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24778] Another function of GAM148 is therefore inhibition of FLJ21919 (Accession NP_075391.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21919.

[24779] FLJ23033 (Accession NP_078962.2) is another GAM148 target gene, herein designated TARGET GENE. FLJ23033 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23033, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23033 BINDING SITE, designated SEQ ID:496, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24780] Another function of GAM148 is therefore inhibition of FLJ23033 (Accession NP_078962.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23033.

[24781] FLJ31100 (Accession NP_775902.1) is another GAM148 target gene, herein designated TARGET GENE. FLJ31100 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31100, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31100 BINDING SITE, designated SEQ ID:17843, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24782] Another function of GAM148 is therefore inhibition of FLJ31100 (Accession NP_775902.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31100.

[24783] FLJ32468 (Accession NP_660090.1) is another GAM148 target gene, herein designated TARGET GENE. FLJ32468 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32468, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32468 BINDING SITE, designated SEQ ID:3196, to the

nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24784] Another function of GAM148 is therefore inhibition of FLJ32468 (Accession NP_660090.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32468.

[24785] FLJ32780 (Accession NP_659402.1) is another GAM148 target gene, herein designated TARGET GENE. FLJ32780 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32780, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32780 BINDING SITE, designated SEQ ID:20150, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24786] Another function of GAM148 is therefore inhibition of FLJ32780 (Accession NP_659402.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32780.

[24787] FLJ35487 (Accession NP_776181.1) is another GAM148
